HOW TO USE THIS MANUAL

This manual is arranged in two sections:

Truck Section

Truck sections are grouped by manufacturer and arranged in alphabetical order. The text and illustrations that comprise the service procedures in each Truck Section are arranged in the following order of systems and components: Specifications, Engine Electrical, Chassis Electrical, Engine Cooling, Fuel System, Emission Controls, Engine Mechanical, Engine Lubrication, Manual Transmission, Manual Transaxle, Clutch, Automatic Transmission, Automatic Transaxle, Transfer Case, Drive Axle, Steering, Brakes, Front Suspension, Rear Suspension.

Specification charts are always located at the front of each section. All illustrations are located as close as possible to the pertinent text. Procedures are for all models in the particular section unless specifically noted otherwise.

Unit Repair Section

The Unit Repair Section contains troubleshooting and overhaul procedures for the major components and systems of your truck. This portion of the book is intended to be used in conjunction with the Truck Sections.

For example: If your car's engine is misfiring, and you do not know the cause, use the "Troubleshooting" portion of the Unit Repair Section to find the cause and its remedy. If the cause should prove to be defective piston rings which are allowing oil to foul the spark plugs, the remedy is to overhaul the engine. Then turn to the proper Truck Section to find the procedure for removing the engine from the truck. After you have removed the engine, turn to the "Engine Rebuilding" chapter in the Unit Repair Section and follow the steps listed there to overhaul the engine.

Locating Information

The Table of Contents, at the front of the book, lists the beginning of each Truck and Unit Repair Section in the manual. The Index, at the front of each section, is a comprehensive listing of all major mechanical sections and systems for every section in the book.

To find where a particular Truck Section is located in the book, you need only look in the Table of Contents. Once you have found the proper section, you may wish to find where specific procedures are located in that section. Turn to the Index at the front of the section. At the upper left-hand side is a listing of the main topics within the section and the page number they will be found on. Following the main topics is an alphabetical listing of all the procedures within the section and their page numbers.

Safety Notice

Proper service and repair procedures are vital to the safe, reliable operation of all motor vehicles, as well as the personal safety of those performing repairs. This manual outlines procedures for servicing and repairing vehicles using safe effective methods. The procedures contain many NOTES, CAUTIONS and WARNINGS which should be followed along with standard safety procedures to eliminate the possibility of personal injury or improper service which could damage the vehicle or compromise its safety.

It is important to note that repair procedures and techniques, tools and parts for servicing motor vehicles, as well as the skill and experience of the individual performing the work vary widely. It is not possible to anticipate all of the conceivable ways or conditions under which vehicles may be serviced, or to provide cautions as to all of the possible hazards that may result. Standard and accepted safety precautions and equipment should be used when handling toxic or flammable fluids, and safety goggles or other protection should be used during cutting, grinding, chiseling, prying, or any other process that can cause material removal or projectiles.

Some procedures require the use of tools specially designed for a specific purpose. Before substituting another tool or procedure, you must be completely satisfied that neither your personal safety, nor the performance of the vehicle will be endangered.

Part Numbers

Part numbers listed in this book are not recommendations by Chilton for any product by brand name. They are references that can be used with interchange manuals and aftermarket supplier catalogs to locate each brand supplier's discrete part number.

Although information in this manual is based on industry sources and is as complete as possible at the time of publication, the possibility exists that some car manufacturers made later changes which could not be included here. Information on very late models may not be available in some circumstances. While striving for total accuracy, Chilton Book Company cannot assume responsibility for any errors, changes, or omissions that may occur in the compilation of this data.

Copyright Notice

No part of this publication may be reproduced, transmitted or stored in any form or by any means, electronic or mechanical, including photocopy, recording or by information storage or retrieval system without prior written permission from the publisher.

VEHICLE IDENTIFICATION CHART

It is important for servicing and ordering parts to be certain of the vehicle and engine identification. The VIN (vehicle identification number) is a 17 digit number visible through the windshield on the driver's side of the dash and contains the vehicle and engine identification codes. The tenth digit indicates model year and the eighth digit indicates engine code. It can be interpreted as follows:

Engine Code					
Code	Cu. In.	Liters	Cyl.	Fuel Sys.	Eng. Mfg.
H	225	3.7	6	1 BBL carb.	Chrysler
X	239	3.9	6	EFI	Chrysler
T	318	5.2	8	2 BBL carb.	Chrysler
Y	318	5.2	8	EFI	Chrysler
W ^①	360	5.9	8	4 BBL carb.	Chrysler
I ^②	360	5.9	8	4 BBL carb.	Chrysler
Z	360	5.9	8	EFI	Chrysler
5 ^③	360	5.9	8	EFI	Chrysler
8	360	5.9	6	Turbo Diesel	Cummins

① Federal

② California

③ Heavy Duty Chassis

Model Year	
Code	Year
G	1986
H	1987
J	1988
K	1989
L	1990

FIRING ORDERS

NOTE: To avoid confusion, always replace spark plug wires one at a time.

Chrysler 3.7L (225 cu. in.)
Firing order: 1-5-3-6-2-4
Distributor rotation: clockwise

Cummins 5.9L (360 cu. in.) Turbodiesel
Firing order: 1-5-3-6-2-4

Chrysler 3.9L (239 cu. in.)
Firing order: 1-6-5-4-3-2
Distributor rotation: clockwise

Chrysler 5.2L (318 cu. in.) and 5.9L (360 cu. in.)
Firing order: 1-8-4-3-6-5-7-2
Distributor rotation: clockwise

① A-904T/A-999/A-998 Transmissions—17.1 pts.

A-727 Transmission with lockup—16.7 pts.

A-727 Transmission without lockup—17.1 pts.

② Chrysler 8³/₈ in.—4.5 pts.

Chrysler 9¹/₄ in.—4.5 pts.

Spicer or Dana 60—6.0 pts.

Dana 70—7.0 pts.

③ Front axle except W250 and W350—5.6 pts.

Front axle—W250 and W350—6.5 pts.

④ Standard—22 gals. (metal)

Optional—36 gals. (plastic)

⑤ Sport Utility—35 gals.

Light truck standard—20 gals.

Light truck optional—30 gals.

⑥ Add 2 qts. with air conditioning or max cooling

⑦ Add 1 qt. with air conditioning or increased cooling

⑧ Add 1 qt. when equipped with rear heater

⑨ Add 1/2 qt. with 20 inch tall radiator

⑩ Standard—22 gals.

Optional—35 gals.

⑪ Standard—22 gals.

Optional—30 gals.

⑫ A500 Transmission—20.4 pts.

⑬ Rear axle—7.0 pts.

Front axle—6.3 pts.

⑭ With manual transmission—15.5 qts.

With automatic transmission—16.5 qts.

① Intake—44.5 degrees—45 degrees
Exhaust—42.5 degrees—43 degrees

② Intake—170—184 lbs.
Exhaust—318 CID (5.2L) and 239 CID (3.9L)—180—194 lbs.
Exhaust—360 CID (5.9L)—181—197 lbs.

③ Intake—1.625—1.688 in.
Exhaust—1.453—1.516 in.

④ Intake—30 degrees
Exhaust—45 degrees

⑤ Minimum acceptable load at 1.94 in.

⑥ Free standing length

① King pin inclination

ENGINE ELECTRICAL

NOTE: Disconnecting the negative battery cable on some vehicles may interfere with the functions of the on board computer systems and may require the computer to undergo a relearning process, once the negative battery cable is reconnected.

Distributor

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Disconnect the distributor pick-up lead wires and vacuum hose, if equipped.
3. Unfasten the distributor cap retaining clips and lift off the distributor cap with all ignition wires still connected. Remove the coil wire if necessary.
4. Matchmark the rotor to the distributor housing.

NOTE: Do not crank the engine during this procedure. If the engine is cranked, the matchmark must be disregarded.

5. Remove the hold-down bolt and clamp.

6. Remove the distributor from the engine.

To install:

7. Install a new distributor housing O-ring.
8. Install the distributor in the engine so the rotor is lined up with the matchmark on the housing. Make sure

the distributor is fully seated and that the distributor shaft is fully engaged.

9. If the engine has been cranked, position the engine so that the No. 1 piston is at TDC of the compression stroke and the mark on the vibration damper is lined up with 0 on the timing indicator. Then install the distributor so the rotor is aligned with the position of the No. 1 ignition wire on the distributor cap.

10. Install the hold-down clamp and snug the hold-down bolt.

11. Connect the distributor pickup lead wires.

12. Install the distributor cap and snap the retaining clips into place.

13. Connect the negative battery cable.

14. Adjust the ignition timing and tighten the hold-down bolt.

Ignition Timing

ADJUSTMENT

1. Start the engine, set the parking brake and run the engine until at normal operating temperature. Keep all lights and accessories **OFF**.

2. If a magnetic timing unit is available, insert the probe into the receptacle near the timing scale. The scale is located on the timing chain cover above and to the left of the vibration damper on Pick-Ups and below the damper on Vans.

3. If a magnetic timing unit is not available, connect a conventional power timing light to the No. 1 cylinder spark plug wire.

4. Connect the red lead of a tachometer to the negative primary terminal of the coil and connect the black lead to a good ground.

5. If the vehicle is equipped with a carburetor, ground the carburetor switch with a jumper wire. Set the idle speed according to the Vehicle Emission Control Information (VECI) label. Disconnect and plug the distributor vacuum advance hose at the distributor or computer, if equipped.

6. If the vehicle is equipped with Electronic Fuel Injection (EFI), connect the Diagnostic Readout Box II (DRBII) and access the Basic Timing Mode. If the DRBII is not available, disconnect the coolant sensor located near the thermostat housing and confirm that the Check Engine lamp on the instrument panel is **ON**.

7. Aim the timing light at the timing scale or read the magnetic timing unit.

8. If the timing is advanced (higher than the specification on the VECI label), the distributor should be turned clockwise. If the timing is retarded, (lower than the specification on the

VECI label), the distributor should be turned counterclockwise.

9. Loosen the distributor hold-down bolt just enough so the distributor can be rotated. Turn the distributor in the proper direction until the specified timing is reached. Tighten the hold-down bolt and recheck the timing and idle speed.

10. Turn the engine off. Remove the jumper wire, if used. Connect the vacuum hose or coolant sensor (make sure the Check Engine lamp does not come on when the vehicle is started). Disconnect the timing apparatus and tachometer.

11. If the coolant temperature sensor was disconnected, erase the created fault code using the Erase Fault Code mode on the DRBII. If the DRBII is not available, the code can be erased by disconnecting the battery, although it is not recommended.

NOTE: If the battery is disconnected, radio memory will be lost and other fault codes that may have been stored in the computer's memory will be erased. If the coolant sensor code is not erased at this point, it will disappear after 50-100 vehicle key on/off cycles providing there is no problem with that circuit.

Alternator

For further information on the charging system, please refer to "Charging and Starting" in the Unit Repair section.

BELT TENSION ADJUSTMENT

NOTE: The belt tension is automatically adjusted by the tensioner on the 5.9L diesel engine. Periodic adjustment is not necessary.

1. Loosen the pivot bolt slightly.
2. Loosen the adjuster strap nut or bolt just enough so the alternator can be moved.

3. If the alternator bracket is not equipped with an adjuster bolt, use a suitable pry bar and apply tension to the alternator until the belt(s) deflect about 1/4-1/2 in. under a 10 lb. load. Torque the adjuster strap bolt to 200 inch lbs. (23 Nm). Torque the pivot bolt to 30 ft. lbs. (41 Nm).

4. If the bracket is equipped with an adjuster bolt, tighten it until the belts deflect about 1/2 in. under a 10 lb. load. Torque the adjuster strap nut to 200 inch lbs. (23 Nm). Torque the pivot bolt to 30 ft. lbs. (41 Nm).

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. On the 5.9L diesel engine, use a 3/8 in. drive breaker bar to lift the belt tensioner and remove the belt. On all other engines, loosen the mounting bolts, move the alternator toward the engine and remove the drive belt(s).

NOTE: On some Vans, it may be easier to remove the alternator through the right front wheelwell since the fan shroud and possibly air conditioning and heater plumbing under the hood will prevent removal from in front of the vehicle. Lift the vehicle and safely support to remove the right front wheel and gain access to the alternator on these applications.

3. Remove the mounting bolts, spacers and adjuster bolt, if equipped and remove the alternator from the brackets.

4. Remove the battery positive, field and ground terminals from the rear of the alternator. Remove the wire harness hold-down screw from the alternator, if equipped.

To install:

5. Connect all wiring to the proper terminals on the rear of the alternator and install the wire harness hold-down screw, if equipped.

6. Position the alternator in the mounting brackets.

7. Install the spacers, pivot bolt, adjuster strap bolt or nut and adjuster bolt, if equipped.

8. On the 5.9L diesel engine, torque the upper bolt to 18 ft. lbs. (24 Nm), the lower bolt to 32 ft. lbs. (43 Nm) and install the belt. On all other engines, install the drive belt(s) and adjust to specification. Torque the adjuster strap nut or bolt to 200 inch lbs. (23 Nm). Torque the pivot bolt to 30 ft. lbs. (41 Nm).

9. Connect the negative battery cable.

Chrysler 60 and 78 amp alternator terminals

Chrysler 90HS, 120HS and Nippondenso alternators terminals

Voltage Regulator

For further information on the charging system, please refer to "Charging and Starting" in the Unit Repair section.

REMOVAL & INSTALLATION

NOTE: The voltage regulator is integrated into the circuitry of the Single Module Engine Controller (SMEC) or Single Board Engine Controller (SBEC) on vehicles with EFI and is not serviceable.

1. Disconnect the negative battery cable.
2. Unplug the connector from the voltage regulator.
3. Remove the retaining screws and remove the regulator from the vehicle.
4. The installation is the reversal of the removal procedure. Make sure the connector retainer is properly clipped in place.

Starter

REMOVAL & INSTALLATION

For further information on the charging system, please refer to "Charging and Starting" in the Unit Repair section.

1. Disconnect the negative battery cable.
2. Raise the vehicle and support safely, unless equipped with a 3.7L engine.
3. Remove the heat shield from the starter, if equipped.
4. Disconnect the solenoid lead wires from the starter.
5. Unbolt the starter, remove the exhaust bracket and automatic transmission oil cooler tube bracket, if equipped and remove the starter from the vehicle.

To install:

6. Install the starter to the bellhousing and install the upper mounting bolt loosely.

7. Install the automatic transmission oil cooler tube bracket and exhaust bracket, if equipped. Install the lower mounting nut or bolts. Torque the mounting nut and bolt evenly to 50 ft. lbs. (68 Nm) on all engines except the 5.9L diesel engine. On that engine, torque the mounting bolts to 32 ft. lbs. (43 Nm).

8. Connect the solenoid lead wires.
9. Install the heat shield, if equipped.
10. Connect the negative battery cable and check the starter for proper operation.

Intake Manifold Heater

REMOVAL & INSTALLATION

5.9L Diesel Engine

1. Disconnect the negative battery cable.
2. Disconnect the throttle rod from the throttle lever.
3. Remove the 4 bolts that attach the air crossover to the intake mani-

Rotating the throttle bracket away from the engine

Air crossover tube and turbocharger

fold. Loosen the lower throttle control bracket mounting bolt and move the bracket away from the engine.

4. Loosen the hose clamps on the turbocharger end of the crossover tube and remove the tube and gasket. Cover the turbocharger opening with a clean shop towel.

5. Disconnect the electrical wiring from the intake manifold heater, remove the heater and remove the gasket.

To install:

6. Clean the gasket mounting surface and install a new gasket.

7. Install the intake manifold heater and connect the wiring.

8. Remove the towel from the turbocharger opening and install the air crossover tube and gasket. Tighten the hose clamps.

9. Rotate the throttle control bracket back into place. Torque all mounting bolts to 18 ft. lbs. (24 Nm).

10. Attach the throttle rod to the throttle lever.

TESTING

1. Disconnect the negative battery cable.

2. Disconnect the wires from the intake manifold heater.

INTAKE
MANIFOLD
HEATER

Intake manifold heater and related parts

3. Using an ohmmeter, check the resistance from a good ground to each heater terminal.

4. If there is any resistance, or if the circuit is open, inspect the assembly for dirty or corroded connections.

5. If the resistance is 0Ω , the heater is functioning properly.

6. If the circuit is open, the heater is defective.

CHASSIS ELECTRICAL

Heater Blower Motor

REMOVAL & INSTALLATION

Van Without Air Conditioning

1. Disconnect the negative battery cable.

2. Remove the air intake duct and top half of the fan shroud, if necessary. Disconnect the blower connector.

3. Remove the 7 screws that fasten the back plate to the heater housing.

4. Remove the blower motor from the vehicle.

5. Remove the spring clip fastening the blower wheel to the blower shaft and pull off the wheel.

6. Remove the vent tube.

7. Remove the nuts fastening the blower motor to the back plate and remove the motor.

To install:

8. Check the seal for breaks and adhesion; repair as necessary.

9. Install the blower motor to the back plate.

10. Install the vent tube.

11. Install the blower wheel to the shaft and secure the spring clip.

12. Install the assembly to the heater housing and install the 7 screws.

13. Connect the connector.

14. Install the fan shroud and air duct, if they were removed.

15. Connect the negative battery cable and check the blower motor for proper operation.

Van With Air Conditioning

1. Disconnect the negative battery cable.

2. Remove the air intake duct and top half of the fan shroud.

3. Disconnect the blower connector.

4. Remove the blower motor cooling tube.

5. Remove the retaining nuts and washers from the studs holding the blower.

6. Pull the air conditioning lines in-board and upward while removing the blower assembly from the vehicle. Remove the spring clip fastening the blower wheel to the blower shaft and pull off the wheel.

To install:

7. Install the blower wheel to the shaft and install the spring clip. Inspect the blower mounting plate seal and repair as necessary. Apply rubber adhesive to the seal to aid in assembly.

8. Install the blower into the housing and install the washers and nuts.

9. Install the cooling tube.

10. Connect the connector.

11. Install the fan shroud and air intake duct.

12. Connect the negative battery cable and check the blower motor for proper operation.

Pick-Up and Ramcharger

1. Disconnect the negative battery cable.

2. Disconnect the blower connector.

3. Remove the blower motor cooling tube.

4. Remove the screws or retaining nuts retaining the blower plate to the housing.

Underhood location of the blower motor—Van with air conditioning

5. Remove the assembly from the housing.

6. Remove the spring clip fastening the blower wheel to the blower shaft and pull off the wheel. Remove the blower from the plate.

To install:

7. Inspect the blower mounting plate seal and repair as necessary.

8. Install the blower to the plate. Install the blower wheel to the shaft and install the spring clip.

9. Install the blower into the housing and install the screws or washers and nuts.

10. Install the cooling tube.

11. Connect the connector.

12. Connect the negative battery cable and check the blower motor for proper operation.

6. Remove the motor from the vehicle.

7. Hold the crank arm with a wrench while removing the crank nut to prevent from overloading the gears.

8. Remove the crank arm from the motor.

To install:

9. Index the slot correctly and position the crank arm on the motor shaft. Start the crank nut making sure the crank arm does not move from its slotted position.

10. Hold the crank arm with a wrench and torque the nut to 95 inch lbs. (11 Nm).

11. Lubricate the drive link retainer bushing and install the crank arm pin to the bushing by snapping them together suitable pliers.

12. Install the motor to the vehicle and torque the mounting bolts to 65 inch lbs. (7 Nm).

13. Connect the wires to the motor.

14. Connect the negative battery cable and check the wiper motor for proper operation.

2. Remove the lower column cover, if equipped.

3. Remove the 2 screws retaining the switch from under the instrument panel.

4. Disconnect the connector and illumination lamp.

5. Remove the assembly from under the instrument panel and remove the switch from the housing.

6. The installation is the reversal of the removal procedure.

7. Connect the negative battery cable and check the switch for proper operation.

PICK-UP AND RAMCHARGER

1. Disconnect the negative battery cable.

2. Remove the map light.

3. Remove 6 screws which attach the faceplate to the base panel. There is a screw below the heater-air conditioning control panel which is not visible from above.

4. If equipped with automatic transmission, place the shift lever in its lowest position.

5. Remove the faceplate by pulling the top edge rearward to clear the brow and pulling the bottom out, disengaging the attaching clips. If the vehicle is equipped with 4WD, disconnect the indicator wires.

6. Reach under the instrument panel, depress the spring button and remove the headlight switch knob.

7. Pull the wiper switch knob off the lever. Remove the power mirror

Windshield Wiper Motor

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Disconnect the wires from the wiper motor.

3. Remove the mounting bolts.

4. Pull the motor out far enough to gain access to the crank arm to motor link retainer bushing.

5. Remove the crank arm from the drive link by prying the retainer bushing from the crank arm pin with a suitable prying tool.

Windshield Wiper Switch

REMOVAL & INSTALLATION

Dash-Mounted

VAN

1. Disconnect the negative battery cable.

Typical Van windshield wiper motor and linkage

switch knob, if equipped.

8. Remove the bezel.

9. Remove the screws attaching the wiper switch to the instrument panel, disconnect the wiring and remove the switch from the vehicle.

To install:

10. Connect the wiring to the switch and install the switch to the instrument panel.

11. Install the bezel.

12. Install the headlight stem and wiper switch knob. Install the power mirror switch knob, if removed.

13. Connect the 4WD indicator if equipped, install the cluster faceplate and map light.

14. Connect the negative battery cable and check the switch for proper operation.

Column-Mounted

EXCEPT TILT WHEEL

1. Disconnect the negative battery cable.

2. Remove the lower steering column cover, if equipped.

3. Remove the horn pad mounting screws from behind the steering wheel and remove the horn pad.

4. Remove the steering wheel nut, matchmark the steering wheel to the shaft and remove the steering wheel with a suitable puller.

5. Remove the plastic wiring channel from the underside of the steering column.

6. Disconnect the wiper switch con-

necter, intermittent wipe module connector and cruise control connector, if equipped.

7. Remove the side lock housing cover.

8. Remove the slotted hex-head screw that attaches the wiper switch to the turn signal switch and remove the switch.

9. Remove the control knob from the end of the stalk. Pull the round ny-

lon hider up the control stalk and remove the revealed screws that attach the control stalk sleeve to the wiper switch.

10. Rotate the control stalk shaft to the full clockwise position and remove the shaft from the wiper switch by pulling it straight out.

To install:

11. Install the control shaft to the wiper switch, install the screws, the

Typical steering column wiring harness

Removing the wiper switch—standard column

hider and the control knob.

12. Run the wiring through the opening and down the steering column, position the switch and install the hex-head screw. Make sure the dimmer switch rod is properly engaged.

13. Install the side lock housing cover.

14. Connect the wires and install the wiring channel.

15. Install the steering wheel torque the nut to 45 ft. lbs. (61 Nm).

16. Install the horn pad.

17. Connect the negative battery cable and check the wiper and washer, cruise control, turn signal switch and dimmer switch for proper operation.

18. Install the lower column cover, if equipped.

TILT WHEEL

1. Disconnect the negative battery cable.

2. Remove the lower steering column cover, if equipped and remove the plastic wiring channel from the underside of the steering column.

3. Remove the horn pad mounting screws from behind the steering wheel and remove the horn pad.

4. Remove the steering wheel nut, matchmark the steering wheel to the shaft and remove the steering wheel with a suitable puller.

5. Depress the lock plate with the proper depressing tool, remove the retaining ring from its groove and remove the tool, ring, lock plate, cancelling cam and spring.

6. Remove the switch stalk actuator screw and arm.

7. Remove the hazard switch knob.

8. Disconnect the turn signal switch, wiper switch, intermittent module and cruise control connectors, if equipped.

9. Remove the 3 screws and remove the turn signal switch. Tape the connector to the wires to aid in removal.

10. Remove the ignition key lamp.

11. Place the key in the **LOCK** position and remove the key. Insert a thin tool into the slot next to the switch mounting screw boss, depress the spring latch at the bottom of the slot releasing the lock. Remove the lock cylinder.

12. Remove the buzzer switch and wedge spring.

13. Remove the 3 housing cover screws and remove the housing cover.

14. Remove the wiper switch pivot pin with a punch and remove the switch.

15. Remove the control knob from the end of the stalk. Pull the round nylon hider up the control stalk and remove the revealed screws that attach the control stalk sleeve to the wiper switch.

16. Rotate the control stalk shaft to the full clockwise position and remove the shaft from the wiper switch by pulling it straight out.

To install:

17. Install the control shaft to the wiper switch, install the screws, the hider and the control knob.

18. Run the wiring through the opening and down the steering column, position the switch and install the wiper switch pivot pin.

19. Install the housing cover.

20. Install the buzzer switch and wedge spring.

21. Install the lock cylinder.

22. Install the ignition key lamp.

23. Install the turn signal switch, switch stalk actuator arm and hazard switch knob.

24. Install the spring, cancelling

cam, lock plate and ring on the steering shaft. Depress the plate with the depressing tool and install the ring securely in the groove. Remove the tool slowly.

25. Connect the turn signal switch, wiper switch, intermittent module and cruise control connectors, if equipped. Install the channel.

26. Install the steering wheel torque the nut to 45 ft. lbs. (61 Nm).

27. Install the horn pad.

28. Connect the negative battery cable and check the wiper and washer, cruise control, turn signal switch and dimmer switch for proper operation.

29. Install the lower column cover, if equipped.

Instrument Cluster

REMOVAL & INSTALLATION

Van

1. Disconnect the negative battery cable.

2. Open the glove box. Remove the screws that fasten the hood and bezel assembly. Pull the bezel off of the upper retaining clips.

3. Disconnect the gearshift pointer cable from the arm on the steering column, if equipped.

4. Remove the cluster screws. Pull the cluster out far enough to disconnect the speedometer cable by releasing the spring clip.

5. Remove all printed circuit board multiple connectors and the message center connector.

6. Remove the cluster assembly.

7. To remove the speedometer, remove the cluster lens, unplug the Emissions Maintenance Reminder (EMR) timer wires from the speedometer, if equipped and remove the retaining screws.

To install:

8. Install the speedometer if removed and connect the EMR wiring, if equipped. Position the cluster to the panel and connect the speedometer cable, multiple connectors and message center connector.

9. Push the cluster in place and install the retaining screws.

10. Connect the gearshift pointer cable to the arm on the steering column, if equipped and adjust if necessary.

11. Install the hood and bezel assembly and install the retaining screws.

12. Connect the negative battery cable.

Pick-Up and Ramcharger

1. Disconnect the negative battery cable.

2. Remove the map light.

3. Remove 6 screws which attach the faceplate to the base panel. There

is a screw below the heater-air conditioning control panel which is not visible from above.

4. If equipped with automatic transmission, place the shift lever in its lowest position.

5. Remove the faceplate by pulling the top edge rearward to clear the brow and pulling the bottom out, disengaging the attaching clips. If the vehicle is equipped with 4WD, disconnect the indicator wires.

6. Remove the upper and lower steering column covers. Disconnect the shift indicator actuator cable from the steering column, if equipped.

7. Loosen the heater and air conditioning control and pull it out enough to clear the cluster housing.

8. Remove the screws that retain the cluster and pull the cluster out far enough to disconnect the speedometer cable by releasing the spring clip.

9. Remove all printed circuit board multiple connectors.

10. Remove the cluster assembly.

11. To remove the speedometer, remove the cluster lens, unplug the EMR timer wires from the speedometer, if equipped and remove the retaining screws.

To install:

12. Install the speedometer if removed and connect the EMR wiring, if equipped. Position the cluster to the panel and connect the speedometer cable and multiple connectors.

13. Push the cluster in place and install the retaining screws.

14. Install the heater air conditioning control screws.

15. Connect the shift indicator actuator cable and check for alignment.

16. Install the upper and lower steering column covers.

17. Connect the 4WD indicator if equipped, install the cluster faceplate and map light.

18. Connect the negative battery cable.

Radio

REMOVAL & INSTALLATION

Van

1. Disconnect the negative battery cable.

2. Open the glove box. Remove the screws that fasten the hood and bezel assembly. Pull the bezel off of the upper retaining clips.

3. Remove the screws that attach the radio to the dash.

4. Pull the radio out, disconnect the connectors, ground cable and antenna and remove the radio.

5. The installation is the reversal of the removal procedure.

Pick-Up and Ramcharger

1. Disconnect the negative battery cable.

2. Remove the map light.

3. Remove 6 screws which attach the faceplate to the base panel. There is a screw below the heater-air conditioning control panel which is not visible from above.

4. If equipped with automatic transmission, place the shift lever in its lowest position.

5. Remove the faceplate by pulling the top edge rearward to clear the brow and pulling the bottom out, disengaging the attaching clips. If the vehicle is equipped with 4WD, disconnect the indicator wires.

6. Remove the screws that attach the radio to the dash.

7. Pull the radio out, disconnect the connectors, ground cable and antenna and remove the radio.

8. The installation is the reversal of the removal procedure.

Headlight Switch

REMOVAL & INSTALLATION

Van

1. Disconnect the negative battery cable.

2. Remove the lower steering column cover, if equipped.

3. Unscrew the hood release handle and lower it.

4. Working under the instrument panel, depress the spring button on the headlight switch and pull the stem out.

5. Open the glove box. Remove the screws that fasten the dash bezel assembly. Pull the bezel off of the upper retaining clips.

6. Remove the switch bezel and remove the illumination bulb socket.

7. Remove the switch mounting nut from the panel, remove the switch and disconnect the wiring.

To install:

8. Connect the switch, install the switch to the panel and install the mounting nut.

9. Install the illumination bulb socket to the switch bezel and install the bezel.

10. Install the dash bezel and headlight switch stem.

11. Connect the negative battery cable and check the switch for proper operation.

12. Install the hood release handle and lower steering column cover.

Pick-Up and Ramcharger

1. Disconnect the negative battery cable.

2. Remove the map light.

Headlight switch removal—Van

3. Remove 6 screws which attach the faceplate to the base panel. There is a screw below the heater-air conditioning control panel which is not visible from above.

4. If equipped with automatic transmission, place the shift lever in its lowest position.

5. Remove the faceplate by pulling the top edge rearward to clear the brow and pulling the bottom out, disengaging the attaching clips. If the vehicle is equipped with 4WD, disconnect the indicator wires.

6. Reach under the instrument panel, depress the spring button and remove the headlight switch knob.

7. Remove the wiper and power mirror switch knobs off their levers, if equipped.

8. Remove the bezel.

9. Remove the switch mounting nut from the panel, remove the switch and disconnect the wiring.

To install:

10. Connect the switch, install the switch to the panel and install the mounting nut.

11. Install the bezel.

12. Install the headlight stem and wiper and power mirror switch knobs, if removed.

13. Connect the 4WD indicator if equipped, install the cluster faceplate and map light.

14. Connect the negative battery cable and check the switch for proper operation.

3. Unbolt the switch from the floor.

4. Unplug the switch and remove it from the vehicle.

5. The installation is the reversal of the removal procedure.

6. Connect the negative battery cable and check the switch for proper operation.

Column-Mounted

1. Disconnect the negative battery cable.

2. Remove the lower steering column cover, if equipped.

3. Unplug the switch.

4. Holding the actuating rod against its upper seat, remove the bolts that attach the switch to the column and remove the switch.

5. The installation is the reversal of the removal procedure. Adjust the switch as required.

6. Connect the negative battery cable and check the switch for proper operation.

Turn Signal Switch

REMOVAL & INSTALLATION

Standard Column

1. Disconnect the negative battery cable.

2. Remove the lower steering column cover, if equipped.

3. Remove the horn pad mounting screws from behind the steering wheel and remove the horn pad.

4. Remove the steering wheel nut, matchmark the steering wheel to the shaft and remove the steering wheel with a suitable puller.

5. Remove the plastic wiring channel from the underside of the steering column and disconnect the turn signal switch connector.

6. Remove the hazard switch knob. Remove the slotted hex-head screw that attaches the wiper switch to the turn signal switch.

7. Remove the 3 screws and pull the turn signal switch out of the column.

To install:

8. Run the wiring through the opening and down the steering column, position the switch and install the hex-head screw. Make sure the dimmer switch rod is properly engaged.

9. Install the 3 screws and the hazard switch knob.

10. Connect the wires and install the wiring channel.

11. Install the steering wheel torque the nut to 45 ft. lbs. (61 Nm).

12. Install the horn pad.

13. Connect the negative battery cable and check the turn signal switch and dimmer switch for proper operation.

14. Install the lower column cover, if equipped.

Dimmer Switch

REMOVAL & INSTALLATION

Floor-Mounted

1. Disconnect the negative battery cable.

2. Raise the carpeting around the switch.

Column mounted dimmer switch location

Tilt Column

1. Disconnect the negative battery cable.

2. Remove the lower steering column cover, if equipped and remove the plastic wiring channel from the underside of the steering column.

3. Remove the horn pad mounting screws from behind the steering wheel and remove the horn pad.

4. Remove the steering wheel nut, matchmark the steering wheel to the shaft and remove the steering wheel with a suitable puller.

5. Depress the lock plate with the proper depressing tool, remove the retaining ring from its groove and remove the tool, ring, lock plate, cancelling cam and spring.

6. Remove the stalk actuator screw and arm.

7. Remove the hazard switch knob.

8. Disconnect the turn signal switch connector.

9. Remove the 3 screws and remove the turn signal switch. Tape the connector to the wires to aid in removal.

To install:

10. Run the wiring through the opening and down the steering column, install the turn signal switch, switch stalk actuator arm and hazard switch knob.

11. Install the spring, cancelling cam, lock plate and ring on the steering shaft. Depress the plate with the depressing tool and install the ring securely in the groove. Remove the tool slowly.

12. Connect the turn signal switch connector and install the channel.

13. Install the steering wheel torque the nut to 45 ft. lbs. (61 Nm).

14. Install the horn pad.

15. Connect the negative battery cable and check the turn signal switch and dimmer switch for proper operation.

16. Install the lower column cover, if equipped.

Removing the key lock cylinder—standard column

5. Remove the 3 screws and pull the turn signal switch out of the column as far as it will go. Unplug it below if necessary.

6. Remove the ignition switch key lamp.

7. Place the key in the **LOCK** position and remove the key.

8. Insert 2 suitable small diameter tools into both release holes and push inward to release the spring loaded lock retainers while simultaneously pulling the key lock cylinder out of its bore.

To install:

9. Install the key cylinder.

10. Install the ignition switch key lamp.

11. Install the turn signal switch and hazard switch knob. Connect the wires if they were disconnected.

12. Install the steering wheel torque the nut to 45 ft. lbs. (61 Nm).

13. Install the horn pad.

14. Connect the negative battery cable and check the lock cylinder for proper operation.

15. Install the lower column cover, if equipped.

Tilt Column

1. Disconnect the negative battery cable.

2. Remove the horn pad mounting screws from behind the steering wheel and remove the horn pad.

3. Remove the steering wheel nut, matchmark the steering wheel to the shaft and remove the steering wheel with a suitable puller.

4. Depress the lock plate with the proper depressing tool, remove the retaining ring from its groove and remove the tool, ring, lock plate, cancelling cam and spring.

5. Remove the stalk actuator screw and arm.

6. Remove the hazard switch knob.

Ignition Lock

REMOVAL & INSTALLATION

Standard Column

1. Disconnect the negative battery cable.

2. Remove the horn pad mounting screws from behind the steering wheel and remove the horn pad.

3. Remove the steering wheel nut, matchmark the steering wheel to the shaft and remove the steering wheel with a suitable puller.

4. Remove the hazard switch knob. Remove the slotted hex-head screw that attaches the wiper switch to the turn signal switch.

Removing the key lock cylinder—tilt column

7. Remove the 3 screws and pull the turn signal switch out of the column as far as it will go. Unplug it below if necessary.

8. Remove the ignition key lamp.

9. Place the key in the **LOCK** position and remove the key. Insert a thin tool into the slot next to the switch mounting screw boss, depress the spring latch at the bottom of the slot releasing the lock and remove the lock cylinder.

To install:

10. Install the lock cylinder.

11. Install the ignition key lamp.

12. Install the turn signal switch, switch stalk actuator arm and hazard switch knob.

13. Install the spring, cancelling cam, lock plate and ring on the steering shaft. Depress the plate with the depressing tool and install the ring securely in the groove. Remove the tool slowly.

14. Connect the wires if they were disconnected.

15. Install the steering wheel torque the nut to 45 ft. lbs. (61 Nm).

16. Install the horn pad.

17. Connect the negative battery cable and check the turn signal switch for proper operation.

18. Install the lower column cover, if it was removed.

Stoplight Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the switch mounting bracket assembly from the brake pedal bracket.

3. Remove the switch from its bracket.

4. The installation is the reversal of the removal procedure.

5. Connect the negative battery cable and check the switch for proper operation.

Fuses and Circuit Breakers

LOCATION

The fuse box is located to the left of the glove box on Vans and directly under the steering column on Pick-Ups and Ramchargers.

ENGINE COOLING

Radiator REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Open the radiator petcock and drain the antifreeze. Once the antifreeze has stopped draining, close the petcock.

3. Remove the upper hose and coolant reserve tank hose from the radiator.

4. Remove the shroud from the radiator and position it away from the radiator.

5. On Vans, remove the upper mounting screws, raise the vehicle and support safely.

6. Remove the lower hose from the radiator.

7. Disconnect the automatic transmission cooler lines, if equipped and plug them.

8. Remove the mounting screws and carefully lift or lower the radiator out of the engine compartment.

To install:

9. Lift or lower the radiator into position and install the mounting screws.

10. Connect the automatic transmission cooler lines, if they were removed.

11. Connect the lower hose.

12. Lower the vehicle and install the remaining mounting screws, if applicable.

13. Install the shroud.

14. Connect the upper hose and coolant reserve tank hose.

15. Fill the system with coolant.

16. Connect the negative battery cable, run the vehicle until the thermostat opens, fill the radiator completely and check the automatic transmission fluid level, if equipped.

17. Once the vehicle has cooled, recheck the coolant level.

Heater Core

REMOVAL & INSTALLATION

Van Without Air Conditioning

1. Disconnect the negative battery cable.

2. Drain the cooling system. Disconnect and plug the heater hoses.

3. Disconnect the temperature control cable from the heater core cover and the blend door crank. Disconnect the vent cable.

4. Disconnect the blower motor connector.

5. Remove the screws retaining the heater assembly to the side cowl and the nuts fastening the heater assembly to the dash panel.

6. Remove the heater unit from the vehicle.

7. Remove the back plate and re-

move the screws holding the heater core cover to the heater housing. Lift the cover from the housing.

8. Remove the retaining screws from the heater core and remove the core from the heater housing.

To install:

9. Clean out the inside of the housing. Place the heater core into the housing and fasten.

10. Position the blend air door and right vent door in the housing and fasten the heater core cover to the housing.

11. Check the dash panel and side cowl seals for breaks and lack of adhesion. Repair as required.

12. Install the heater assembly to the vehicle.

13. Connect the blower connector.

14. Connect the cables.

15. Connect the heater hoses.

16. Refill the radiator.

17. Connect the negative battery cable, run the vehicle until the thermostat opens, fill the radiator completely and check the operation of the heater.

18. Once the vehicle has cooled, recheck the coolant level.

Van With Air Conditioning

1. Disconnect the negative battery cable. Properly discharge the air conditioning system completely.

2. Disconnect the freeze control connector from the wire harness at the H-valve, if equipped.

3. Drain the cooling system. Place a layer of non-conductive waterproof material over the alternator to prevent coolant from spilling on it when disconnecting the heater hoses. Disconnect and cap the heater hoses.

4. Slowly disconnect the refrigerant plumbing from the H valve. Remove the 2 screws from the filter drier bracket and swing the plumbing out of the way towards the center of the vehicle.

5. Remove the temperature control cable from the cover.

6. Working from inside the vehicle, remove the glove box, spot cooler bezel and the appearance shield. Working through the glove box opening and under the instrument panel, remove the screws and nuts attaching the evaporator core housing to the dash panel.

7. Remove the 2 screws from the flange connection to the blower housing. Separate the evaporator core housing from the blower housing.

8. Carefully remove the evaporator core housing from the vehicle.

9. Remove the cover from the housing and remove the screw retaining the strap to heater core. Remove the

Heater core removal—van with air conditioning

heater core from the housing.

To install:

10. Clean the inside of the housing. Place the heater core into the housing and install the retaining strap and screw.

11. Install the housing cover.

12. Install the blower housing to the evaporator housing.

13. Inspect all air seals and mating surfaces for possible breaks and leaks and repair as required.

14. Install the assembly to the dash panel and from inside the vehicle, install the screws and nuts attaching it to the dash panel.

15. Install the appearance shield, spot cooler bezel and glove box.

16. Attach the temperature control cable to the cover.

17. Position the plumbing and install the 2 screws onto the filter drier bracket.

18. Install a new gasket and connect the refrigerant plumbing to the H-valve.

19. Connect the heater hoses and remove the waterproof material from the alternator. Connect the freeze control wire harness, if equipped.

20. Evacuate and recharge the air conditioning system. Refill the radiator.

21. Connect the negative battery cable, run the vehicle until the thermostat opens, fill the radiator completely and check the operation of the entire climate control system.

22. Once the vehicle has cooled, recheck the coolant level.

Pick-Up and Ramcharger Without Air Conditioning

1. Disconnect the negative battery cable.

2. Drain the cooling system. Remove and plug the heater core hoses.

3. Remove the right side cowl trim panel, if equipped. Remove the glove box assembly. Remove the structural brace through the glovebox opening.

4. Remove the right half of the instrument panel lower reinforcement and disconnect the ground strap.

5. Disconnect the control cables from the heater housing and the blower motor wires on the engine side.

6. Remove the retaining screw between the package to cowl side sheet metal.

7. Remove the 6 heater housing retaining nuts on the engine side of the heater assembly and remove the heater housing assembly.

8. Remove the heater housing cover retaining screws and the mode door crank. Separate the cover from the housing.

9. Carefully lift the heater core from the heater housing.

To install:

10. Clean the inside of the housing. Install the heater core into the housing.

11. Install the housing cover.

11. Inspect the dash panel seal for damage and repair as required.

12. Install the assembly to the dash panel and install the retaining nuts.

13. Install the cowl side retaining screws.

14. Connect the blower motor connector.

15. Connect the control cables.

16. Install the right lower instrument panel reinforcement, structural brace, glove box and cowl side trim panel, if equipped.

17. Connect the heater hoses.

18. Refill the radiator.

19. Connect the negative battery cable, run the vehicle until the thermostat opens, fill the radiator completely and check the operation of the heater.

20. Once the vehicle has cooled, recheck the coolant level.

Pick-Up and Ramcharger With Air Conditioning

1. Disconnect the negative battery cable. Properly discharge the air condition system. Drain the cooling system. Disconnect and plug the heater hoses and the refrigerant lines.

2. Remove the condensation tube from the housing.

3. Move the transfer case and gear shift levers away from the instrument panel, if equipped.

4. Remove the right side cowl trim panel, if equipped. Remove the glove box and swing it out from the bottom.

5. Remove the structural brace from the through hole in the glove box opening. Remove the ash tray.

6. Remove the right lower half of the dash reinforcement by removing the retaining screws holding it to the instrument panel and to the cowl side trim panel.

7. Disconnect the radio ground strap, if equipped. Remove the center and floor air distribution ducts.

8. Disconnect the temperature control cable from the assembly and tape it out of the way.

9. Disconnect the vacuum lines from the extension on the control unit and unclip the vacuum lines from the defroster duct.

10. Remove the wiring connector from the resistor block. Remove the blower motor electrical connector from the engine side of the assembly.

11. Disconnect the vacuum lines on the engine side and make sure the grommet is free from the dash panel.

12. Remove the retaining nuts on the engine side. Remove the screw that retains the assembly to the cowl side of the sheetmetal.

13. Remove the assembly from the vehicle.

14. Remove the vacuum actuators, door crank levers, evaporator case cover retaining nuts and screws and the heater core retaining screws. Lift the cover off of the assembly and remove the heater core from its mounting.

To install:

15. Clean the inside of the housing. Install the heater core into the housing.

16. Install the housing cover, retaining screws and nuts, levers and actuators.

17. Inspect the dash panel seals for damage and repair as required.

18. Feed the vacuum lines through the hole in the dash panel, install the assembly to the dash panel and install all retaining nuts and screws.

19. Connect the resistor block and blower motor.

20. Connect the vacuum lines to the extension on the control unit and clip the vacuum lines to the defroster duct.

21. Connect the temperature control cable to the assembly.

22. Connect the radio ground strap, if equipped. Install the center and floor air distribution ducts.

23. Install the dash reinforcement, structural brace, glove box and right side cowl trim panel, if equipped. Install the ash tray.

24. Install the condensation tube.

25. Connect the heater hoses and vacuum lines.

26. Install a new gasket and connect the refrigerant lines.

27. Evacuate and recharge the air conditioning system. Refill the radiator.

28. Connect the negative battery cable, run the vehicle until the thermostat opens, fill the radiator completely and check the operation of the entire climate control system.

29. Once the vehicle has cooled, recheck the coolant level.

Water Pump

REMOVAL & INSTALLATION

CAUTION

If the water pump is being replaced due to bearing or shaft damage, the mechanical cooling fan should be carefully inspected for fatigue cracks, loose blades or loose rivets resulting from excessive vibration. If the fan is damaged in any way, it could snap at any time, possibly causing serious personal injury or damage to the vehicle.

3.7L Engine

1. Disconnect the negative battery cable.

2. Drain the coolant and remove the lower radiator hose. Remove the shroud and radiator if necessary.

3. Remove the fan, spacer, pulley and bolts together.

NOTE: Do not place the viscous fan in an upright position because the silicone fluid in the drive could drain into the bearing and contaminate its lubricant.

4. Loosen the alternator, power steering pump or idler pulley and remove all belts. Remove the air pump and bracket, if equipped.

5. Position the bypass hose clamp in the center of the hose.

6. Disconnect the heater hose.

7. Remove the water pump retaining bolts and remove the pump from the engine.

To install:

8. Clean and dry the pump mating surfaces. Install a new bypass hose.

9. Install a new gasket and install the water pump. Install any bolts that do not attach a bracket. Tighten the bypass hose clamps. Install the heater hose.

10. Install the air pump and bracket, power steering pump and bracket and alternator. Torque all water pump bolts to 30 ft. lbs. (41 Nm).

11. Install the fan, spacer, pulley and bolts together.

12. Adjust all belt tensions.

13. Install the shroud and radiator, if they were removed. Fill the radiator with coolant.

14. Connect the negative battery cable, run the vehicle until the thermostat opens, fill the radiator completely and check for leaks.

15. Once the vehicle has cooled, recheck the coolant level.

3.9L, 5.2L and 5.9L Gasoline Engines

1. Disconnect the negative battery cable. Drain the coolant.

2. Remove the shroud from the radiator and slide it over the fan if it is 1-piece.

3. Remove the radiator and lower hose.

4. Remove the fan blade, spacer or viscous drive unit, pulley, bolts and shroud (if it was not removed in Step 2) together. Remove the air pump belt and power steering pump belt.

NOTE: Do not place the viscous fan in an upright position because the silicone fluid in the drive could drain into the bearing and contaminate its lubricant.

5. Loosen the alternator mounting bolts and remove the alternator/air conditioner belts.

6. Remove the alternator bracket.

Evaporator heater assembly—Pick-Up and Ramcharger with air conditioning

On some 1988–90 vehicles, this bracket also supports the air conditioner compressor or idler pulley, which will remain supported by its rear mount.

7. Remove the air pump(s). Remove the air pump bracket and unbolt the power steering pump bracket with the pump still attached and position it out of the way.

8. Disconnect the heater and bypass hoses.

9. On 1986–88 vehicles with air conditioning, remove the air conditioner compressor pulley and field coil assembly, if necessary to remove the water pump to compressor front mount bolts and bracket.

10. Remove the remaining pump retaining bolts (if any) and remove the pump from the engine.

To install:

11. Clean and dry the pump mating surfaces. Install a new bypass hose to the engine.

12. Install a new gasket and install the water pump to the engine.

13. Install any bolts that do not retain a bracket. Tighten the bypass hose clamps. Install the heater hose.

14. Install the water pump to compressor front mount bolts and bracket, if it was removed.

15. Install all remaining brackets and components that were removed during the removal procedure. Torque all water pump retaining bolts that do not go through adjusting slots to 30 ft. lbs. (41 Nm).

16. Install the air conditioner compressor pulley and field coil assembly, if it was removed. Install and adjust the alternator/air conditioner belts. Place the remaining belts over their components.

17. Install the fan blade, spacer or viscous drive unit, pulley and bolts along with the shroud (if it is a 1-piece unit) together.

18. Install the radiator, lower hose and shroud.

19. Adjust all belts and torque the remaining water pump retaining bolts to 30 ft. lbs. (41 Nm).

20. Fill the radiator with coolant.
21. Connect the negative battery cable, run the vehicle until the thermostat opens, fill the radiator completely and check for leaks.
22. Once the vehicle has cooled, re-check the coolant level.

5.9L Diesel Engine

1. Disconnect the negative battery cable.
2. Drain the coolant.
3. Use a $\frac{3}{8}$ in. drive breaker bar to lift the belt tensioner and remove the belt.

4. Remove the 2 water pump retaining bolts and remove the pump from the engine.

5. Remove the O-ring from the pump groove.

To install:

6. Clean the O-ring groove and install a new O-ring.

7. Clean the pump mating surfaces and install the pump to the engine.

8. Torque the mounting bolts to 18 ft. lbs. (24 Nm). Fill the radiator with coolant.

9. Install the drive belt.

10. Connect the negative battery cable, run the vehicle until the thermostat opens, fill the radiator completely and check for leaks.

11. Once the vehicle has cooled, re-check the coolant level.

5.9L diesel engine water pump

5.9L diesel engine thermostat

Thermostat

REMOVAL & INSTALLATION

Except 5.9L Diesel Engine

1. Disconnect the negative battery cable. Drain the coolant down to thermostat level or below.

2. Remove the thermostat housing.

3. Remove the thermostat and discard the gasket.

4. Clean the housing mating surfaces and use a new gasket.

5. The installation is the reversal of the removal procedure.

6. Connect the negative battery cable, run the vehicle until the thermostat opens, fill the radiator completely and check for leaks.

7. Once the vehicle has cooled, re-check the coolant level.

5.9L Diesel Engine

1. Disconnect the negative battery cable.

2. Drain the coolant.

3. Use a $\frac{3}{8}$ in. drive breaker bar to lift the belt tensioner and remove the belt.

4. Disconnect the upper radiator hose from the thermostat housing.

Installing the thermostat in the housing

Proper positioning of the rubber seal

1 CHRYSLER FULL SIZE PICK-UP • RAMCHARGER • VAN

5. Loosen the alternator mounting bolts and lower the alternator.

6. Unbolt the thermostat housing and remove the housing, engine lifting bracket and thermostat with seal.

To install:

7. Install the new thermostat to the housing, making sure the tang on the thermostat is aligned with the slot in the housing. This will ensure correct positioning of the jiggle pins in the housing. This is important because during filling, air vents through the jiggle pin openings through the upper hose and out the radiator fill neck.

8. Clean the pump mating surfaces.

9. Install the engine lifting bracket, new seal, thermostat and housing. Make sure the seal is installed with the beveled side facing out.

10. Torque the thermostat housing bolts to 18 ft. lbs. (24 Nm). Connect the upper hose to the housing.

11. Reinstall the alternator into position. Torque the upper bolt to 18 ft. lbs. (24 Nm) and the lower bolt to 32 ft. lbs. (43 Nm).

12. Install the drive belt.

13. Connect the negative battery cable, run the vehicle until the thermostat opens, fill the radiator completely and check for leaks.

14. Once the vehicle has cooled, recheck the coolant level.

Injector wiring connector location

Fuel filter location

GASOLINE FUEL SYSTEM

Fuel System Service Precautions

RELIEVING FUEL SYSTEM PRESSURE

1. Loosen the fuel filler cap to release fuel tank pressure.

2. Disconnect the injectors wiring harness from the engine harness.

3. Connect a jumper wire from either of the end pins in the connector to ground.

4. Being careful not to allow contact between the jumper leads, connect a jumper wire to the pin next to the one that is grounded and touch the other end of the jumper to the positive battery post for no longer than 5 seconds. This will relieve fuel pressure.

5. Remove the jumper wires and connect the connector.

Fuel Filter

REMOVAL & INSTALLATION

Carbureted Engine

1. Disconnect the negative battery cable.

2. Raise the vehicle and support safely.

3. Remove the fuel filter with hoses.

NOTE: Some vehicles may be equipped with a field package designed to combat driveability problems associated with fuel foaming. Affected vehicles have a special replaceable filter/reservoir mounted inboard on the right front frame rail. When the kit is installed, the conventional filter is discarded. Do not install a conventional filter or conventional clamps or hoses in place of the special replacement parts; they are not compatible with the electronic fuel pump installed with the kit.

4. Install the new filter, hoses and clamps.

5. If the vehicle is equipped with a Rochester Quadrajet carburetor, a second filter mounted in the carburetor can also be replaced. Remove the air cleaner assembly, disconnect the fuel line, remove the fuel inlet nut, gasket, filter and spring. The installation is the reversal of the removal procedure.

6. Connect the negative battery cable, start the engine and check for leaks.

Fuel Injected Engine

CAUTION

Do not use conventional fuel hoses or clamps when servicing this fuel system. They are not compatible with the injection system and could fail, causing personal injury or damage to the vehicle. Use only hos-

es and clamps specifically designed for fuel injection.

1. Relieve the fuel pressure.
2. Disconnect the negative battery cable.
3. Remove the filter retaining screw and remove the filter assembly from the mounting plate.
4. Loosen the outlet hose clamp on the filter and inlet hose clamp on the rear fuel tube.
5. Wrap a shop towel around the hoses to absorb fuel. Remove the hoses from the filter and fuel tube and discard the clamps and the filter.

To install:

6. Install the inlet hose on the fuel tube and tighten the new clamp to 10 inch lbs. (1 Nm).
7. Install the outlet hose on the filter outlet fitting and tighten the new clamp to 10 inch lbs. (1 Nm).
8. Position the filter assembly on the mounting plate and tighten the mounting screw to 75 inch lbs. (8 Nm).
9. Connect the negative battery cable, start the engine and check for leaks.

Mechanical Fuel Pump

PRESSURE TESTING

1. Raise the vehicle and support safely.
2. Connect a pressure gauge (0–15 psi minimum range) to the fuel pump outlet fitting.
3. Crank the engine several times while observing the gauge.
4. The 3.7L engine should develop 4.0–5.5 psi. The 5.2L and 5.9L engines should develop 5.75–7.25 psi. If the vehicle is equipped with the field package noted above, fuel pressure should be 13–15 psi.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Raise the vehicle and support safely.
3. Disconnect the fuel lines from the pump and plug them.
4. Remove the fuel pump retaining bolts and remove the pump from the engine.
5. Clean and dry the mounting surfaces and bolt holes.
6. The installation is the reversal of the removal procedure.
7. Connect the negative battery cable, start the engine and check for leaks.

Electric Fuel Pump

PRESSURE TESTING

1. Relieve the fuel pressure.
2. Disconnect the larger diameter fuel supply hose from the engine fuel line assembly.
3. Connect the fuel system pressure tester C-4799A, or equivalent between the fuel supply hose and the engine fuel line assembly.
4. With the key in the **RUN** position, put the DRB I or II in the activate auto shutdown relay mode; this will activate the fuel pump and pressurize the system.
5. The pressure specification is 13.5–15.5 psi. If the pressure is within specifications, reinstall the fuel hose.
6. If fuel pressure is below specifications, install the tester in the fuel supply line between the tank and the filter and repeat the test.
7. If the pressure is 5 psi higher than in Step 5, replace the fuel filter. If no change is observed, squeeze the return hose. If pressure increases, replace the pressure regulator. If no change is observed, the problem is either a plugged in-tank sock filter or a defective pump.
8. If fuel pressure is above specifications, remove the fuel return line hose from the chassis line at the fuel tank and connect a 3 foot piece of fuel hose to the return line. Put the other end into a 2 gallon minimum capacity approved gasoline container. Repeat the test. If pressure is now correct, check the in-tank return hose for kinking. Replace the fuel pump assembly if the in-tank reservoir check valve or aspirator jet is obstructed.
9. If pressure is still above specifications, remove the fuel return hose from the throttle body. Connect a substitute hose to the throttle body return nipple and place the other end of the hose in a clean container. Repeat the test. If pressure is now correct, check for a restricted fuel return line. If no change is observed, replace the fuel pressure regulator.

REMOVAL & INSTALLATION

The fuel pump module is installed in the top of the fuel tank. It contains the fuel pump, fuel pump reservoir, pressure relief/rollover valve, electrical connector for the sending unit, fuel filler vent, supply and return tube connections and the drain tube nipple.

1. Relieve the fuel pressure.
2. Disconnect the negative battery cable.
3. Raise the vehicle and support safely. Remove the skid plate, if equipped.
4. Using the proper equipment, drain the fuel tank.
5. Disconnect the vent hoses and filler hose from the tank and remove

the hoses from the bracket attached to the top of the frame rail, if equipped.

6. Place a transmission jack or equivalent under the center of the tank and apply slight pressure.
7. Remove the retaining strap J-bolt nuts and remove the straps.
8. Lower the tank enough to reach in and disconnect the electrical connector and the remaining fuel tubes from the top of the module.
9. Lower the tank and remove the module. When the module is released from the tank it will spring up. Remove the pump from the module.

To install:

10. Clean the seal area of the tank. Install the new pump to the module so the filter is in the same position as before removal. Install a new O-ring on the module.
11. Align the module with the retaining bracket on the bottom of the tank. It is normal for the module to have a slight interference fit with the bracket.
12. Push the module down and install the retaining clamp.
13. Install the fuel tank and skid plate, if equipped.
14. Connect the negative battery cable, start the engine and check for leaks.

Carburetor

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the air cleaner assembly.
3. Remove and install the fuel tank cap to relieve any pressure in the tank.
4. Matchmark all vacuum hoses and electrical connectors and remove from the carburetor.
5. Disconnect the throttle, cruise control, choke and kickdown cables and linkages, if equipped.
6. Disconnect and plug the fuel inlet line.
7. Remove the mounting bolts and/or nuts and remove the carburetor from the intake manifold.

Remove the carburetor from the intake manifold.

To install:

8. Clean the mounting surface of the manifold and install a new base gasket.
9. Install the mounting bolts and/or nuts and tighten them alternately to compress the base gasket evenly.
10. Connect the fuel line.
11. Connect the throttle, cruise control, choke and kickdown cables and linkages, if equipped.
12. Install all vacuum hoses and electrical connectors in their proper locations.
13. Install the air cleaner.

1 CHRYSLER FULL SIZE PICK-UP • RAMCHARGER • VAN

14. Connect the negative battery cable, start the engine and perform all necessary adjustments.

IDLE SPEED ADJUSTMENT

1. Start the engine and run until at normal operating temperature. Check and adjust the ignition timing. Turn the engine off.

2. Disconnect and plug the EGR hose. Disconnect the oxygen sensor, if equipped.

3. Disconnect and plug the $\frac{3}{16}$ in. hose at the canister.

4. Remove the PCV hose from the valve cover and allow it to draw underhood air.

5. Ground the carburetor switch with a jumper wire, if equipped.

6. Disconnect the vacuum hose from the computer, if equipped and connect an auxiliary vacuum supply of 16 Hg.in.

7. Make sure all accessories are off. Install a tachometer and start the engine.

8. Allow the engine to run for 2 minutes to stabilize. Turn the idle speed screw until the correct idle speed according to the VECI label is reached.

9. Connect all wires and hoses that were previously disconnected. It is normal for the idle speed to vary after all hoses and wires are reconnected; do not readjust.

IDLE MIXTURE ADJUSTMENT

1. Disconnect and plug the EGR hose. Disconnect the oxygen sensor, if equipped.

2. Disconnect and plug the $\frac{3}{16}$ in. hose at the canister.

3. Remove the PCV hose from the valve cover and allow it to draw underhood air.

4. Ground the carburetor switch with a jumper wire, if equipped.

5. Disconnect the vacuum hose from the computer, if equipped and connect an auxiliary vacuum supply of 16 Hg.in.

6. Remove the concealment plug. Disconnect the vacuum supply hose to the tee and install a propane supply hose in its place.

7. Make sure all accessories are off. Install a tachometer and start the engine. Allow the engine to run for 2 minutes to stabilize.

8. Open the main propane valve. Slowly open the propane metering valve until the maximum engine rpm is reached. When too much propane is added, the engine will begin to stumble; at this point back off until the engine stabilizes.

Adjusting the idle speed

9. Adjust the idle rpm to obtain the specified propane rpm. Fine tune the metering valve to obtain the highest rpm again. If there has been a change to the maximum rpm, readjust the idle screw to the specified propane rpm.

10. Turn the main propane valve off and allow the engine to run for 1 minute to stabilize.

11. Adjust the mixture screw to obtain the smoothest idle at the specified idle rpm.

12. Open the main propane valve. Fine tune the metering valve to obtain the highest rpm. If the maximum engine speed is more than 25 rpm different than the specified propane rpm, repeat the procedure.

13. Turn the propane valves off and remove the propane canister. Reinstall the vacuum supply hose to the tee.

14. Perform the idle speed adjustment procedure.

15. Connect all wires and hoses that were previously disconnected.

3. Disconnect the ISC actuator connector and the coolant temperature sensor.

4. Connect a tachometer to the engine and start the engine.

5. Adjust the extension screw on the actuator shaft until the rpm is within specifications:

3.9L engine—2500–2600 rpm

5.2L and 5.9L engines—2750–2850 rpm

6. Turn the engine off. Reconnect the ISC actuator connector and the coolant temperature sensor. Remove the tachometer.

IDLE MIXTURE ADJUSTMENT

There is no idle mixture adjustment provided with this fuel injection system.

Fuel Injector

REMOVAL & INSTALLATION

1. Remove the air cleaner assembly.
2. Relieve the fuel pressure.
3. Disconnect the negative battery cable.

NOTE: There is a small spacer below the injector hold-down clamp. Take the proper precaution to prevent this spacer from falling into the throttle body.

4. Remove the injector hold-down Torx® screw, the hold-down and the spacer.

5. Using a small flat-tipped tool, lift the caps off of the injector.

6. Using the same tool, gently pry the injector from its pod.

SERVICE ADJUSTMENTS

For all carburetor service adjustment procedures and Specifications, please refer to "Carburetor Service" in the Unit Repair section.

Fuel Injection

IDLE SPEED ADJUSTMENT

1. Start the engine and allow it to reach normal operating temperature. If it is already hot, run it for 2 minutes.

2. Turn the engine off and allow 1 minute for the Idle Speed Control (ISC) actuator shaft to fully extend.

7. Remove the lower O-ring from the pod.

To install:

8. Install the new lower O-ring on the injector.

9. Align the injector terminal housing with the locating socket in the injector cap.

10. Press the injector cap so that the upper O-ring flange is flush with the lower surface of the cap.

11. Spray the inner surfaces of the injector pod with suitable carburetor parts cleaner to remove residual varnish and gasoline.

12. Lubricate the O-rings sparingly with unmedicated petroleum jelly.

13. Place the injector and cap into the injector pod and align the cap locating pin with the locating hole in the casting. The right side locating pin in 5mm in diameter and will not fit into the other hole. The left side pin is 4mm in diameter and will be loose in the other hole.

14. Press firmly on the injector cap until it is flush with the casting surface.

15. Install the spacer and align the holes in the hold-down with the pins on the caps and install.

16. Push down on the caps, install the screw and torque to 35 inch lbs. (4 Nm).

17. Connect the negative battery cable and check for leaks using the DRB I or II to activate the fuel pump.

18. Install the air cleaner.

Injector hold-down and spacer

Removing the Injector from its pod

DIESEL FUEL SYSTEM

Fuel/Water Separator Filter

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Disconnect the Water In Filter (WIF) sensor connector.

3. Remove the separator filter assembly from the filter head with a standard oil filter wrench.

4. Remove the square cut O-ring from the filter mounting bushing.

5. Drain the fuel/water separator filter and remove the assembly from the fuel filter.

To install:

6. Install a new O-ring to the WIF assembly and install to the new separator filter.

7. Install a new square cut O-ring to

Installing the Injector to the cap

the mounting bushing.

8. Fill the fuel/water separator filter with clean diesel fuel.

9. Apply a light coat of oil to the sealing surface of the separator filter.

10. Install the assembly and tighten it ½ turn after the seal contacts the filter head.

11. Reconnect the WIF sensor connector.

12. Connect the negative battery cable, start the engine and check for leaks.

DRAINING WATER FROM THE SYSTEM

Filtration and separation of water from the fuel is important for trouble free operation and long life of the fuel system. Regular maintenance, including draining moisture from the fuel/water separator filter is essential to keep water out of the fuel pump. To remove the collected water, simply unscrew the drain at the bottom of the WIF assembly located at the bottom of the filter separator.

Diesel Injection Pump REMOVAL & INSTALLATION

NOTE: The Bosche VE lever is indexed to the shaft during pump calibration. Do not remove it from the pump during removal.

1. Disconnect the negative battery cable.

2. Remove the throttle linkage and bracket.

3. Disconnect the fuel drain manifold.

4. Remove the injection pump supply line.

5. Remove the high pressure lines.

6. Disconnect the electrical wire to the fuel shut off valve.

7. Remove the fuel air control tube.

8. Remove the pump support bracket.

9. Remove the oil fill tube bracket and adapter from the front gear cover.

10. Place a shop towel in the gear cover opening in a position that will prevent the nut and washer from falling into the gear housing. Remove the gear retaining nut and washer.

11. Install the turning tool into the flywheel housing opening on the exhaust side of the engine. Place a ½ in.

drive universal joint in the turning tool and attach enough extensions to the joint to make it convenient to turn the tool.

12. Using a ratchet to turn the turning tool, turn the engine until the key way on the fuel pump shaft is pointing approximately in the six o'clock position.

13. Locate TDC for cylinder No. 1 by turning the engine slowly while pushing in on the TDC pin. Stop turning the engine as soon as the pin engages with the gear timing hole. Disengage the pin after locating TDC and remove the turning equipment.

14. Loosen the lock screw, remove the special washer from the injection pump and wire it to the line above it so it will not get misplaced. Retighten the lock screw to 22 ft. lbs. (30 Nm) to lock the driveshaft.

15. Using a suitable puller, pull the pump drive gear from the driveshaft.

NOTE: Be careful not to drop the drive gear key into the front cover when removing or installing the pump. If it does drop in, it must be removed before proceeding.

Fuel system components—5.9L diesel engine

Installing the turning tool

Locating TDC with the TDC pin

Removing the special washer from the injection pump

16. Remove the 3 mounting nuts and remove the injection pump from the vehicle.

17. Remove the gasket and clean the mounting surface.

To install:

18. Install a new gasket.

NOTE: The shaft of a new or re-conditioned pump is locked so the

key aligns with the drive gear keyway with cylinder No. 1 at TDC.

19. Install the pump and finger tighten the mounting nuts; the pump must be free to move in the slots.

20. Install the pump drive gear, washer and nut to the driveshaft. The pump will rotate slightly because of gear helix and clearance. This is ac-

ceptable providing the pump is free to move on the flange slots and the crankshaft does not move. Torque the nut to 11-15 ft. lbs. (15-20 Nm). This is not the final torque; do not overtighten.

21. If installing the original pump, rotate the pump to align the original timing marks and torque the mounting nuts to 18 ft. lbs. (24 Nm).

22. If installing a replacement pump, take up gear lash by rotating the pump counterclockwise toward the cylinder head, and torque the mounting nuts to 18 ft. lbs. (24 Nm). Permanently mark the new injection pump flange to match the mark on the gear housing.

23. Loosen the lock screw and install the special washer under the lock screw. Torque to 19 ft. lbs. (13 Nm). Disengage the TDC pin.

24. Install the injection pump support bracket. Finger tighten the bolts initially, then torque them to 18 ft. lbs. (24 Nm) in the following sequence

a. Bracket to block bolts.

b. Bracket to injection pump bolts.

c. Throttle support bracket bolts

25. Now perform the final torque of the pump drive gear retaining nut to 48 ft. lbs. (65 Nm).

26. Install the oil filler tube assembly and clamp. Torque the bolts to 32 ft. lbs. (43 Nm).

27. Install all fuel lines and the electrical connector to the fuel shut off valve. Tighten the high pressure lines to 18 ft. lbs. (24 Nm).

28. Install the fuel air control tube. Torque the banjo fitting bolt to 9 ft. lbs. (12 Nm).

29. Install the throttle bracket and linkage. When connecting the cable to the control lever, adjust the length so the lever has stop-to-stop movement.

30. Connect the negative battery cable.

CAUTION

Do not place any part of the hand near the base of the high pressure line. A fuel leak from a high pressure fuel line has sufficient pressure to penetrate the skin and cause serious bodily harm. Do not bleed the lines if the engine is hot. Fuel spilling onto a hot exhaust manifold creates the danger of fire.

31. To bleed air from the system, run or crank the engine and carefully loosen the high pressure fitting from each injector one at a time. Retighten the fitting after the air has expelled before going on to the next injector fitting. The operation is complete when the engine runs smoothly. If the air cannot be removed, check the pump and supply line for suction leaks.

32. Adjust the idle speed if necessary.

IDLE SPEED ADJUSTMENT

1. Start the engine and run until at normal operating temperature.
2. An optical tachometer must be used to read engine speed; a conventional tachometer connected to the coil is useless in this instance.
3. Turn the air conditioning ON, if equipped.
4. Turn the idle speed screw until the desired idle speed is obtained. The specification for a vehicle equipped with automatic transmission is 700 rpm. The specification for a vehicle equipped with manual transmission is 750 rpm.

Adjusting the idle speed screw

Injection Pump Timing

ADJUSTMENT

1. Install the turning tool into the flywheel housing opening on the exhaust side of the engine. Place a ½ in. drive universal joint in the turning tool and attach enough extensions to the joint to make it convenient to turn the tool.
2. Using a ratchet to turn the turning tool, turn the engine until the key way on the fuel pump shaft is pointing approximately in the six o'clock position.
3. Locate TDC for cylinder No. 1 by turning the engine slowly while pushing in on the TDC pin. Stop turning the engine as soon as the pin engages with the gear timing hole. Disengage the pin after locating TDC.
4. Remove the plug from the end of the pump.
5. Install the special timing indicator, allowing for adequate indicator pin travel. It may be necessary to disconnect 1 or more fuel lines to properly install the indicator.

NOTE: The indicator is marked in increments of 0.01mm. One revolution of the indicator needle is equal to 0.050mm.

6. Turn the engine counterclockwise until the indicator needle stops moving. Adjust the indicator face to read zero.

7. Rotate the engine back to TDC and count the number of revolutions of the indicator needle. The reading shown when the engine timing pin engages is the amount of plunger lift the pump has at that point.

8. Readjust the indicator face to read zero. Loosen the pump mounting nuts and rotate the pump clockwise toward the cylinder head until the indicator reads the correct value for plunger lift (the reading in Step 7). Torque the mounting nuts to 18 ft. lbs. (24 Nm).

Removing the plug from the pump

Installing the timing indicator

1 Rotation

0.50 mm

9. Remove the engine turning equipment and timing indicator. Install the timing plug and torque to 7.5 ft. lbs. (10 Nm). Connect any fuel lines that were disconnected.

10. Road test the vehicle.

Fuel Injector

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Remove the throttle linkage and bracket if necessary.

2. Disconnect the high pressure fuel supply line to the injector.

3. Disconnect the fuel drain manifold.

4. Clean the area around the injector.

5. Using a 24mm deepwell socket,

remove the injector from the cylinder head.

To install:

6. Clean the injector bore with a bore brush.

7. Assemble the injector and 1 new copper sealing washer. Never use more than 1 copper washer.

8. Apply a thin coat of anti-sieze compound to the threads of the injector hold-down nut and between the top of the nut and the injector body.

9. Align the protrusion in the injector with the notch in the bore and install the injector. Torque the injector retainer nut to 44 ft. lbs. (60 Nm).

10. Push the O-ring into the groove at the top of the injector.

11. Using new sealing washers, assemble the fuel drain manifold and high pressure lines. Torque the banjo fitting bolt to 6 ft. lbs. (8 Nm). Leave the high pressure line loose temporarily.

CAUTION

Do not place any part of the hand near the base of the high pressure line. A fuel leak from a high pressure fuel line has sufficient pressure to penetrate the skin and cause serious bodily harm. Do not bleed the lines if the engine is hot. Fuel spilling onto a hot exhaust manifold creates the danger of fire.

12. To bleed air from the system, run or crank the engine and tighten the fitting after the air has expelled. If more than 1 injector was replaced, tighten each fitting after the air has expelled before going on to the next injector fitting. Torque the fittings to 18 ft. lbs. (24 Nm). The operation is complete when the engine runs smoothly. If the air cannot be removed, check the pump and supply line for suction leaks.

13. Install the throttle linkage and bracket if they were removed.

EMISSION CONTROLS

Please refer to "Emission Control" in the Unit Repair section for system maintenance procedures. Due to the complex nature of modern electronic engine control systems, comprehensive diagnosis and testing procedures fall outside the confines of this repair manual. For complete information on diagnosis, testing and repair procedures concerning all modern engine and emission control systems, please refer to "Chilton's Guide to Electronic Engine Controls".

Emissions Warning Lamp

RESETTING

1986-88 Vehicles

1. Locate the EMR switch module. It is a red, green or tan plastic box located either on the lower portion of the steering column or to the left of the steering column on Vans and behind the right side of the glove box on Pick-Up and Ramcharger.

2. Remove the 9 volt battery (under the small black panel) from the module. 1988 vehicles do not have the 9 volt battery.

3. Reset the switch by inserting a small rod into a hole in the case of the module, which closes a switch and turns the lamp off.

4. Install a new 9 volt battery, if equipped.

1989-90 Vehicles

1. Connect the DRBII to the diagnostic connector.

2. Turn the ignition switch to the RUN position and access the Emissions EMR Tests on the DRBII.

3. Select EMR Memory Check.

4. Select Reset EMR Light. This will reset the EMR timing in the computer and turn the light off.

5. Disconnect the DRBII.

GASOLINE ENGINE MECHANICAL

NOTE: Disconnecting the negative battery cable on some vehicles may interfere with the functions of the on board computer systems and may require the computer to undergo a relearning process, once the negative battery cable is reconnected.

Engine

REMOVAL & INSTALLATION

1. Relieve the fuel pressure if the vehicle is equipped with fuel injection. Disconnect the negative battery cable from the battery and from the engine.

2. Remove the hood and the oil dipstick. Discharge the air conditioning on Vans. It is not necessary to discharge the air conditioning on Pick-Up or Ramcharger.

3. Raise the vehicle and support safely. Drain the engine oil and coolant. Remove the lower radiator hose.

4. Remove the starter. Remove the engine to transmission struts, if equipped.

5. Remove the air pump tube from the exhaust pipe on 3.7L engine. Remove the exhaust pipe from the exhaust manifold(s).

6. If the vehicle is equipped with a manual transmission, remove the transmission and all related parts.

7. If the vehicle is equipped with an automatic transmission, remove the inspection plate, matchmark the flex plate to the converter, remove the torque converter bolts and push the torque converter backwards as far as it will go. Remove the lower bell housing bolts.

8. Remove the engine mount lower nuts. Remove only the right side mount insulator nut on 3.7L engine.

9. Disconnect and plug the rubber fuel inlet and return hoses from the fuel lines at the right front of the vehi-

Installing the fuel injector

cle. Lower the vehicle.

10. Remove the air cleaner assembly, disconnect all linkages and cables and remove the carburetor or throttle body. Stuff a clean shop towel into the intake manifold opening to prevent foreign objects from entering. Remove the left exhaust manifold and heat shield on Vans.

11. Remove the discharge and suction lines from the compressor on Vans. Cap the openings on the compressor to prevent foreign objects from entering. Unbolt the compressor from the engine on Pick-Up and Ramcharger and position it to the side.

12. On Vans, remove the front bumper, grille and support brace. Remove the radiator, shroud, condenser and support as an assembly. On Pick-Up and Ramcharger, remove the radiator and shroud. Remove the fan and all related parts.

13. Unbolt the power steering pump brackets from the engine and position it to the side.

14. Remove the alternator, air pump and all brackets. Disconnect the heater hoses.

15. Remove the distributor cap with all spark plug wires attached.

16. Disconnect all remaining electrical connectors, vacuum hoses and check for any other items preventing engine removal.

17. Attach an engine removal device to the intake manifold or cylinder head.

18. If the vehicle is equipped with an automatic transmission, support the transmission with a floor jack, or equivalent. Remove the remaining bell housing bolts. Remove the upper left engine mount nut on 3.7L engine.

19. Remove the engine from the vehicle slowly and carefully. Vans may need to be raised slightly, depending on the size of the removal device.

To install:

20. Lower the engine into position and install the upper bell housing bolts. Install the left side engine mount nut on 3.7L engine. Remove the engine removal device. Install the left side exhaust manifold, if it was removed. Install the oil dipstick.

21. Raise the vehicle and support safely.

22. Install the engine mount nuts and the remaining bell housing bolts.

23. If the vehicle is equipped with a manual transmission, install the transmission and all related parts.

24. If the vehicle is equipped with an automatic transmission, align the torque converter and flex plate and install the bolts. Install the inspection plate, starter and the engine to transmission struts, if equipped.

25. Connect the rubber fuel inlet and return hoses to the fuel lines at the

right front of the vehicle.

26. Install the exhaust pipe to the exhaust manifold(s). Install the air pump tube to the exhaust pipe on 3.7L engine. Lower the vehicle.

27. Connect the heater hoses.

28. Make sure the negative battery cable is not connected to the battery. Connect the engine side of the negative cable to the engine. Install the alternator, air pump, power steering pump and all brackets.

29. Install the air conditioning compressor and connect the lines with new gaskets, if they were disconnected.

30. Install the throttle body or carburetor using a new base gasket and connect all linkages and cables. Connect all electrical connectors, vacuum hoses, etc. that were disconnected during the engine removal procedure.

31. Install the lower radiator hose. Install the fan and all related parts. Adjust all belt tensions.

32. On Vans, install the radiator, shroud, condenser and support as an assembly. Install the support brace, grille and bumper. On Pick-Up and Ramcharger, install the radiator and shroud.

33. Install the distributor cap with all spark plug wires attached.

34. Install the air cleaner assembly.

35. Install the hood.

36. Fill the engine with the specified amount of oil and fill the radiator with coolant.

37. Connect the negative battery cable and set all adjustments to specification.

38. Evacuate and recharge the air conditioning system if it was opened.

Cylinder Head

REMOVAL & INSTALLATION

Cylinder head bolt torque sequence—3.7L engine

3.7L Engine

1. Disconnect the negative battery cable and drain the cooling system.

2. Remove the air cleaner assembly and fuel line.

3. Disconnect all wires, hoses, linkages and cables from the carburetor.

4. Disconnect the vacuum line from the distributor.

5. Disconnect the ignition wires from all 6 spark plugs.

6. Disconnect the heater hose and the upper clamp around the bypass hose.

7. Disconnect the coolant temperature sending unit wire.

8. Disconnect the exhaust pipe from the manifold.

9. Disconnect the diverter valve vacuum line from the intake manifold and remove the air tube assembly from the cylinder head, if equipped.

10. Remove the PCV hose from the valve cover and remove the valve cover.

11. Note the positioning of the oil hole and remove the rocker arms and shaft assembly. Do not disassemble unless service is required.

12. Remove the pushrods and identify them to ensure installation in their original locations.

13. Remove the head bolts and remove the cylinder head with the manifolds as an assembly. Remove the manifolds from the head.

To install:

14. Clean and dry all gasket surfaces of the cylinder block and head. Inspect all surfaces with a straightedge. If the flatness exceeds 0.0075 times the length of the span measured (in any direction), replace or machine the head gasket surface.

15. Using no sealer whatsoever, install a new head gasket to the block.

Clean, dry and lightly oil all head bolt threads. Engaging the bypass hose, position the head assembly—without the manifolds—on the block and install the head bolts.

16. Torque the head bolts in sequence to 35 ft. lbs. (47 Nm). Repeat the sequence retightening the bolts to a final torque of 70 ft. lbs. (95 Nm).

17. Install the pushrods. Assemble the rocker shaft assembly, if it was serviced. Install the assembly with the oil hole positioned to provide proper lubrication to the rocker assemblies. Install the rocker shaft retainers between the rocker arms and not on the extended bushings of the arms; the long retainer belongs in the center position only. Install the special shaft bolt at the rear of the shaft and install the rest of the bolts to the shaft. Torque the bolts evenly and gradually to 25 ft. lbs. (34 Nm).

18. Clean and dry the valve cover mating surfaces, bolts and bolt holes. Install the valve cover with a new gasket. Install the PCV valve.

19. Install the manifolds to the head and snug all nuts to about 20 inch lbs. Make sure the conical washers are installed with the cup side in.

20. Tighten the inner nut holding the manifolds together to 300 inch lbs. (34 Nm), then torque the outer 2 bolts to 260 inch lbs. (31 Nm).

21. Starting at the center and working outward, torque the manifold nuts on the head to 120 inch lbs. (14 Nm). Do not overtorque these nuts.

22. Connect the heater hose and bypass hose clamps.

23. Connect the wires, hoses, linkages and cables to the carburetor. Connect the fuel line.

24. Connect the spark plug wires, the distributor vacuum line and the sending unit wire.

25. Install the air tube with a new gasket and install the diverter valve vacuum line, if equipped.

26. Connect the exhaust pipe to the manifold.

27. Install the air cleaner assembly.

28. Fill the cooling system.

29. Connect the negative battery cable and set all adjustments to specification.

3.9L, 5.2L and 5.9L Engines

1. Relieve the fuel pressure if the vehicle is equipped with fuel injection. Disconnect the negative battery cable from the battery and drain the cooling system.

2. Raise the vehicle and safely support. Disconnect the exhaust pipe from the manifolds.

3. Remove the alternator if the right head is being removed and the air pump and battery ground cable if

the left head is being removed.

4. Remove the air cleaner assembly. Remove the air conditioning compressor or unbolt it and lay it to the side, if equipped. Remove the distributor cap with all wires attached.

5. Disconnect all wires, hoses, linkages and cables from the carburetor or throttle body. Disconnect the fuel line.

6. Disconnect the ignition coil, coolant temperature sending unit wire and all other connectors along the wiring harness connected to items on the intake manifold.

7. Disconnect the heater hose, upper radiator hose and the lower bypass hose clamp.

8. Remove the valve cover(s).

9. Remove the intake manifold assembly. Remove the exhaust manifold(s).

10. Remove the rocker arm and shaft assembly from the head(s). Do not disassemble unless service is required.

11. Remove the pushrods and identify them to ensure installation in their original locations.

12. Remove the head bolts and remove the cylinder head(s).

To install:

13. Clean and dry all gasket surfaces of the cylinder block and head. Inspect all surfaces with a straightedge. If the flatness exceeds 0.0075 times the length of the span measured (in any direction), replace or machine the head

gasket surface.

14. Using no sealer whatsoever, install the new head gasket(s) to the block. Clean, dry and lightly oil all head bolts threads. Install the head(s) and install the head bolts.

15. Torque the head bolts in sequence to 50 ft. lbs. (68 Nm). Repeat the sequence retightening the bolts to a final torque of 105 ft. lbs. (143 Nm) and repeat the second step to ensure all bolts are accurately torqued.

16. Assemble the rocker shaft assembly, if it was serviced. Make sure all rocker arms with an RH stamped on them are installed to the right of those with an LH. Install the pushrods, rocker arms and shaft(s) with the notch on the end of the shaft pointing to the engine centerline and to the rear of the right bank or to the front of the left bank. Make sure the long stamped steel retainers are at the number 2 and 4 positions. Torque the bolts evenly and gradually to 200 inch lbs. (23 Nm).

17. Clean and dry the intake manifold contact surfaces. Coat the intake manifold side gaskets very lightly with sealer and install the gaskets to the heads. Cutouts at the front of the gaskets differentiate the right and left sides.

18. Apply a thin uniform coat of quick dry cement to the front and rear intake manifold gaskets and mounting surfaces on the block and apply a thin

Cylinder head bolt torque sequence—3.9L engine

Cylinder head bolt torque sequence—5.2L and 5.9L engines

bead of sealer to each of 4 the corners. Install the front and rear gaskets engaging the hole in the block and the tangs from the head gaskets. Apply a second thin bead of sealer above the gaskets in the 4 corners.

19. Carefully lower the intake manifold into position engaging the bypass hose; after it is satisfactorily in place, inspect the gaskets to make sure they have not become dislodged.

20. Install the intake manifold bolts and torque in sequence to 25 ft. lbs. (34 Nm). Repeat the sequence retightening the bolts to a final torque of 40 ft. lbs. (54 Nm) and repeat the second step to ensure all bolts are accurately torqued.

21. Install the exhaust manifold(s) and torque the bolts to 20 ft. lbs. (27 Nm). Torque the end nuts to 15 ft. lbs. (20 Nm).

22. Clean and dry the valve cover mating surfaces, bolts and bolt holes. Install the valve cover(s) each with a new gasket.

23. Connect the heater hose, upper radiator hose and the lower bypass hose clamp.

24. Connect the ignition coil, coolant temperature sending unit wire and all other connectors that were disconnected along the wiring harness.

25. Install the air conditioning compressor, if equipped. Install the distributor cap and all spark plug wires.

26. Install the alternator, battery ground and air pump, if they were removed.

27. Connect all wires, hoses, cables and the fuel line to the carburetor or throttle body. Install the air cleaner assembly.

28. Raise the vehicle and safely support. Connect the exhaust pipe to the manifolds.

29. Fill the cooling system.

30. Connect the negative battery cable and set all adjustments to specification.

Rocker Arms and Shaft

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the valve cover and gasket.

3. Note the positioning of the oil hole (3.7L engine) or notch (3.9L, 5.2L and 5.9L engines) and remove the rocker arms and shaft assembly from the head.

4. Disassemble the assembly as required and replace all worn parts.

NOTE: On engines with exhaust valve rotators, the exhaust

Rocker shaft assembly—3.7L engine

ROCKER ARM—"LEFT"

ROCKER ARM—"RIGHT"

Identifying and assembling the rocker assembly—5.2L and 5.9L engines; 3.9L engine parts are similar

rocker arm must have relief for clearance.

To install:

5. On 3.7L engine, install the assembly with the oil hole positioned to provide proper lubrication to the rocker assemblies. Install the rocker shaft retainers between the rocker arms and not on the extended bushings of the arms; the long retainer belongs in the center position only. Install the special shaft bolt at the rear of the shaft and

install the rest of the bolts to the shaft. Torque the bolts evenly and gradually to 25 ft. lbs. (34 Nm).

6. On 3.9L, 5.2L and 5.9L engines, make sure all rocker arms with an **RH** stamped on them are installed to the right of those with an **LH**. Install the assembly with the notch on the end of the shaft pointing to the engine centerline and to the rear of the right bank or to the front of the left bank. Make sure the long stamped steel re-

tainers are at the number 2 and 4 positions. Torque the bolts evenly and gradually to 200 inch lbs. (23 Nm).

7. Clean and dry the valve cover mating surfaces, bolts and bolt holes. Install the valve cover with a new gasket. Torque the screws or nuts to 95 inch lbs. (11 Nm).

8. Connect the negative battery cable and check for leaks.

Intake Manifold

REMOVAL & INSTALLATION

3.9L, 5.2L and 5.9L Engines

1. Relieve the fuel pressure if the vehicle is equipped with fuel injection. Disconnect the negative battery cable from the battery and drain the cooling system.

2. Remove the air pump and bracket. Removal of the bracket will allow for easier installation of the left front corner of the intake manifold.

3. Remove the air cleaner assembly. Remove the air conditioning compressor or unbolt it and lay it to the side, if equipped. Remove the distributor cap with all wires attached.

4. Disconnect all wires, hoses, linkages and cables from the carburetor or throttle body. Disconnect the fuel line.

5. Disconnect the ignition coil, coolant temperature sending unit wire and all other connectors along the wiring harness connected to items on the intake manifold.

6. Disconnect the heater hose, upper radiator hose and the lower bypass hose clamp.

7. Remove the valve covers.

8. Unbolt the intake manifold from the heads and remove the intake manifold assembly. Disassemble the manifold as required and clean out the exhaust crossover passages.

To install:

9. Clean and dry the intake manifold contact surfaces. Coat the intake manifold side gaskets very lightly with sealer and install the gaskets to the heads. Cutouts at the front of the gaskets differentiate the right and left sides.

10. Apply a thin uniform coat of quick dry cement to the front and rear intake manifold gaskets and mounting surfaces on the block and apply a thin bead of sealer to each of 4 the corners. Install the front and rear gaskets engaging the hole in the block and the tangs from the head gaskets. Apply a second thin bead of sealer above the gaskets in the 4 corners.

11. Carefully lower the intake manifold into position engaging the bypass hose; after it is satisfactorily in place, inspect the gaskets to make sure they have not become dislodged.

Intake manifold bolt torque sequence—3.9L engine

Intake manifold bolt torque sequence—5.2L and 5.9L engine

12. Install the intake manifold bolts with the aspirator tube, air pump bracket and kickdown linkage bracket in place, if equipped. Torque the bolts in sequence to 25 ft. lbs. (34 Nm). Repeat the sequence retightening the bolts to a final torque of 40 ft. lbs. (54 Nm) and repeat the second step to ensure all bolts are accurately torqued.

13. Clean and dry the valve cover mating surfaces, bolts and bolt holes. Install the valve covers with a new gasket. Torque the screws or nuts to 95 inch lbs. (11 Nm).

14. Connect the heater hose, upper radiator hose and the lower bypass hose clamp.

15. Connect the ignition coil, coolant temperature sending unit wire and all other connectors that were disconnected along the wiring harness.

16. Install the air conditioning com-

pressor, if equipped. Install the distributor cap and all spark plug wires.

17. Install air pump.

18. Connect all wires, hoses, cables and the fuel line to the carburetor or throttle body. Install the air cleaner assembly.

19. Fill the cooling system.

20. Connect the negative battery cable and check for leaks.

Exhaust Manifold

REMOVAL & INSTALLATION

3.9L, 5.2L and 5.9L Engines

1. Disconnect the negative battery cable. Remove the hot air tube and heat shield, if necessary.

2. Raise the vehicle and support safely. Remove the exhaust pipe from

Exhaust manifold installation—3.9L engine (right side shown)

Exhaust manifold installation—5.2L and 5.9L engines

the exhaust manifolds. Lower the vehicle.

3. Take note of all conical washer locations and remove the bolts, nuts and washers attaching the manifold to the head.

4. Remove the manifold.

To install:

5. If either of the end studs came out with the nuts, install a new stud using sealer on the coarse threads.

6. Position the manifold on the end studs. Install conical washers and nuts on the studs.

7. Install the remaining bolts and washers in their proper locations. The inner bolts are not mounted with washers. Working outward from the center, torque the bolts to 20 ft. lbs. (27 Nm) and the nuts to 15 ft. lbs. (20 Nm).

8. Install the exhaust pipe to the manifolds.

9. Connect the negative battery cable and check for exhaust leaks.

Combination Manifold

REMOVAL & INSTALLATION

3.7L Engine

1. Disconnect the negative battery cable and drain the cooling system.

2. Remove the air cleaner assembly and fuel line.

3. Disconnect all wires, hoses, linkages and cables from the carburetor.

4. Disconnect the diverter valve vacuum line from the intake manifold, if equipped.

5. Disconnect the exhaust pipe from the exhaust manifold. Unbolt the manifolds from each other and remove both manifolds from the vehicle.

To install:

6. Install a new combination intake and exhaust manifold gasket to the head.

7. Install the manifolds to the head using a new gasket between them and snug all nuts to about 20 inch lbs. Make sure the conical washers are installed with the cup side in.

8. Tighten the inner nut holding the manifolds together to 300 inch lbs. (34 Nm), then torque the outer 2 bolts to 260 inch lbs. (31 Nm).

9. Starting at the center and working outward, torque the manifold nuts on the head to 120 inch lbs. (14 Nm). Do not overtorque these nuts.

10. Connect the heater hose and bypass hose clamps.

11. Connect the wires, hoses, linkages and cables to the carburetor. Connect the fuel line.

12. Install the air tube with a new

gasket and install the diverter valve vacuum line, if equipped.

13. Connect the exhaust pipe to the manifold.

14. Install the air cleaner assembly.

15. Fill the cooling system.

16. Connect the negative battery cable and check for leaks.

Timing Chain Cover

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Drain the cooling system.

3. Remove the radiator, fan and all related parts. Remove the water pump from all engines except the 3.7L. The cover can be removed without removing the water pump on the 3.7L engine.

4. Remove the crankshaft pulley.

5. Remove the vibration damper using the proper puller. The cover can be removed from the 3.7L engine at this point.

6. Disconnect the fuel lines from the fuel pump, if equipped.

7. Remove the 2 front bolts from the oil pan.

8. Unbolt the chain cover from the block and remove, using caution to avoid damaging the oil pan gasket. Remove the fuel pump from the cover, if equipped.

To install:

9. Clean and dry the mating surfaces of the cover and block. Apply a thin bead of sealer to the oil pan gasket.

10. Install a new cover gasket and install the cover. Torque the bolts to 200 inch lbs. (23 Nm) on 3.7L engine and to 30 ft. lbs. (41 Nm) on 3.9L, 5.2L and 5.9L engines.

11. Install the water pump with a new gasket, if it was removed.

12. On 3.7L engine, install the vibration damper using tool C-3237A. On all other engines, install the damper with tool C-3638, install the bolt and washer and torque to specification. Apply a small amount of sealer to the bolts and install the crankshaft pulley.

13. Install the fuel pump using a new gasket, if equipped and connect the fuel lines. Install the 2 oil pan bolts, if they were removed.

14. Install the radiator, fan and all related parts.

15. Fill the cooling system.

16. Connect the negative battery cable and check for leaks.

Front Cover Oil Seal

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the belts from the crankshaft pulley.
3. Remove the fan and shroud from the vehicle.
4. Remove the crankshaft pulley.
5. Remove the vibration damper using the proper puller.
6. Using a suitable tool behind the lips of the oil seal, pry outward. Take care not to damage the crankshaft seal surface of the cover.

To install:

7. Install the new seal by installing the threaded shaft part of the special tool C-4251 into the threads of the crankshaft.
8. Place the seal into the opening with the spring toward the engine. Place the installing adapter C-4251-2 (3.7L engine) or C-4251-3 (3.9L, 5.2L and 5.9L engines) with the thrust bearing and nut on the shaft. Tighten the nut until the tool is flush with the timing chain cover. Remove the tool.
9. On 3.7L engine, install the vibration damper using tool C-3237A. On all other engines, install the damper with tool C-3638, install the bolt and washer and torque to specification.
10. Apply a small amount of sealer to the bolts and install the crankshaft pulley.
11. Install the fan and shroud.
12. Connect the negative battery cable and check for leaks.

Installing the front cover oil seal—3.9L, 5.2L and 5.9L engines

Alignment of timing marks—3.9L, 5.2L and 5.9L gasoline engines

Timing Chain and Gears

REMOVAL & INSTALLATION

1. If possible, crank the engine around so that the No. 1 cylinder is at TDC on the compression stroke. Remove the distributor cap to confirm and line the timing mark on the damper pulley with 0 on the timing scale. Thi007678 aid in aligning timing marks when installing the timing gears. Disconnect the negative battery cable.
2. Drain the cooling system.
3. Remove the radiator, fan and all related parts. Remove the water pump from all engines except the 3.7L engine. The cover can be removed without removing the water pump on the 3.7L engine.
4. Remove the crankshaft pulley.
5. Remove the vibration damper using the proper puller. The cover can be removed from the 3.7L engine at this point.
6. Disconnect the fuel lines from the fuel pump, if equipped.
7. Remove the 2 front bolts from the oil pan.
8. Unbolt the chain cover from the

Alignment of timing marks—3.7L engine

block and remove, using caution to avoid damaging the oil pan gasket. Remove the fuel pump from the cover, if equipped.

9. Remove the camshaft gear retaining bolt, cup washer and fuel pump eccentric, if equipped. Remove the timing chain and gears.

To install:

10. Place both camshaft and crankshaft gears on the bench with the timing marks on the exact imaginary center line through both gear bores as they are installed on the engine. Place

the timing chain around both sprockets.

11. Turn the crankshaft and camshaft so the keys line up with the keyways in the gears when the timing marks are in proper position.

12. Slide both gears over their respective shafts and use a straightedge to check timing mark alignment.

13. Install the fuel pump eccentric and cup washer, if equipped. Torque the camshaft gear retaining bolt to 35 ft. lbs. (47 Nm).

14. Clean and dry the mating surfaces of the timing chain cover and block. Apply a thin bead of sealer to the oil pan gasket.

15. Install a new cover gasket and install the cover. Torque the bolts to 200 inch lbs. (23 Nm) on 3.7L engine and to 30 ft. lbs. (41 Nm) on 3.9L, 5.2L and 5.9L engines.

16. Install the water pump with a new gasket, if it was removed.

17. On 3.7L engine, install the vibration damper using tool C-3237A. On all other engines, install the damper with tool C-3638, install the bolt and washer and torque to specification. Apply a small amount of sealer to the bolts and install the crankshaft pulley.

18. Install the fuel pump using a new gasket, if equipped and connect the

1 CHRYSLER FULL SIZE PICK-UP • RAMCHARGER • VAN

fuel lines. Install the 2 oil pan bolts, if they were removed.

19. Install the radiator, fan and all related parts.

20. Fill the cooling system.

21. Connect the negative battery cable, set all adjustments to specifications and check for leaks.

Camshaft

REMOVAL & INSTALLATION

1. If possible, crank the engine around so that the No. 1 cylinder is at TDC on the compression stroke. Remove the distributor cap to confirm and line the timing mark on the damper pulley with 0 on the timing scale. This will aid in aligning timing marks when installing the timing gears. If the vehicle is equipped with fuel injection, relieve the fuel pressure. Disconnect the negative battery cable.

2. Drain the cooling system.

3. Remove the valve cover(s).

4. Remove the rocker shaft assembly(s). Identify and remove the pushrods.

5. On 3.9L, 5.2L and 5.9L engines, remove the intake manifold. Identify and remove all lifters.

6. Remove the distributor. On 3.9L, 5.2L and 5.9L engines, lift out the oil pump and distributor driveshaft.

7. On 3.7L engine, remove the oil pump.

8. Remove the radiator, fan and all related parts.

9. Remove the fuel pump, if equipped. Remove the timing chain cover, timing chain and gears.

10. On 3.9L, 5.2L and 5.9L engines, note the location of the oil tab and remove the camshaft thrust plate.

11. Install suitable long bolt into the front of the camshaft to facilitate removal. Remove the camshaft, being careful not to damage any of the cam bearings with the cam lobes.

To install:

12. On 3.7L engine, lubricate the camshaft lobes and journals and install the camshaft into the block.

13. On 3.9L, 5.2L and 5.9L engines, install the camshaft to within 2 in. of its final installation position. Install the camshaft blocking tool C-3509 and bolt it in place with the distributor hold-down bolt. This will prevent the camshaft from being pushed in too far and knocking out the welch plug at the rear of the block. This tool should remain in place until the timing chain installation has been completed.

14. Install the camshaft thrust plate and chain oil tab, if equipped. Make sure the tang of the oil tab enters the hole in the thrust plate at the lower

right. Torque the bolts to 210 inch lbs. (24 Nm). Make sure the top edge of the oil tab is flat against the thrust plate or it will not feed oil to the chain.

15. Place both camshaft and crankshaft gears on the bench with the timing marks on the exact imaginary center line through both gear bores as they are installed on the engine. Place the timing chain around both sprockets.

16. Turn the crankshaft and camshaft so the keys line up with the keyways in the gears when the timing marks are in proper position.

17. Slide both gears over their respective shafts and use a straightedge to check timing mark alignment.

18. Install the fuel pump eccentric and cup washer, if equipped. Torque the camshaft gear retaining bolt to 35 ft. lbs. (47 Nm). Remove the camshaft blocking tool, if it was installed.

19. Measure camshaft endplay, if applicable. Replace the thrust plate if not within specifications.

20. On 3.9L, 5.2L and 5.9L engines,

coat the oil pump and distributor driveshaft with oil. Install 3.9L engine shaft so that when the gear spirals into place and drops into the oil pump, the slot in the top of the gear is pointing directly to the left front intake manifold bolt hole. Install 5.2L and 5.9L engine shaft in a similar manner, except position it so that the slot is parallel with the center line of the camshaft.

21. If the camshaft was not replaced, lubricate and install the lifters in their original locations. If the camshaft was replaced, new lifters must be used.

22. Install the pushrods and rocker shaft assembly(s).

23. Install the intake manifold, if it was removed. Install the valve cover(s).

24. Install the distributor so the rotor points to the No. 1 spark plug wire position on the cap.

25. On 3.7L engine, install the oil pump.

26. Install the timing chain cover and all related parts, fuel pump if equipped, and radiator.

Installed distributor drive gear position—3.9L engine

Installed distributor drive gear position—5.2L and 5.9L gasoline engine

27. When everything is bolted in place, change the engine oil and replace the oil filter.

NOTE: If the camshaft or lifters have been replaced, add 1 pint of Mopar crankcase conditioner, or equivalent when replenishing the oil to aid in break in. This mixture should be left in the engine for a minimum of 500 miles and drained at the next normal oil change.

28. Fill the radiator with coolant.

29. Connect the negative battery cable, set all adjustments to specifications and check for leaks.

Piston and Piston Rings

POSITIONING

Piston positioning—3.7L engine

DIESEL ENGINE MECHANICAL

NOTE: Disconnecting the negative battery cable on some vehicles may interfere with the functions of the on board computer systems and may require the computer to undergo a relearning process, once the negative battery cable is reconnected.

Engine

REMOVAL & INSTALLATION

CAUTION

This engine has a dry weight of 880 lbs. Make sure the engine removal equipment is rated adequately, or personal injury may result.

1. Remove the hood.
2. Disconnect the negative cable from the battery and from the engine.
3. Drain the coolant.
4. Remove the radiator, shroud, belt, fan and all related parts.
5. Remove the intake and exhaust pipes from the turbocharger.
6. Disconnect the air conditioner connections. Cover the openings on the compressor.
7. Disconnect the alternator and all other electrical connections to the engine.
8. Disconnect the accelerator linkage.
9. Disconnect the throttle linkage from the control lever, but do not remove the control lever from the injection pump.
10. Disconnect all engine driven accessories.
11. Raise the vehicle and support safely. Remove the starter.
12. If equipped with automatic transmission, remove the torque converter bolts and remove the lower bellhousing bolts. If equipped with manual transmission, remove the transmission.
13. Drain the oil from the engine.
14. Disconnect the transmission oil cooler lines from their brackets, if equipped.
15. Disconnect the exhaust pipe from the turbocharger. Lower the vehicle.
16. Disconnect and plug the fuel lines.
17. Using the proper equipment, hoist the engine slightly using the lifting eyes and support the transmission, if still installed.
18. Remove the motor mounts.

A-EXPANDER GAPS B-RAIL GAPS

Piston ring and piston installation—5.2L and 5.9L gasoline engines; 3.9L engine is similar

19. Remove the upper bellhousing bolts.

20. Remove the engine from the vehicle.

To install:

21. Position the engine in the engine compartment and install the motor mounts. Torque the nuts and bolts to 57 ft. lbs. (77 Nm).

22. Install the bellhousing bolts and torque converter bolts, if equipped. Install the manual transmission, if equipped.

23. Install the starter.

24. Connect the exhaust pipe.

25. Connect the transmission oil cooler lines to their brackets, if equipped.

26. Connect the fuel lines.

27. Connect the power steering lines.
28. Connect all engine driven accessories.

29. Connect the accelerator linkage.

30. Connect the throttle linkage to the control lever.

31. Connect the air conditioner connections.

32. Connect the alternator and all other electrical connections to the engine.

33. Install the intake and exhaust pipes to the turbocharger.

34. Install the fan and all related parts, shroud and radiator.

35. Fill the engine with the proper amount of diesel engine oil.

36. Fill the radiator with coolant.

37. Connect the negative battery cable, set all adjustments to specifications and check for leaks.

Cylinder Head

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Drain the coolant.

3. Disconnect the radiator hose and heater hoses.

4. Remove the turbocharger and air crossover.

5. Remove the exhaust manifold.

6. Remove all fuel lines from the injection pump and injector nozzles. Remove the fuel filter.

7. Remove the valve covers.

8. Remove the rocker arms and pushrods.

9. Unbolt the cylinder head from the block. Remove the cylinder head.

10. Inspect the coolant passages. A large accumulation of rust or lime will require service to the block.

11. Inspect the surface of the head for flatness. The maximum variation

is 0.0004 in. (0.010mm) within any 2 in. diameter area or 0.012 in. (0.30mm) overall end to end or side to side.

To install:

12. Thoroughly clean and dry the mating surfaces of the head and block. Position the new head gasket on the dowels.

13. Install the head onto the dowels on the block.

14. Lubricate the pushrod sockets and install the pushrods and rocker arms.

15. Clean, dry and lightly lubricate the head bolts. Install and torque in sequence first to 29 ft. lbs. (40 Nm), then to 62 ft. lbs. (85 Nm) and finally to 93 ft. lbs. (126 Nm).

16. Install the rocker arm pedestal bolts. Torque to 18 ft. lbs. (24 Nm).

17. Adjust the valve clearance.

18. Install the valve covers with new gaskets. Torque the bolts to 18 ft. lbs. (24 Nm).

19. Install all fuel lines and the fuel filter.

20. Install the exhaust manifold.

21. Install the turbocharger and air crossover.

22. Connect the radiator hose and heater hoses.

23. Fill the radiator with coolant.

24. Connect the negative battery cable, set all adjustments to specifications and check for leaks.

Valve Clearance

ADJUSTMENT

1. Perform the adjustment when the engine is below 140°F (60°C).

2. Disconnect the negative battery cable.

3. Use the timing pin to locate TDC for cylinder No. 1. Disengage the pin.

Cylinder head bolt tightening sequence—5.9L diesel engine

4. Remove the valve covers.
5. With the engine in this position, the first group of valves may be adjusted:

No. 1 intake: 0.10 in. (0.254mm)
 No. 1 exhaust: 0.20 in. (0.508mm)
 No. 2 intake: 0.10 in. (0.254mm)
 No. 3 exhaust: 0.20 in. (0.508mm)
 No. 4 intake: 0.10 in. (0.254mm)
 No. 5 exhaust: 0.20 in. (0.508mm)

6. Mark the pulley and rotate the engine 360 degrees.

7. With the engine in this position, the second group of valves may be adjusted:

No. 2 exhaust: 0.20 in. (0.508mm)
 No. 3 intake: 0.10 in. (0.254mm)
 No. 4 exhaust: 0.20 in. (0.508mm)
 No. 5 intake: 0.10 in. (0.254mm)
 No. 6 intake: 0.10 in. (0.254mm)
 No. 6 exhaust: 0.20 in. (0.508mm)

8. Torque all locknuts to 18 ft. lbs. (24 Nm).

9. Install the valve covers with new gaskets. Torque the bolts to 18 ft. lbs. (24 Nm).

10. Connect the negative battery cable.

First group of valves to be adjusted—5.9L diesel engine

Second group of valves to be adjusted—5.9L diesel engine

Rocker Arm and Pedestal Assembly

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the valve cover.
3. Loosen the adjusting screw locknuts. Loosen the screws until they stop.
4. Remove the 8mm bolt and 12mm head bolt from the pedestal.
5. Remove the pedestal and rocker arm assembly. Remove the pushrods if necessary.
6. Remove the retaining ring and thrust washer.
7. Remove the rocker arm from the pedestal.

NOTE: Do not disassemble the rocker shaft and pedestal; they must be replaced as an assembly.

8. Remove the locknut and adjusting screw from the rocker arm.

To install:

9. Install the adjusting screw and locknut.

10. Lubricate the shaft with oil and install the rocker arm to the shaft. Install the thrust washer and snapring.

11. Install the pushrods to the engine if they were removed.

12. Install the pedestal and rocker arm assembly to the head aligning the dowel in the pedestal with the dowel bore in the head. If the pushrod is holding the pedestal off of the head,

Removing the rocker arm and pedestal assembly

Removing or installing the rocker arm from the pedestal

Intake Exhaust

Proper rocker arm installation—5.9L diesel engine

turn the engine until the pedestal will set on the head without interference.

13. Lubricate the threads of the bolt with oil. Install and torque first to 29 ft. lbs. (40 Nm), then to 62 ft. lbs. (85 Nm) and finally to 93 ft. lbs. (126 Nm). If all of the pedestals were removed, follow the entire head bolt torque sequence including those head bolts that were not removed in this procedure.

14. Tighten the 8mm bolts to 18 ft. lbs. (24 Nm).

15. Adjust the valves.

16. Install the valve cover with a new gasket. Torque the bolts to 18 ft. lbs. (24 Nm).

17. Connect the negative battery cable.

Intake Manifold Cover and Gasket

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the throttle control bracket and linkage.

3. Remove the high pressure fuel lines.

4. Disconnect the intake manifold heater.

5. Disconnect the fuel heater ground wire from the intake manifold.

6. Remove the air crossover tube and the intake manifold heater.

7. Remove the manifold cover and gasket. Clean the gasket sealing surface.

To install:

8. Install the new gasket and cover. Some of the bolt holes are drilled through. Apply liquid teflon sealant to these bolts. Torque all bolts to 18 ft. lbs. (24 Nm).

9. Assemble all intake piping and intake manifold heater with the throttle control bracket and linkage.

10. Connect the fuel heater ground wiring.

11. Install and bleed the high pressure fuel lines.

12. Connect the negative battery cable.

Exhaust Manifold

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Disconnect the air intake hose and exhaust pipe from the turbo.

3. Remove the turbocharger and gasket.

4. Remove the cab heater supply and return lines.

5. Remove the exhaust manifold and gasket. Clean the gasket sealing surface.

To install:

6. Install the new gasket and manifold. Torque the exhaust manifold bolts in sequence to 32 ft. lbs. (43 Nm).

7. Install the cab heater supply and return lines.

8. Install the turbocharger and gasket.

9. Connect the air intake and exhaust piping.

10. Connect the negative battery cable and check for exhaust leaks.

Exhaust manifold bolt torque sequence—5.9L diesel engine

9. Install the turbocharger and torque the mounting nuts to 24 ft. lbs. (32 Nm).

10. Install the air crossover hose.

11. Install a new gasket and install the oil drain tube. Torque the bolts to 18 ft. lbs. (24 Nm).

12. New turbochargers must be prelubricated with fresh engine oil before operation. To do so, pour about 2 or 3 oz. of oil into the supply fitting and rotate the turbine wheel to circulate the oil.

13. Install the oil supply line to the turbocharger.

14. Connect the intake and exhaust piping.

15. Connect the negative battery cable and check for exhaust leaks.

Turbocharger

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Loosen the air crossover hose.

3. Disconnect the intake hose and exhaust pipe.

4. Remove the oil drain tube bolts.

5. Remove the oil supply line from the turbocharger.

6. Remove the turbocharger mounting nuts and remove the turbocharger.

To install:

7. Inspect the mounting surface for cracks and damage.

8. Install a new gasket and apply anti-sieze compound to the mounting studs.

Timing Gear Cover

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the fan drive assembly and belt.

3. Remove the belt tensioner.

4. Remove the oil fill tube and adaptor.

5. Remove the crankshaft pulley.

6. Remove all bolts that attach the cover to the gear housing.

7. Gently pry the gear cover away from the housing and remove from the engine.

Intake manifold cover and gasket—5.9L diesel engine

To install:

8. Clean the gasket sealing surfaces.
9. Lubricate the gear train with oil.
10. Thoroughly clean and dry the seal area of the crankshaft.
11. Install the front cover and a new gasket. Install the bolts finger tight.
12. Using the alignment/installation tool, align the cover to the crankshaft.
13. Torque the cover bolts to 18 ft. lbs. (24 Nm). Remove the tool.
14. Install the oil fill tube and adaptor.
15. Install the crankshaft pulley, but do not torque the bolts at this point.
16. Install the fan, belt tensioner and belt.
17. Torque the crankshaft pulley bolts to 92 ft. lbs. (125 Nm).
18. Connect the negative battery cable and check for leaks.

Front Cover Oil Seal

REPLACEMENT

1. Disconnect the negative battery cable.
2. Remove the drive belt.
3. Remove the crankshaft pulley.
4. Drill two 1/8 in. holes into the seal face, 180 degrees apart.
5. Using a slide hammer with a No. 10 sheet metal screw, pull the seal out alternating from side to side until the seal is out.
6. Thoroughly clean and dry the crankshaft.
7. Apply a bead of Loctite®277 to the outside diameter of the seal.
8. Install the pilot from the seal kit onto the crankshaft.
9. Install the seal onto the pilot and start it into the front cover seal bore. Remove the pilot.
10. Use the alignment/installation tool and a plastic hammer to fully install the seal.
11. Install the crankshaft pulley, but do not torque the bolts at this point.
12. Install the drive belt.
13. Torque the crankshaft pulley bolts to 92 ft. lbs. (125 Nm).
14. Connect the negative battery cable and check for leaks.

Camshaft

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the valve covers.
3. Remove the rocker pedestals and arm assemblies.
4. Remove the pushrods.
5. Remove the drive belt.
6. Drain the cooling system. Remove the fan assembly, radiator and all related parts.

7. Remove the crankshaft pulley.
8. Remove the front gear cover.
9. Remove the fuel pump.
10. Insert the special dowels into the pushrod holes and onto the top of each lifter. When properly installed, the dowels can be used to hold the tappets up securely. Wrap rubber bands around the top of the dowels to prevent them from dropping down.
11. Rotate the crankshaft to align

the crankshaft to camshaft timing marks.

12. Remove the bolts from the thrust plate.
13. Remove the camshaft and thrust plate.
14. Press the gear from the camshaft and remove the key.

To install:

15. Install the key on the camshaft.
16. Heat the camshaft gear to 250°F

ALIGNMENT/INSTALLATION TOOL

Aligning the cover with the crankshaft

Crankshaft gear and camshaft gear timing marks—5.9L diesel engine

Removing the thrust plate bolts

(121°C) for 45 minutes. Lubricate the gear mount surface with Lubriplate 105. Install the gear to the camshaft with the timing marks facing away from the shaft.

17. Lubricate the camshaft bores, lobes, journals and thrust washer with Lubriplate 105.

NOTE: Do not push the camshaft in too far or it may dislodge the plug in the rear of the camshaft bore, possibly creating a leak.

18. Install the camshaft and thrust washer so the E timing mark on the injection pump gear aligns with the C timing mark on the camshaft gear and the timing mark on the crankshaft gear align with those on the camshaft gear.

19. Install the thrust washer bolts and torque to 18 ft. lbs. (24 Nm).

20. Check the endplay of the camshaft. The specification is 0.006–0.010 in. (0.152–0.254mm).

21. Check the backlash of the camshaft gear. The specification is 0.003–0.013 in. (0.080–0.330mm).

22. Install the tappets and pushrods.

23. Install the rocker pedestal and arm assemblies.

24. Install the front cover and crankshaft pulley.

25. Install the drive belt and fan assembly.

26. Install the fuel pump.

27. Adjust the valves.

28. Install the valve covers.

29. Connect the negative battery cable and check for leaks.

Camshaft gear and injection pump gear timing marks—5.9L diesel engine

Piston and Connecting Rod POSITIONING

The "FRONT" marking and the number on the rod should be oriented as shown—5.9L diesel engine

ENGINE LUBRICATION

Oil pan

REMOVAL & INSTALLATION

3.7L Engine

1. Disconnect the negative battery cable.
2. Remove the oil dipstick.
3. Raise the vehicle and support safely. Drain the engine oil.
4. Remove the engine to transmission strut.

5. Remove the torque converter inspection cover, if equipped.

6. Remove the oil pan bolts and remove the pan from the vehicle.

To install:

7. Using a new pan gasket set, apply a thin bead of sealer to the 4 corners where the rubber seals and cork gasket meet.

8. Thoroughly clean and dry all bolts and bolt holes. Install the pan and tighten the bolts to 75 inch lbs. (4 Nm), then retighten to 200 inch lbs. (23 Nm).

9. Install the torque converter inspection cover, if equipped.

10. Install the engine to transmission strut. Lower the vehicle.

11. Install the dipstick.

12. Fill the engine with the proper amount of oil.

13. Connect the negative battery cable and check for leaks.

Except 3.7L Engine

1. Disconnect the negative battery cable.

2. Remove the engine oil dipstick.

3. On Vans, remove the engine cover. Remove the air intake duct.

4. Raise the vehicle and support safely. Drain the engine oil.

5. Remove the transmission support braces.

6. Remove the starter and torque converter inspection cover, if equipped.

7. Remove the oxygen sensor and air injection tube, if equipped.

8. Lower the exhaust crossover pipe.

9. Remove the engine mount nuts.

10. Using the proper equipment, support the transmission. Remove the transmission mount bolts.

11. Support the engine with a jackstand. Raise the engine and transmission as required to allow for pan removal.

12. Remove the oil pan bolts and remove the pan from the vehicle.

To install:

13. Using a new pan gasket set, apply a thin bead of sealer to the 4 corners where the rubber seals and cork gasket meet.

14. Thoroughly clean and dry all bolts and bolt holes. Install the pan and tighten the bolts to 75 inch lbs. (4 Nm), then retighten to 200 inch lbs. (23 Nm).

15. Lower the engine and transmission and install the engine mount nuts and transmission mount bolts.

16. Install the exhaust crossover pipe. Install the oxygen sensor and air injection tube, if equipped.

17. Install the torque converter inspection cover, if equipped. Install the starter and support braces. Lower the vehicle.

18. Install the dipstick, air intake duct and engine cover, if it was removed.

19. Fill the engine with the proper amount of oil.

20. Connect the negative battery cable and check for leaks.

Oil Pump

REMOVAL & INSTALLATION

3.7L Engine

1. Disconnect the negative battery cable.

2. Raise the vehicle and support safely.

3. Remove the oil filter.

4. The outer rotor will drop out when the pump cover is removed. Remove the oil pump cover and outer rotor.

5. Remove the oil pump.

To install:

6. Prime the pump by pouring fresh oil into the pump intake and turning the driveshaft until oil comes out the pressure port. Repeat a few times until no air bubbles are present. Using a new gasket, install the oil pump to the engine without the rotor and cover. Torque the bolts to 200 inch lbs. (23 Nm).

7. Install the outer rotor, seal and cover. Torque the cover bolts to 130 inch lbs. (15 Nm).

8. Install a new oil filter.

9. Connect the negative battery cable and check the oil pressure.

3.9L, 5.2L and 5.9L Gasoline Engines

1. Disconnect the negative battery cable.

2. Remove the oil pan.

3. Remove the screen.

4. Unbolt the oil pump from the rear main bearing cap and remove it from the vehicle.

To install:

5. Prime the pump by pouring fresh oil into the pump intake and turning the driveshaft until oil comes out the pressure port. Repeat a few times until no air bubbles are present. Install the oil pump with a rotating motion to ensure proper pump driveshaft engagement.

6. Hold the pump flush against the main cap and finger-tighten the attaching bolts.

7. Torque the bolts to 30 ft. lbs. (41 Nm).

8. Install the screen.

9. Install the oil pan with a new gasket.

10. Connect the negative battery cable and check the oil pressure.

5.9L Diesel Engine

1. Disconnect the negative battery cable.

2. Remove the drive belt.

3. Remove the radiator.

4. Remove the fan assembly.

5. Remove the oil fill tube and adaptor.

6. Remove the crankshaft pulley.

7. Remove the front cover.

8. Remove the 4 pump mounting bolts and remove the pump from the block.

To install:

9. Prime the pump by pouring fresh oil into the pump intake and turning the driveshaft until oil comes out the pressure port. Repeat a few times until no air bubbles are present. Align the idler gear pin with the locating bore in the block and install the pump.

10. Tighten the mounting bolts in the proper sequence to 44 inch lbs. (5

Nm), then repeat the sequence torquing to 18 ft. lbs. (24 Nm).

NOTE: When the pump is correctly installed, the flange on the pump should not touch the block; the back plate on the pump seats against the bottom of the bore.

11. Measure the backlash of the idler to pump drive gears. The specification is 0.003–0.013 in. (0.08–0.33mm).

12. Measure the backlash of the idler to crankshaft gears. The specification is 0.003–0.013 in. (0.08–0.33mm).

13. Install the front cover and crankshaft pulley.

14. Install the oil fill tube and adaptor.

15. Install the fan assembly, radiator and drive belt.

16. Connect the negative battery cable and check the oil pressure.

CHECKING

3.7L Engine

1. Press off the drive gear. Disassemble the remainder of the pump.

2. Replace the pump assembly if the cover is scratched or grooved or if the cover is warped more than 0.0015 in. (0.038mm).

3. The minimum thickness of the outer rotor is 0.825 in. (20.96mm). The minimum diameter of the outer rotor is 2.469 in. (62.70mm). The minimum thickness of the inner rotor is 0.825 in. (20.96mm). If any of the above measurements are not within specifications, replace the shaft and both rotors.

4. The maximum clearance between the outer rotor and the pump body is 0.014 in. (0.356mm). Replace the pump assembly if not within specifications.

Oil pump attaching bolts tightening sequence—5.9L diesel engine

Exploded view of the oil pump—3.7L engine

5. Install the inner rotor and place a straightedge across the bolt holes. If a feeler gauge of 0.004 in. (0.101mm) or more fits, replace the pump assembly.

6. The maximum clearance between the rotors is 0.010 in. (0.254mm). Replace the shaft and both rotors if not within specifications.

7. Inspect the relief valve plunger for scoring. Small marks may be removed with 400-grit wet or dry sandpaper.

8. The relief valve spring should have a frelength of 2¼ in. Replace the spring if it fails to meet the specification.

9. Assemble the pump using new parts where necessary.

3.9L, 5.2L and 5.9L Gasoline Engines

1. Disassemble the pump.

2. Replace the pump assembly if the cover is scratched or grooved or if the cover is warped more than 0.0015 in. (0.038mm).

3. The minimum thickness of the outer rotor is 0.825 in. (20.96mm) for 3.9L and 5.2L engine and 1987-90 5.9L engine. The specification is 0.943 in. (23.90mm) for 1986 5.9L engines.

The minimum diameter of the outer rotor is 2.469 in. (62.70mm). The minimum thickness of the inner rotor is 0.825 in. (20.96mm) for 3.9L and 5.2L engine and 1987-90 5.9L engine. The specification is 0.943 in. (23.90mm) for 1986 5.9L engines. If any of the above measurements are not within specifications, replace the shaft and both rotors.

4. The maximum clearance between the outer rotor and the pump body is 0.014 in. (0.356mm). Replace the pump assembly if not within specifications.

5. Install the inner rotor and place a straightedge across the bolt holes. If a feeler gauge of 0.004 in. (0.101mm) or more fits, replace the pump assembly.

6. The maximum clearance between the rotors is 0.010 in. (0.254mm). Replace the shaft and both rotors if not within specifications.

7. Inspect the relief valve plunger for scoring. Small marks may be removed with 400-grit wet or dry sandpaper.

8. The relief valve spring should have a frelength of about 2 in. Replace the spring if it fails to meet specifications.

Exploded view of the oil pump—5.2L and 5.9L gasoline engines

9. Assemble the pump using new parts where necessary.

5.9L Diesel Engine

1. Inspect the drive and idle gears for damage of any type. The maximum backlash between the gears is 0.015 in. (0.38mm).

2. Remove the back plate.

3. The maximum tip clearance of the rotors is 0.007 in. (0.178mm).

4. Place a straightedge across the rotors. The maximum clearance is 0.005 in. (0.127mm).

5. The maximum rotor to body clearance is 0.015 in. (0.381mm).

6. Remove the rotor and inspect all parts for visible damage.

7. Assemble the pump using new parts where necessary.

Rear Main Bearing Oil Seal

The 3.9L and 5.2L engine rear main seal is a 2 piece, fitted rope type seal. The 3.7L and 5.9L engine rear main seal is a split rubber type. In all cases, the upper half can be installed with the crankshaft in place. The 2 halves should always be replaced as a set.

REMOVAL & INSTALLATION

3.7L Engine

1. Disconnect the negative battery cable.

2. Raise the vehicle and support safely. Drain the engine oil. Remove the oil pan.

3. Remove the rear seal retainer and the rear main bearing cap.

4. Remove the lower seal from the retainer.

5. To remove the upper seal, press on one end of the seal with a small blunt tool, rotate the crankshaft slightly and pull out the other end of the seal.

To install:

6. Wipe the crankshaft surface clean and coat it lightly with oil.

7. When installing the upper seal, hold the seal (with the paint stripe to the rear) tightly against the crankshaft and position the shim protector supplied with the seal package between the seal lip and the sharp edge of the groove in the block.

8. Rotate the crankshaft while sliding the seal into the groove. If any rubber has peeled off of the back of the new seal, do not use it; it will leak.

9. When installing the lower seal, apply a ⅛ in. bead of sealer in the bottom of the groove extending up to within ½ in. from the top of the groove.

10. Install the seal in the retainer

Apply sealer to these locations—3.7L engine

with the paint stripe facing the rear.

11. Install the side seals on the retainer using super bonder, or equivalent.

12. Apply a very small amount of sealer to the areas around the bolt holes on the top of the retainer. Do not allow any sealer to get onto the top surface of the seal lip.

13. Install the retainer and torque the bolts to 30 ft. lbs. (41 Nm).

14. Install the main cap and torque the bolts to 85 ft. lbs. (115 Nm).

15. Install the pan and fill the engine with the proper amount of oil.

16. Connect the negative battery cable and check for leaks.

3.9L and 5.2L Engine

1. Raise the vehicle and support safely. Drain the engine oil. Remove the oil pan and oil pump.

2. Remove the rear main bearing cap.

3. Remove the lower seal from the cap.

4. To remove the upper rope seal, use oil seal remover and installer kit KD-492, or equivalent, following the instructions provided with the tool.

To install:

5. Wipe the crankshaft surface clean and coat it lightly with oil.

6. Use oil seal remover and installer kit KD-492, or equivalent to install the upper rope seal. Trim the ends of the upper seal to eliminate frayed ends.

7. Install the lower rope seal in the main cap so that both ends protrude. Use tool C-3511 to seat the seal in its groove. Cut off the portions of the seal that extend above the cap on both sides and install the end seals to the cap.

8. Install the main cap to the block and torque the bolts to 85 ft. lbs. (115 Nm).

9. Install the pan and fill the engine with the proper amount of oil.

10. Connect the negative battery cable and check for leaks.

5.9L Gasoline Engine

1. Raise the vehicle and support safely. Drain the engine oil. Remove the oil pan and oil pump.

2. Remove the rear main bearing cap.

3. Remove the lower seal from the cap.

4. To remove the upper seal, press on one end of the seal with a small blunt tool, rotate the crankshaft slightly and pull out the other end of the seal.

To install:

5. Wipe the crankshaft surface clean and coat it lightly with oil.

6. When installing the upper seal, hold the seal (with the paint stripe to the rear) tightly against the crankshaft and rotate the crankshaft while sliding the seal into the groove. If any rubber has peeled off of the back of the new seal, do not use it; it will leak.

7. When installing the lower rubber seal, make sure the paint stripe is positioned to the rear and place a drop of sealer next to both ends of the seal.

8. Install the main cap to the block and torque the bolts to 85 ft. lbs. (115 Nm).

9. Install the oil pump and pan and fill the engine with the proper amount of oil.

10. Connect the negative battery cable and check for leaks.

5.9L Diesel Engine

The rear crankshaft seal is mounted in a housing that is bolted to the rear of the block. A double lipped teflon seal is used.

1. Disconnect the negative battery cable.

2. Remove the transmission.

3. Remove the clutch cover and plate, if equipped.

4. Remove the flywheel.

5. Drill two 1/8 in. holes 180 degrees apart into the seals. Be extremely careful not to drill against the crankshaft.

6. Using a No. 10 sheet metal screw and a slide hammer, remove the rear seal.

To install:

7. Thoroughly clean and dry the crankshaft surface. Do not oil the crankshaft or seal prior to installation or the seal will leak.

8. Install the seal pilot included in the replacement seal kit, on the crankshaft. Push the seal on the pilot and crankshaft. Remove the pilot.

Lower rear main seal—5.9L gasoline engine

1 CHRYSLER FULL SIZE PICK-UP • RAMCHARGER • VAN

9. If the new seal has a rubber outer diameter, lubricate it with soapy water. If the seal does not have a rubber outer diameter, use Loctite®277, or equivalent on the outer diameter.

10. Use the alignment tool to install the seal to the proper depth in the housing. Drive the seal in gradually and evenly until the alignment tool stops against the housing.

MANUAL TRANSMISSION

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

Transmission Assembly

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the shift lever. If the vehicle is equipped with the NP-435 4 speed, push the retainer (not the gearshift lever itself) down and rotate it counterclockwise slightly to release. If the vehicle is equipped with the NP-2500 5 speed, unbolt the shifter base assembly from the transmission. If the vehicle is equipped with the A-833 4 speed, label and disconnect the linkages to the shifter assembly and unbolt the shifter from its support.

3. Raise the vehicle and support safely. Remove the skid plates, if equipped. Drain the transmission and transfer case, if equipped.

4. Disconnect the distance sensor, if equipped and disconnect the speedometer cable from the transmission or transfer case.

5. Matchmark and remove the driveshaft(s). Disconnect the PTO, if equipped.

6. If equipped with 4WD, disconnect all linkage, electrical connectors and vacuum lines from the transfer case. Using a suitable jack, support the transfer case, unbolt the transfer case from the transmission and slide it backwards to remove it from the vehicle.

7. Disconnect the reverse light switch connector and remove all wiring from any clips on the transmission case.

8. Install an appropriate engine support fixture to hold the engine in place when the transmission is out of the vehicle.

New Process 2500 transmission

New Process 435 shifter components

Getrag G-360 transmission coupled with the 5.9L diesel engine

9. Support the transmission with a suitable transmission jack.
10. Remove the transmission crossmember.
11. Remove the transmission to bell housing bolts.
12. Slide the transmission backwards until the input shaft clears the clutch disc. Remove the transmission from the vehicle.

To install:

13. Lubricate the pilot bushing and input shaft splines very lightly with high temperature lubricant.
14. Mount the transmission securely on a suitable transmission jack and lift it in place until the input shaft is centered in the bell housing opening. Roll the transmission forward until the input shaft splines fully engage with the clutch disc.
15. Install the transmission to bell housing bolts. Torque the bolts to 50 ft. lbs. (68 Nm).
16. Install the transmission crossmember. Remove the transmission and engine support fixtures.
17. Install the transfer case and connect all linkage, electrical connectors and vacuum lines to the transfer case.
18. Connect the reverse light switch connector and clip all wiring to the transmission case.
19. Connect speedometer cable and distance sensor, if equipped.
20. Install the driveshaft(s) and connect the PTO, if equipped.
21. Fill the transmission and transfer case, if equipped, with the proper lubricant.
22. Install the shifter assembly and linkages, if equipped.
23. Install the skid plates, if equipped.
24. Connect the negative battery cable and check the transmission for proper operation.

LINKAGE ADJUSTMENT

A-833 4 Speed

1. Place the shifter in the neutral position.
2. Raise the vehicle and support safely.
3. Install the fabricated aligning tool to hold the levers in the neutral crossover position.
4. Disconnect the control rods from the levers in the shifter assembly. Make sure the levers are still in the neutral position.
5. Rotate the threaded ends of the shift control rods to adjust the rod length. Starting with the 1/2 rod, adjust it so the fabricated tool does not bind. Repeat with the 3/4 and the reverse rods.
6. Install the rods to their levers

with the washers and clips.

7. Remove the alignment tool and check the shifting action for smoothness.

CLUTCH

Clutch Assembly

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Raise the vehicle and support safely.
3. Remove the transmission and transfer case, if equipped.
4. Remove the inspection cover at the bottom of the bell housing.
5. Rotating the engine with a fly-wheel turner, remove the clutch cover bolts gradually as they appear.
6. Remove the clutch cover and disc by lowering it through the opening at the bottom of the housing.

To install:

7. Raise the clutch cover and disc into place and use a suitable clutch aligning tool or spare input shaft to center the disc. Tighten all of the bolts finger tight.
8. The cover bolts must be turned gradually, evenly and to the proper torque to avoid distorting the cover. Torque $\frac{5}{16}$ in. diameter bolts in the aforementioned manner to 17 ft. lbs (23 Nm). Torque $\frac{3}{8}$ in. diameter bolts similarly to 30 ft. lbs. (41 Nm).
9. Install the transmission and transfer case, if equipped.
10. Install the inspection cover.
11. Connect the negative battery cable and check the clutch for proper operation.

PEDAL FREE-PLAY ADJUSTMENT

NOTE: Chrysler has used a hydraulic clutch release system on their full size trucks since 1988. There is no adjustment for free-play on vehicles with this system.

1. Inspect the clutch pedal rubber stop and replace if it is damaged.
2. Raise the vehicle and support safely.
3. Adjust the fork by turning the self-locking nut on the actuating rod to provide about $\frac{3}{32}$ in. of movement at the end of the fork. This will provide about 1 in. of free-play at the clutch pedal.

Clutch Master Cylinder and Slave Cylinder

The clutch master cylinder, remote reservoir, slave cylinder and connecting lines are all serviced as a complete assembly. The cylinders and connecting lines are sealed units. They are prefilled with fluid from the factory and cannot be disassembled or serviced separately.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Raise the vehicle and support safely.
3. Remove the nuts attaching the slave cylinder to the bell housing.
4. Remove the slave cylinder and clip from the housing.
5. Lower the vehicle.
6. Remove the locating clip from the clutch master cylinder mounting bracket.
7. Remove the retaining ring, flat washer and wave washer that attach the clutch master cylinder pushrod to the clutch pedal. Slide the pushrod off of the pedal pin. Inspect the bushing on the pedal pin and replace if it is excessively worn.

1 CHRYSLER FULL SIZE PICK-UP • RAMCHARGER • VAN

Hydraulic clutch release components—Pick-Up and Ramcharger

8. Verify that the cap on the clutch master cylinder reservoir is tight so that fluid will not spill during removal.

9. Remove the screws attaching the reservoir and bracket, if equipped, to the dash panel and remove the reservoir.

10. Pull the clutch master cylinder rubber seal from the dash panel.

11. Rotate the clutch master cylinder 45 degrees to unlock it. Remove the cylinder from the dash panel.

12. Remove the clutch master cylinder, remote reservoir, slave cylinder and connecting lines from the vehicle.

To install:

13. Verify that the cap on the fluid reservoir is tight so that fluid will not spill during installation.

14. Position the components in the replacement kit in their places on the vehicle.

15. Insert the master cylinder in the dash. Rotate it 45 degrees to lock it in place.

16. Lubricate the rubber seal with a suitable lubricant to ease installation.

Seat the seal around the cylinder in the dash.

17. Install the fluid reservoir and bracket, if equipped, to the dash panel.

18. Install the master cylinder pushrod to the clutch pedal pin. Secure the rod with the wave washer, flat washer and retaining ring. Install the locating clip. Do not remove the plastic shipping stop from the pushrod until the slave cylinder has been installed.

19. Raise the vehicle and support safely.

20. Insert the slave cylinder pushrod through the opening and make sure the cap on the end of the pushrod is securely engaged in the release lever before tightening the attaching nuts. Torque the nuts to 200 inch lbs. (23 Nm).

21. Lower the vehicle. Remove the plastic shipping stop from the master cylinder pushrod.

22. Operate the clutch pedal a few times to verify proper operation of the system.

23. Connect the negative battery cable and road test the vehicle.

AUTOMATIC TRANSMISSION

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

Transmission Assembly

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Raise the vehicle and support safely. Drain the transmission and transfer case, if equipped.

3. Disconnect and lower or remove any exhaust parts as required.

4. Remove the skid plates, if equipped.

5. Matchmark and remove the

driveshaft(s).

6. Disconnect the distance sensor, if equipped and the speedometer cable.

7. If equipped with 4WD, disconnect all linkage, electrical connectors and vacuum lines from the transfer case. Using a suitable jack, support the transfer case, unbolt the transfer case from the transmission and slide it backwards to remove it from the vehicle.

8. Remove the engine to transmission struts.

9. Remove the starter and the fluid cooler lines bracket.

10. Remove the torque converter inspection cover.

11. Matchmark the converter to the flex plate. Remove the torque converter bolts.

12. Disconnect the wires to the neutral safety switch, and lockup solenoid, if equipped.

13. Disconnect the oil cooler lines from the transmission.

14. Disconnect the gearshift rod and torque shaft assembly from the transmission.

15. Disconnect the throttle rod from the lever.

16. Unbolt the oil filler tube brace and lift the oil filler tube out of its bore.

17. Install an appropriate engine support fixture to hold the engine in place when the transmission is out of the vehicle.

18. Raise the transmission slightly using a suitable transmission jack.

19. Remove the transmission crossmember.

20. Remove the oil filter, if necessary. Remove all bell housing bolts and remove the transmission from the vehicle.

To install:

21. Install the transmission securely on the transmission jack. Rotate the converter so it will align with the positioning of the flex plate.

22. Apply a coating of high temperature grease to the torque converter pilot hub.

23. Raise the transmission into place and push it forward until the dowels engage and the bell housing is flush with the block.

24. Install the oil filler tube. Install the bell housing bolts and torque to 30 ft. lbs. (41 Nm). Install the oil filter, if it was removed.

25. Install the transmission crossmember. Remove the engine support fixture and the transmission jack.

26. Install the torque converter bolts and torque to 23 ft. lbs. (31 Nm).

27. Connect the oil cooler lines.

28. Connect the throttle rod to the le-

ver and adjust if necessary.

29. Connect the gearshift rod and torque shaft assembly to the transmission and adjust if necessary.

30. Connect the wires to the neutral safety switch, and lockup solenoid, if equipped. Make sure all wires are routed correctly and clipped in place.

31. Install the torque converter inspection cover, starter and transmission struts.

32. Install the transfer case, if equipped.

33. Connect the distance sensor, if equipped.

34. Connect the the speedometer cable.

35. Install the driveshaft(s).

36. Install exhaust parts that were removed in order to remove the transmission.

37. Fill the transfer case, if equipped. Lower the vehicle.

38. Connect the negative battery cable.

39. Fill the transmission with the proper amount of Dexron®II.

40. Road test the vehicle, check for leaks and recheck the fluid level.

SHIFT LINKAGE ADJUSTMENT

NOTE: Do not attempt to adjust the linkage if any of the parts are excessively worn. If any rods are removed from the plastic grommets, new grommets should be installed. Pry only where the grommet and rod attach, not on the rod itself. Use pliers to snap the rod into the new grommet.

1. Shift the transmission into P.

2. Raise the vehicle and support safely.

3. Loosen the shift rod adjusting swivel lock screw. Make sure the swivel turns freely on the rod.

4. Make sure the valve body is in the PARK position by moving it all the way rearward.

5. Adjust the swivel position on the shift rod to obtain a free pin fit in the torque shaft lever. Tighten the lock screw.

6. If the vehicle starts in any gear other than P or N, or does not start in both P and N, then either the adjustment is wrong or another problem exists.

THROTTLE LINKAGE ADJUSTMENT

Except 5.9L Diesel Engine

1. If the vehicle is carbureted, perform the adjustment with the engine at normal operating temperature and off of the fast idle cam.

2. If the vehicle is fuel injected, retract the ISC actuator by doing one of the following:

a. If the DRBII is available, connect its connector to the diagnostic connector. Start the engine and place the DRBII in the "Throttle Body Minimum Air Flow Test" mode. Disconnect the electrical connector on the ISC actuator. Shut off the engine and disconnect the DRBII; the actuator is now fully retracted.

b. If the DRBII is not available, 2 jumper wires may be used. With the engine off, disconnect the connector to the ISC actuator. Connect a pair of jumper wires to the battery. Connect the negative jumper to the top pin of the ISC actuator and the positive jumper to the other pin. Do not leave the jumpers connected for more than 5 seconds. Disconnect the jumpers and the ISC actuator is fully retracted.

3. Raise the vehicle and support safely.

4. Loosen the adjustable swivel lock screw on the throttle rod enough so the rod travels freely in the swivel.

5. Hold the throttle lever firmly forward against its internal stop and tighten the lock screw. Lower the vehicle.

6. Reconnect the ISC actuator, if equipped.

7. If equipped with fuel injection, turn the ignition key to the RUN position for at least 5 seconds, but do not start the engine. Turn the key to the OFF position.

8. Start the engine and road test the vehicle.

THROTTLE CABLE ADJUSTMENT

5.9L Diesel Engine

1. Perform the adjustment with the engine at normal operating temperature.

2. While the throttle lever is seated against the low idle stop screw, the clearance between the actuation pin and the rear end of the slotted cable should be about $\frac{7}{32}$ in.

3. If it is not at specification, lift the locking pawl and slide the cable to the proper position to obtain the specified clearance.

4. Lock the pawl back into place and road test the vehicle.

Unlocking and locking the throttle cable pawl

TRANSFER CASE

Transfer Case Assembly

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Raise the vehicle and support safely.
3. Remove the skid plates, if equipped. Drain the transfer case fluid.
4. Disconnect the distance sensor, if equipped and disconnect the speedometer cable from the transfer case.
5. Matchmark and remove the driveshafts.
6. Disconnect the PTO, if equipped.
7. Disconnect the linkage, electrical connectors and vacuum lines from the transfer case. Using a suitable jack, support the transfer case, unbolt the transfer case from the transmission and slide it backwards to remove it from the vehicle.
8. The installation is the reversal of the removal procedure.

LINKAGE ADJUSTMENT

New Process 205

1. Shift the transfer case into neutral.
2. Move the shift rod boot upward for access.
3. Loosen the shift bracket bolts and move the bracket as far forward as possible. Tighten the bolts.
4. Check the smoothness of operation of the transfer case.

New Process 208 and 241

1. Move the transfer case shift lever boot aside for access to the shift lever and gate.
2. Move the shift lever into the 4H position. Make sure the lever is against the 4H gate.
3. Raise the vehicle and support safely.
4. Loosen the shift rod clamp screw until the shift rod is free to slide in the swivel.
5. Verify that the lever is in the 4H position and move it if it has moved out of position.
6. Tighten the clamp screw.
7. Check the smoothness of operation of the transfer case.

DRIVE AXLE

Rear Driveshaft

REMOVAL & INSTALLATION

One-Piece Driveshaft

1. Raise the vehicle and support safely.
2. Matchmark the driveshaft and the rear axle drive pinion gear shaft yoke.
3. Remove the rear U-joint attaching bolts and both strap clamps from the rear axle drive pinion gear shaft yoke.
4. Fluid may run from the rear of the extension housing or transfer case when the shaft is removed, so position a suitable drain pan under the area.
5. Remove the driveshaft from the transmission or transfer case.
6. The installation is the reversal of the removal procedure. Torque $\frac{1}{4}$ -28 clamp bolts to 14 ft. lbs. (19 Nm) and $\frac{5}{16}$ -24 to 25 ft. lbs. (34 Nm).

Two-Piece Driveshaft

1. Raise the vehicle and support safely.
2. Matchmark the driveshaft and the rear axle drive pinion gear shaft yoke.
3. Remove the rear U-joint attaching bolts and both strap clamps from the rear axle drive pinion gear shaft yoke.
4. Detach the protective boot clamp from the front shaft splines, if equipped and slide the rear shaft slip yoke from the front shaft at the center bearing. Remove the rear shaft from the vehicle.
5. Matchmark the yokes at the transmission or transfer case and remove the clamp retaining bolts and clamp straps.
6. Remove the center bearing retaining bolts and nuts and remove the front shaft with center bearing from the vehicle.
7. The installation is the reversal of the removal procedure. Torque $\frac{1}{4}$ -28 clamp bolts to 14 ft. lbs. (19 Nm) and $\frac{5}{16}$ -24 to 25 ft. lbs. (34 Nm).
8. Torque the center bearing bolts and nuts to 50 ft. lbs. (68 Nm).

Front Driveshaft

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.
2. Remove the skid plate, if equipped.
3. Matchmark the driveshaft and the front axle drive pinion gear shaft yoke.
4. Remove the CV joint to transfer case flange capscrews and lockwashers.
5. Remove the front U-joint attaching bolts and both strap clamps.
6. Remove the front driveshaft from the vehicle.
7. The installation is the reversal of the removal procedure. Torque the CV joint to transfer case flange capscrews to 25 ft. lbs. (34 Nm).
8. Torque $\frac{1}{4}$ -28 clamp bolts to 14 ft. lbs. (19 Nm) and $\frac{5}{16}$ -24 to 25 ft. lbs. (34 Nm).

Rear Driveshaft Center Bearing

REMOVAL & INSTALLATION

1. Remove the shafts and center bearing from the vehicle.

NOTE: Do not clamp the drive-shaft tube in a vise. Clamp only the forged portion of the welded yoke in a vise. Do not overtighten the vise jaws.

2. Clamp the front shaft in a vise and remove the bearing support and rubber insulator from the center bearing.

3. Bend the slinger away from the center bearing to provide sufficient clearance for installing a puller.

4. Remove the bearing from the front shaft with a suitable puller and remove the slinger. The replacement package contains the bearing, slinger and retainer.

5. The installation is the reversal of the removal procedure.

Single Cardan Universal Joint

REMOVAL & INSTALLATION

1. Remove the driveshaft and slip yoke, if equipped from the vehicle.

NOTE: Do not clamp the drive-

Single cardan universal joint components

U-joint removal and installation

shaft tube in a vise. Clamp only the forged portion of the welded yoke or the slip yoke in a vise. Do not overtighten the vise jaws.

2. Clamp the yoke in a vise and remove the bearing cap retainers.

3. Place a socket which has an inside diameter larger than the outside diameter of the bearing cap, against the yoke around the perimeter of the first cap to be removed. Place a socket which is slightly smaller than the cap, on the cap opposite the cap to be removed. Then position the yoke in a vise.

4. Compress the jaws until the smaller socket has driven the other cap into the larger socket.

5. Release the jaws and remove the cap that is partially out of the yoke.

6. Repeat the procedure for the remaining cap(s).

To install:

7. Clean and remove any rust from the yoke bores and lubricate lightly with suitable lithium based grease.

8. Position the spider cylinders in the yoke bores. Insert the seals into the yoke bores and against the spider cylinders. Tap the bearing caps into the yoke bores far enough to keep the spider in place.

9. Place the socket that is slightly smaller than the cap against the first cap and position the assembly in a vise. 10. Compress the jaws to force the bearing caps into the yoke bores far enough so the retainer grooves are visible.

11. Repeat the procedure for the remaining caps, if necessary.

12. Install the retaining clips.

13. Install the driveshaft assembly to the vehicle.

Double Cardan Constant Velocity Joint REMOVAL & INSTALLATION

1. Remove the front driveshaft from the vehicle.

2. Matchmark the yokes before disassembling so they will be installed in their original locations to retain driveshaft balance.

3. To expedite removal, remove the bearing caps in the sequence indicated.

4. Support the driveshaft horizontally and aligned with the base plate of the press. Shear the bearing cap plastic retaining ring and position the first link yoke rear arm over a 1½ in. socket. Place Spider Press Tool C-4365-1, or equivalent on the bearing caps in the flange yoke arms. Force the bearing cap out of the yoke with a press.

5. If the bearing cap is not completely removed, insert a suitable spac-

er between the spider and bearing cap and complete the removal.

6. Rotate the driveshaft 180° and repeat the procedure.

7. Disengage the spider trunnions from the link yoke. Pull the flange yoke and the spider from the centering ball on the ball support tube yoke.

8. To remove the ball socket, separate the CV joint between the link yoke and the flange yoke by forcing the spider trunnion bushing from the link yoke. Pull the flange yoke and the spider with the ball socket from the centering ball as an assembly.

9. Pry the seal from the ball socket and remove the washers, spring and 3 ball seats.

10. Remove the centering ball from the ball socket using Tool set C-4365.

To install:

11. Install the centering ball in the socket using special tool C-4365-3. Force the ball into the socket until it is seated firmly against the shoulder at the base of the socket.

12. To install the spider, insert one bearing cap partially into one of the yoke bores and then rotate the yoke 180°. Insert the spider into the yoke bore and seat the spider trunnion in the bearing cap. Partially insert the

opposite bearing cap in the remaining yoke bore.

13. Force the bearing caps inward while pivoting the spider back and forth to provide free movement of the trunnions in the bearing.

14. When the retainer grooves become visible, install the retainer.

15. Continue to force the caps inward until the opposite retainer can be installed in its groove.

16. Lubricate the centering ball and socket with the lubricant provided in the replacement kit.

17. Repeat the installation procedure with the remaining portion of the assembly.

Front Axle Shaft, Hub, Bearing and Seal

REMOVAL & INSTALLATION

Model 44-8FD—Right Side Shaft

1. Raise the vehicle and support safely.

2. Remove the wheel and remove the brake caliper from the rotor. Do not allow the caliper to hang by the hose.

Bearing cap removal sequence

Double cardan joint components

3. Remove the dust cap and driving hub snapping.

4. Remove the driving hub and retaining ring.

5. Remove the wheel bearing nut lock using tool C-4170-A, or equivalent. Remove the retaining washer and the wheel bearing adjusting nut.

6. Remove the rotor/hub with wheel bearings and retainer spring plate. Remove the grease seal and bearing from the rotor.

7. Remove the splash shield and spindle from the steering knuckle..

8. Remove the brake caliper adaptor from the knuckle.

9. Remove the axle shaft from the axle housing. Remove the seal and stone guard from the shaft.

To install:

10. Install the seal on the axle shaft stone shield with the lip facing toward the axle shaft splines.

11. Insert the axle assembly into the axle housing making sure not to damage the differential seal.

12. Install the brake caliper adaptor to the knuckle. Install the spindle and splash shield and torque the nuts to 30 ft. lbs. (41 Nm).

13. Lubricate and install the inner wheel bearing in the rotor and install a new seal.

14. Install the assembly to the spindle. Install the adjusting nut and tighten it with 50 ft. lbs. (68 Nm) of torque. Loosen the nut and tighten with 35 ft. lbs. (48 Nm) of torque. Loosen the adjusting nut about $\frac{3}{4}$ turn. Position the retaining washer on the adjusting nut by rotating the nut so that the alignment pin pressed into the nut will enter the nearest hole in the retaining washer. Install and tighten the nut

lock with 50 ft. lbs. (68 Nm) of torque. The final bearing endplay should be 0.001-0.010 in.

15. Install the retaining spring, driving hub and retaining ring.

16. Apply sealant to the edge of the dust cap and install.

17. Install the brake components and wheel.

18. Road test the vehicle and check for leaks.

Model 44-8FD—Left Side Shaft

1. Raise the vehicle and support safely.

2. Remove the wheel and remove the brake caliper from the rotor. Do not allow the caliper to hang by the hose.

3. Remove the dust cap and driving hub snapping.

4. Remove the driving hub and retaining ring.

5. Remove the wheel bearing nut lock using tool C-4170-A, or equivalent. Remove the retaining washer and the wheel bearing adjusting nut.

6. Remove the rotor/hub with wheel bearings and retainer spring plate. Remove the grease seal and bearing from the rotor.

7. Remove the splash shield and spindle from the steering knuckle..

8. Remove the brake caliper adaptor from the knuckle.

9. Disconnect the vacuum hoses and electrical connector from the disconnect housing assembly.

10. Remove the disconnect housing assembly cover and shield.

11. Remove the intermediate axle shaft from the axle tube.

12. Remove the shift collar from the disconnect housing.

13. Remove the inner axle shaft seal from the axle tube and remove from the housing. If the vehicle is equipped with a seal guard, discard it; the guard is not used with the replacement seal.

14. Remove the front differential cover.

15. Force the inner axle shaft toward the center of the vehicle and remove the C-lock from the recessed groove in the shaft.

16. Remove the inner axle shaft using tools D-354-4 and D-354-3, or equivalent.

To install:

17. Install the inner axle shaft using D-354-4 and D-354-2, or equivalent. Slide the axle shaft into the side gear and install the C-lock in the groove.

18. Install the replacement seal using the proper replacing tools.

19. Install the shift collar on the splined end of the inner axle shaft.

20. Install the intermediate axle shaft through the axle tube.

21. Install the disconnect housing assembly cover. Make sure the shift fork is properly guided into the shift collar groove. Install the shield.

22. Connect the vacuum hoses and electrical connector to the diaphragm and switch on the disconnect housing assembly.

23. Install the brake caliper adaptor to the knuckle. Install the spindle and splash shield and torque the nuts to 30 ft. lbs. (41 Nm).

24. Lubricate and install the inner wheel bearing in the rotor and install a new seal.

25. Install the assembly to the spindle. Install the adjusting nut and tighten it with 50 ft. lbs. (68 Nm) of torque. Loosen the nut and tighten with 35 ft.

Model 44-8FD left side front axle

Removing the lock screw

Removing the C-clip lock

lbs. (48 Nm) of torque. Loosen the adjusting nut about $\frac{3}{4}$ turn. Position the retaining washer on the adjusting nut by rotating the nut so that the alignment pin pressed into the nut will enter the nearest hole in the retaining washer. Install and tighten the nut lock with 50 ft. lbs. (68 Nm) of torque. The final bearing endplay should be 0.001–0.010 in.

26. Install the retaining spring, driving hub and retaining ring.

27. Apply sealant to the edge of the dust cap and install.

28. Install the brake components and wheel.

29. Road test the vehicle and check for leaks.

Dana 60

1. Raise the vehicle and support safely.

2. Remove the wheel and remove the brake caliper and pads from the rotor. Do not allow the caliper to hang by

the hose.

3. Turn the shift knob to the **ENGAGE** position.

4. Apply pressure to the face of the shift knob and remove the 3 retaining screws located nearest to the flange. Pull outward and remove the shift knob from the base.

5. Remove the snapping from the axle shaft.

6. Remove the capscrews and lockwashers from the base flange.

7. Remove the locking hub from the rotor/hub. Remove and discard the gasket.

8. Straighten the lock ring tangs and use tool DD-1241-JD, or equivalent to remove the outer locknut and the lock ring. Remove the inner locknut and the outer wheel bearing.

9. Remove the rotor/hub with the inner wheel bearing. Remove the grease seal and bearing from the rotor.

10. Remove the splash shield, caliper adaptor and spindle from the steering

knuckle.

11. Slide the inner and outer axle shafts with the bronze spacer, seal and slinger from the axle shaft tube and the steering knuckle.

To install:

12. Position the bronze spacer on the axle shaft with the chamfer facing the U-joint. Slide the axle shaft into the steering knuckle and the axle shaft tube.

13. Install the spindle, the brake adaptor and the splash shield. Torque the nuts to 65 ft. lbs. (86 Nm). Position the inner pad on the adaptor.

14. Lubricate and install the inner wheel bearing in the rotor and install a new seal. Install the rotor to the spindle. Install the outer wheel bearing and inner locknut.

15. Install the locknut nut and tighten it with 50 ft. lbs. (68 Nm) of torque. Loosen the nut and tighten with 35 ft. lbs. (48 Nm) of torque. Loosen the adjusting nut about $\frac{3}{4}$ turn. Install the lock ring and outer locknut. Install and tighten the nut lock with 65 ft. lbs. (88 Nm) of torque. Bend one tang over each of the locknuts. The final bearing endplay should be 0.001–0.010 in.

16. Install a new gasket on the hub. Install the drive flange and torque the nuts to 35 ft. lbs. (48 Nm). Install the snapping.

17. Position the locking hub shift knob on its base. Align the splines by pushing inward on the shift knob and rotating it clockwise to lock it in place.

18. Install and tighten the 3 screws.

19. Install the brake components and wheel.

20. Road test the vehicle and check for leaks.

Rear Axle Shaft, Bearing and Seal

REMOVAL & INSTALLATION

Chrysler 8 $\frac{3}{8}$ in. and 9 $\frac{1}{4}$ in.

1. Raise the vehicle and support safely.

2. Remove the wheel and brake drum.

3. Remove the differential housing cover.

4. Rotate the differential case as required to expose the lock screw and remove it. Remove the pinion mate gear shaft from the case.

5. Force the axle shaft toward the center of the vehicle and remove the axle shaft C-clip lock from the recessed groove in the axle shaft.

6. Remove the axle shaft from the axle housing.

7. Pry the axle shaft seal from the end of the axle tube using a suitable pry bar.

8. To remove the bearing from an

8 $\frac{3}{8}$ in. rear, use removal tool C-637 attached to a suitable slide hammer. To remove the bearing from an 9 $\frac{1}{4}$ in. rear, use removal tool C-4828 attached to a suitable slide hammer.

To install:

9. Clean the bearing bore in the axle tube.

10. Insert the new axle shaft bearing onto the pilot of tool C-4198 for 8 $\frac{3}{8}$ in. rear or tool C-4826 for 9 $\frac{1}{4}$ in. rear. The bearing is fully installed when it is seated firmly against the shoulder in the axle tube.

11. Install the new seal to the axle tube.

12. Lubricate the bearing bore and seal lip with grease and insert the axle shaft into the axle tube engaging its splines with the differential side gear splines.

13. Install the C-clip lock in the groove at the end of the shaft. Force the shaft outward to seat the C-clip.

14. Insert the differential pinion gear mate shaft into the case and through the thrust washers and pinion gears. Align the hole in the shaft with the lock screw hole in the differential case and install the lock screw. Torque the screw to 14 ft. lbs. (19 Nm).

15. Thoroughly clean and dry the case cover, mating surface, bolts and bolt holes. Apply silicone sealer to the cover and install.

16. Install the drum and wheel.

17. Fill the differential with the proper lubricant.

18. Road test the vehicle and check for leaks.

Model 60, 60M and 70

1. Raise the vehicle and support safely.

2. Remove the axle flange bolts.

3. Remove the axle shaft.

4. Remove the nut lock and remove the special adjustment nut.

5. Remove the outer bearing, brake drum and inner bearing. Remove the inner seal from the drum.

To install:

6. Lubricate and install the inner bearing to the drum and install a new seal.

7. Install the drum to the axle housing. Install the outer bearing to the drum.

8. Tighten the adjustment nut with 130 ft. lbs. (175 Nm) while rotating the wheel.

9. Loosen the adjustment nut one-third of a turn to provide about 0.005 in. of bearing endplay. Install the nut lock.

10. Install the axle with a new flange gasket.

11. Install the axle flange bolts and torque to 70 ft. lbs. (95 Nm).

Pinion Seal

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.

2. Matchmark and remove the driveshaft.

3. Remove the rear wheel and brake drums to prevent any drag.

4. Using an inch lb. torque wrench, measure the pinion bearing preload. Read the torque while the handle of the wrench is moving through several complete revolutions.

5. Using the proper tools, hold the companion flange and remove the drive pinion nut and washer.

6. Remove the companion flange using tool C-452, or equivalent. Lower the rear of the vehicle to prevent fluid loss.

7. Using a seal remover tool, remove the seal from the carrier and clean the seal seat.

To install:

8. The outside diameter of the seal is precoated with a special sealer so no sealing compound is required for installing. The seal is properly installed when the flange contacts the housing flange face.

9. Install the companion flange and the washer with the convex side out.

10. For 8 $\frac{3}{8}$ and 9 $\frac{1}{4}$ rears, tighten the pinion nut to 210 ft. lbs. (285 Nm) and check the pinion bearing preload. If the preload is less than the original preload measured, continue tightening the nut in very small increments until the proper preload is reached.

11. For 60, 60M and 70 rears, torque the pinion nut to 260 ft. lbs. (350 Nm).

12. Install the driveshaft, drums and rear wheels.

13. Refill the differential with the proper lubricant.

14. Road test the vehicle.

Differential Case

REMOVAL & INSTALLATION

Chrysler 8 $\frac{3}{8}$ in. and 9 $\frac{1}{4}$ in.

1. Raise the vehicle and support safely.

2. Remove the wheels and the brake drums.

3. Remove the housing cover and drain the lubricant.

4. Remove the rear wheel anti-lock brake sensor, if equipped.

5. Remove both axle shafts.

6. Matchmark the bearing caps to the differential housing.

7. Remove the differential bearing threaded adjuster lock from each cap.

8. Loosen but do not remove the bearing caps.

9. Loosen the side adjusters using tool C-4164.

10. Remove the bearing caps, the threaded adjusters and the differential case.

To install:

11. Position the assembled differential case in the housing.

12. Install the bearing caps in their original positions according to the matchmarks made during the disassembly.

13. Torque the upper bolts to 10 ft. lbs. (14 Nm) and finger tighten the bottom bolts.

14. Tighten the side adjusters until the proper side play specifications are reached.

15. Torque the bearing caps bolts to 70 ft. lbs. (95 Nm) for 8 $\frac{3}{8}$ in. rears or 100 ft. lbs. (136 Nm) for 9 $\frac{1}{4}$ in. rears.

16. Install both axle shafts.

17. Install the rear wheel anti-lock brake sensor, if equipped.

18. Install the housing cover and fill with the proper lubricant.

19. Install the drums and wheels.

20. Road test the vehicle.

Model 60, 60M and 70

1. Raise the vehicle and support safely.

2. Remove both axle shafts. Remove the wheels and the brake drums.

3. Remove the housing cover and drain the lubricant.

4. Remove the rear wheel anti-lock brake sensor, if equipped.

5. Matchmark the bearing caps to the differential housing.

6. Remove the bearing caps.

7. Position a suitable housing spreader in the housing with the dowels seated securely in the locating holes.

8. Spread the case no more than 0.015 in. (0.38mm).

9. Remove the differential case from the housing using a small prying tool, if necessary.

10. Spread the housing and install the assembled case.

11. Install the bearing caps in their original positions according to the matchmarks made during the disassembly.

12. Torque the cap bolts to 85 ft. lbs. (115 Nm).

13. Check and adjust all measurements to specifications.

14. Install the rear wheel anti-lock brake sensor, if equipped.

15. Install the housing cover and fill with the proper lubricant, including suitable hypoid gear lubricant if the differential is a TraC-Lok.

16. Install the drums and wheels.

17. Install both axle shafts.

18. Road test the vehicle.

Axle Housing

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Raise vehicle and support safely.
2. Remove the rear wheel anti-lock brake sensor, if equipped.
3. Remove the rear wheels.
4. Disconnect the brake hose at the T-fitting.
5. Disconnect the parking brake cables.
6. Remove the driveshaft.
7. Support the weight of the assembly with the proper equipment. Disconnect the shock absorbers and remove the leaf spring nuts and U-bolts.
8. Remove the assembly from vehicle.
9. The installation is the reversal of the removal procedure.

STEERING

Steering Wheel

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the horn pad.
3. Remove the steering wheel hold-down nut. Matchmark the steering wheel to the shaft.
4. Using a suitable steering wheel puller, pull the steering wheel off of the shaft.
5. The installation is the reversal of the removal procedure.

Manual Steering Gear

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the 2 bolts from the wormshaft to steering shaft coupler.
3. Raise the vehicle and support safely.
4. Matchmark and remove the pitman arm from the pitman shaft using tool C-4150, or equivalent.
5. Remove the steering gear mounting bolts and remove the gear from the vehicle.
6. The installation is the reversal of the removal procedure. Torque the pitman arm nut to 175 ft. lbs. (237 Nm).

Wormshaft Preload Torque Adjustment

1. Raise the vehicle and support safely.

2. Remove the pitman from the pitman shaft.

3. Remove the horn pad.

4. Loosen the sector shaft adjusting screw locknut and back off the adjusting screw about 1½ turns.

5. Turn the steering wheel to the right stop and then back ½ turn. Measure the torque required to turn the steering while back to the straight ahead position. The specification is 4–6 inch lbs.

6. If not within specifications, loosen the large adjustment cap locknut and turn the adjustment cap until the proper preload is reached. Turning the adjuster clockwise increases the preload torque.

7. Tighten the locknut and recheck the preload.

8. Tighten the sector shaft adjuster screw locknut.

SECTOR SHAFT ADJUSTMENT

1. Perform the wormshaft preload procedure.

2. Center the steering wheel.

3. Loosen the sector shaft adjuster screw locknut and screw the adjuster screw all the way down. Tighten the locknut.

4. Rotate the steering wheel ¼ turn away from the overcenter position. Measure the torque required to rotate the wheel over the overcenter position. The specification is 14 inch lbs.

5. If not within specifications, adjust the screw accordingly and tighten the locknut.

6. Install the horn pad.

7. Install the pitman arm.

Power Steering Gear

REMOVAL & INSTALLATION

1. Place the wheels in the straight ahead position.

2. Remove the windshield washer solvent reservoir and the coolant overflow tank, if necessary.

3. Position a drain pan under the steering gear.

4. Disconnect the fluid hoses from the gear and plug them.

5. Raise the vehicle and support safely. Matchmark and remove the pitman arm.

6. Disconnect the steering column shaft from the stub shaft.

7. Remove the retaining bolts and remove the steering gear from the vehicle.

8. The installation is the reversal of the removal procedure. Torque the pitman arm nut to 175 ft. lbs. (237 Nm).

ADJUSTMENT

1. If the vehicle wanders of the steering has too much play, the sector shaft can be adjusted.

2. Loosen the adjusting screw locknut and turn the screw all the down.

3. Back the screw off ¼–½ turn.

4. Tighten the locknut.

5. Road test the vehicle. If the steering wheel does not return easily after a turn, back the screw off until the wheel returns easily.

Power Steering Pump

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Position a drain pan under the power steering pump.

3. Disconnect the fluid hoses from the pump and plug them.

4. Remove the front bracket attaching bolts and remove the belt from the pulley.

3. Remove the rear pump to bracket nut and remove the pump.

4. Remove the bracket from the pump.

5. Remove the pulley from the pump with the proper puller. Install the pulley on the new pump using the special installation tools.

6. The installation is the reversal of the removal procedure.

BELT ADJUSTMENT

1. Loosen the bracket mounting bolts.

2. Using a ½ in. drive breaker bar in the square hole provided in the bracket, move the pump away from the engine. Do not pry against the fluid reservoir.

3. With the pump moved enough so that the belt deflects about ¼–½ in. under a 10 lb. load, tighten the bolts.

SYSTEM BLEEDING

1. Fill the reservoir with power steering fluid.

2. Turn the wheels to the full left turn position and add fluid until the reservoir is full.

3. Start the engine and add fluid to bring the level to the correct level.

4. To purge the system of air, turn the steering wheel from side to side without contacting the stops.

5. Return the wheel to the straight ahead position and operate the engine for 2 minutes before road testing. This should bleed the system completely.

Tie Rod Ends REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.
2. Remove the cotter pin and nut from the tie rod end.

3. Using a suitable puller, remove the tie rod from the steering knuckle of center link.

4. Loosen the sleeve clamp nut and bolt and unscrew the tie rod end from the sleeve.

5. The installation is the reversal of the removal procedure. Torque the

stud nuts to 45 ft. lbs. (61 Nm) and install a new cotter pin.

6. Perform a front end alignment as required.

Exploded view of the manual steering gear

BRAKES

For all brake system repair and service procedure not detailed below, please refer to "Brakes" in the Unit Repair section.

Master Cylinder

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Disconnect and plug the brake lines from the master cylinder.
3. Remove the nuts attaching the master cylinder to the power booster.
4. Remove the master cylinder from the mounting studs.

To install:

4. Bench bleed the master cylinder.
5. Install to the studs and install the nuts.
6. Install the brake lines to the master cylinder.

Combination Valve

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Raise the vehicle and support safely.
3. Tag and disconnect the brake

Removing the tie rod end

lines from the valve.

4. Disconnect the wires to the pressure switch.
5. Remove the combination valve from the frame bracket.
6. The installation is the reversal of the removal procedure.
7. Bleed the brakes in the following order:
 - a. Rear Wheel Anti-Lock valve
 - b. Right rear wheel cylinder
 - c. Left rear wheel cylinder
 - d. Right front caliper
 - e. Left front caliper

Power Brake Booster

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Disconnect the vacuum hose(s) from the booster.
2. Remove the nuts attaching the master cylinder to the booster and move the master cylinder to the side.
3. From inside of the vehicle, remove the clip that secures the booster pushrod to the brake pedal.
4. Remove the nuts that attach the booster to the dash panel and remove it from the vehicle.
5. Transfer the check valve to the new booster.
6. The installation is the reversal of the removal procedure.

Brake Caliper

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely. Remove the tire and wheel assembly.
2. Remove the caliper retaining clips and anti-rattle springs.
3. Lift the caliper off of the rotor. Remove the outer pad from the caliper.
4. Remove the brake hose retaining bolt from the caliper.

To install:

5. Install the brake hose to the caliper using new copper washers.
6. Adjust the ears of the outer pad to provide a tight fit in the caliper recesses.
7. Position the caliper over the rotor so the caliper engages the adaptor correctly.
8. Install the anti-rattle springs and retaining clips.
9. Fill the master cylinder and bleed the brakes.

Disc Brake Pads

REMOVAL & INSTALLATION

1. Remove some of the fluid from the master cylinder. Raise the vehicle and support safely. Remove the tire and wheel assemblies.
2. Remove the caliper and remove the outer pad from the caliper.
3. Remove the inner pad from the adaptor.

To install:

4. Use a large C-clamp to compress the piston back into the caliper bore.
5. Adjust the ears of the outer pad to provide a tight fit in the caliper recesses.
6. Install the inner pad to the adaptor.
7. Position the caliper over the rotor so the caliper engages the adaptor correctly.
8. Install the anti-rattle springs and retaining clips.
9. Refill the master cylinder.

Brake Rotor

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.
2. Remove the wheel.
3. Remove the caliper and disc brake pads.
4. Remove the dust cap.
5. Remove the cotter pin, castellated nut lock, wheel bearing nut and washer from the spindle.
6. Remove the outer wheel bearing.
7. Remove the rotor with the inner wheel bearing from the spindle. Remove the grease seal.

To install:

8. Lubricate and install the inner wheel bearing. Install a new grease seal.
9. Install the rotor to the spindle.
10. Lubricate and install the outer wheel bearing, washer and nut. When the bearing preload is properly set, install the nut lock and a new cotter pin.
11. Install the grease cap.
12. Install the brake pads and caliper.
13. Install the wheel.

Brake Drums

REMOVAL & INSTALLATION

Except Dana Axle

1. Raise the vehicle and support safely.
2. Remove the wheel.
3. Remove the factory clips from the wheel studs, if equipped.
4. Remove the drum. If the drum is difficult to remove, remove the plug from the rear of the backing plate and push the self adjuster lever away from the star wheel. Rotate the star wheel to retract the shoes.
5. The installation is the reversal of the removal procedure.

Dana Axle

1. Raise the vehicle and support safely.
2. Remove the axle shafts.

3. Remove the bearing adjuster nut and the outer bearing.
4. Remove the drum. If the drum is difficult to remove, remove the plug from the rear of the backing plate and push the self adjuster lever away from the star wheel. Rotate the star wheel to retract the shoes.
5. The installation is the reversal of the removal procedure.

Brake Shoes

REMOVAL & INSTALLATION

11 Inch Brake Drum

1. Raise the vehicle and support safely. Remove the wheels and drums. Remove the primary and secondary shoe return springs from the anchor pin.
2. Lift the adjuster lever and disconnect the actuator cable.
3. Remove the shoe retainers and springs.
4. Remove the shoes (held together by the lower spring) while separating the parking brake actuating lever from the shoe with a twisting motion.

To install:

5. Thoroughly clean and dry the backing plate. To prepare the backing plate, lubricate the bosses, anchor pin and parking brake actuating lever pivot surface lightly with lithium based grease.
6. Remove, clean and dry all parts still on the old shoes. Lubricate the star wheel shaft threads with anti-sieze lubricant and transfer all parts to their proper locations on the new shoes.
7. Spread the shoes apart, engage the parking brake lever and position them on the backing plate so the wheel cylinder pins engage and the anchor pins hold the shoes.
8. Install the parking brake strut and hold-down spring assemblies.
9. Install the anchor plate. Lubricate the sliding surface of the actuator cable plate lightly and install the cable.
10. Install the shoe return spring opposite the cable, then install the remaining cable.
11. Adjust the star wheel.
12. Remove any grease from the linings and install the drum.
13. Complete the brake adjustment with the wheels installed.

12 Inch Brake Drum

1. Raise the vehicle and support safely. Remove the axles and drums.
2. Unhook the adjuster lever return spring from the lever.
3. Remove the lever and return spring from the lever pin.
4. Unhook the adjuster cable from the lever.

11 in. drum brakes

5. Remove the upper shoe to shoe spring.
6. Remove the shoe hold-down springs.
7. Disconnect the parking brake cable from the parking brake lever.
8. Remove both brake shoes, the lower spring and star wheel assembly.

To install:

9. Thoroughly clean and dry the backing plate. To prepare the backing plate, lubricate the bosses, anchor pin and parking brake actuating lever pivot surface lightly with lithium based grease.
10. Remove, clean and dry all parts still on the old shoes. Lubricate the star wheel shaft threads with anti-sieze lubricant and transfer all parts to their proper locations on the new shoes. Install the assemblies to the backing plate.
11. Install the shoe hold-down springs and pins.
12. Connect the parking brake cable to the lever.
13. Install the upper spring.
14. Position the adjuster lever return spring on the pin. Install the adjuster lever and attach the cable.
15. Adjust the star wheel.
16. Remove any grease from the linings and install the drum.
17. Complete the brake adjustment with the wheels (but not the axles) installed.
18. Install the axles.

Wheel Cylinder

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.
2. Remove the wheel, drum and brake shoes.
3. If equipped with a 12 in. drum, remove the anchor bolt and nut, washer, spring, parking brake lever, adjuster cable, cam plate and anchor spring bushing.
4. Remove the brake line from the wheel cylinder.
5. Remove the wheel cylinder bolts and remove the cylinder from the backing plate.
6. The installation is the reversal of the removal procedure.

Front Parking Brake Cable

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.
2. Remove the front cable adjusting nut.
3. Remove the clip securing the cable to the anchor bracket and slide the cable out of the bracket.
4. Remove the retainer attaching the cable to the pedal assembly frame. Disengage the cable from the pedal

12 in. drum brakes

clevis.

5. Remove the cable grommet from the floor pan and remove the cable.

6. The installation is the reversal of the removal procedure.

Rear Parking Brake Cable

REMOVAL & INSTALLATION

1. Release the parking brakes fully.
2. Raise the vehicle and support safely.

3. Remove the adjusting nut from the front cable.

4. Remove the brake drums. Remove the shoes, if necessary. Disconnect the cable from the lever and compress the cable retainer tabs and remove the cable from the backing plate.

5. Remove the cable from the equalizer and ratio lever.

6. The installation is the reversal of the removal procedure.

ADJUSTMENT

1. Release the parking brakes fully.

2. Raise the vehicle and support safely.

3. Adjust the rear brakes.

4. Loosen the nut on the front cable until there is slack in all the cables.

5. Rotate the rear wheels and tighten the cable adjusting nut until there is a slight drag at the wheels.

6. Continue to rotate the rear wheels and loosen the nut until all drag is eliminated.

7. Back off the nut an additional 2 turns.

8. Apply and release the parking brake several times. Upon the least release, verify that there is no drag at the wheels.

9. To check the operation, make sure the parking brake holds on an incline.

FRONT SUSPENSION

Shock Absorbers

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.

2. On 2 wheel drive vehicles, remove the upper shock nut, washer and bushing. Remove the lower mounting bolts and remove the shock from the vehicle.

3. On 4WD vehicles, remove the upper mounting nut, lower mounting stud and retainers. Remove the shock from the vehicle.

4. The installation is the reversal of the removal procedure.

Coil Springs

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.
2. Remove the shock absorber.
3. Remove the strut bar and disconnect the sway bar from the lower control arm, if equipped.
4. Install spring compressor tool DD-1278, or equivalent to the coil spring and tighten the nut finger tight, then back off half a turn.
5. Remove the cotter pin and lower ball joint nut.
6. Release the lower ball joint taper using ball stud loosening tool C-3564-A, or equivalent.
7. Remove the tool and remove the ball stud from the control arm. Release the compressor tool from the coil spring.
8. Pull the arm down and remove the spring with the rubber isolation pad from the vehicle.

To install:

9. Install the spring with the rubber isolators. Install the compressor tool and compress it enough so the lower ball joint can be inserted through the knuckle.
10. Torque $11\frac{1}{16}$ –16 lower ball joint nuts to 135 ft. lbs. (183 Nm). Torque $\frac{3}{4}$ –16 nuts to 175 ft. lbs. (237 Nm). Install a new cotter pin. Remove the spring compressor.
11. Install the strut bar and connect the sway bar from the lower control arm, if equipped.
12. Install the shock absorber.

Leaf Springs

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.
2. Using the proper equipment, support the weight of the front axle.
3. Remove the nuts, washers and U-bolts attaching the springs to the axle housing. Remove the spring pad.
4. Remove the spring shackle bolts, shackle and spring front bolt.
5. Remove the spring from the vehicle.
6. The installation is the reversal of the removal procedure. Torque the U-bolt nuts to 110 ft. lbs. (149 Nm).

Upper Ball Joint

INSPECTION

To inspect the ball joints, unload the suspension. Upper ball joints on 2WD vehicles and any ball joint on 4WD vehicles should be replaced if any play exists at all.

REMOVAL & INSTALLATION

2wd Vehicles

1. Raise the vehicle and support safely.
2. Position a support at the outer end of the lower control arm and lower the vehicle so that the support compresses the coil spring.
3. Remove the tire and wheel assembly.
4. Release the upper ball joint taper using ball stud loosening tool C-3564-A, or equivalent.
5. Unthread the ball joint from the control arm with tool C-3561, or equivalent.
6. The installation is the reversal of the removal procedure. Torque the ball joint itself to 125 ft. lbs. (169 Nm).
7. Torque the upper ball stud nut to 135 ft. lbs (183 Nm).

4wd Vehicles

1. Raise the vehicle and support safely.
2. Remove the front axle shaft.
3. Disconnect the tie rod end from the steering knuckle. On the left side, disconnect the drag link ball stud from the steering knuckle.
4. On the left side, remove the nuts and washers from the steering knuckle arm and remove the arm and spring, if equipped, from the knuckle.
5. If equipped with a Model 44 front axle, remove the ball joint nuts and discard the lower nut. Use a brass drift and hammer to separate the steering knuckle from the axle tube yoke. Use tool C-4169 to remove the sleeve from the upper yoke arm.
6. Remove the snapping from the ball joint. Install the knuckle in a vise and use tools D-150-1, D-150-3 and C-4212-L to remove the ball joint from the knuckle.
7. If equipped with a Dana 60 front axle, remove the bolts from the knuckle lower cap. Dislodge the cap from the steering knuckle and axle tube yoke. Remove the steering knuckle. Use tool D-192 to remove the upper socket pin from the axle tube upper arm bore. Remove the seal.

To install:

8. If equipped with a Model 44, use tools C-4212-L and C-4288 to force the upper ball joint into the steering knuckle. Install the snapping and install a new rubber boot. Thread the replacement sleeve into the upper yoke bore so that 2 threads are exposed at the top of the yoke. Position the knuckle on the axle tube yoke and install a new lower ball stud nut. Torque to 80 ft. lbs. (108 Nm). Using the special socket, torque the sleeve to 40 ft. lbs. (54 Nm). Install the upper ball stud nut and torque to 100 ft. lbs. (136

Nm) and install a new cotter pin.

9. If equipped with a Dana 60 front axle, use tool D-192 to install the upper socket pin to the axle tube upper arm bore. Install a new seal. Torque to 500–600 ft. lbs. (668–813 Nm). Position the knuckle over the socket pin. Fill the lower socket cavity with grease. Install the lower cap and torque the bolts to 80 ft. lbs. (110 Nm).

10. On the left side, install the spring, if equipped and the steering knuckle arm to the steering knuckle.

11. Connect the tie rod to the end of the steering knuckle. On the left side, connect the drag link ball stud to the steering knuckle.

12. Install the front axle shaft and all related components.

Lower Ball Joint

INSPECTION

To inspect the ball joints, unload the suspension. Lower ball joints on 2WD vehicles should be replaced if they have more than 0.020 in. play. Any ball joint on 4WD vehicles should be replaced if any play exists.

REMOVAL & INSTALLATION

2wd Vehicles

1. Raise the vehicle and support safely.
2. Remove the shock absorber.
3. Remove the strut bar and disconnect the sway bar from the lower control arm, if equipped.
4. Install spring compressor tool DD-1278, or equivalent to the coil spring and tighten the nut finger tight, then back off half a turn.
5. Remove the cotter pin and lower ball joint nut.
6. Release the lower ball joint taper using ball stud loosening tool C-3564-A, or equivalent.
7. Remove the tool and remove the ball stud from the control arm. Release the compressor tool from the coil spring.
8. Pull the arm down and remove the spring with the rubber isolation pad from the vehicle. Remove the ball joint boot. Use tool C-4212, or an appropriate ball joint press to remove the ball joint from the arm.

To install:

9. Use the remover tool to press the ball joint into the arm. Install a new rubber boot. Install the spring with the rubber isolators. Install the compressor tool and compress it enough so the lower ball joint can be inserted through the knuckle.

10. Torque $11\frac{1}{16}$ –16 lower ball joint nuts to 135 ft. lbs. (183 Nm). Torque $\frac{3}{4}$ –16 nuts to 175 ft. lbs. (237 Nm).

Removing the upper ball joint from the knuckle

Removing or installing the upper socket pin

Install a new cotter pin. Remove the spring compressor.

11. Install the strut bar and connect the sway bar from the lower control arm, if equipped.

12. Install the shock absorber.

4wd Vehicles

1. Raise the vehicle and support safely.

2. Remove the front axle shaft.

3. Disconnect the tie rod end from the steering knuckle. On the left side, disconnect the drag link ball stud from the steering knuckle.

4. On the left side, remove the nuts

and washers from the steering knuckle arm and remove the arm and spring, if equipped, from the knuckle.

5. If equipped with a Model 44 front axle, remove the ball joint nuts and discard the lower nut. Use a brass drift and hammer to separate the steering knuckle from the axle tube yoke.

6. Remove the snapping from the ball joint. Install the knuckle in a vise and use tools D-150-1, D-150-3 and C-4212-L to remove the ball joint from the knuckle.

7. If equipped with a Dana 60 front axle, use tools C-4212-L, C-4366-1 and C-4366-2 to remove the lower ball

joint.

To install:

8. If equipped with a Model 44, use tools C-4212-L and C-4288 to force the lower ball joint into the steering knuckle. Install the snapping and install a new rubber boot. Position the knuckle on the axle tube yoke and install a new lower ball stud nut. Torque to 80 ft. lbs. (108 Nm). Install the upper ball stud nut and torque to 100 ft. lbs. (136 Nm) and install a new cotter pin.

9. If equipped with a Dana 60 front axle, use tools C-4212-L, C-4366-3 and C-4366-4 to install the seal and lower bearing cup into the axle tube yoke lower bore. Reposition the tools and install the lower bearing and seal into the bore. Position the knuckle over the socket pin. Fill the lower socket cavity with grease. Install the lower cap and torque the bolts to 80 ft. lbs. (110 Nm).

10. On the left side, install the spring, if equipped and the steering knuckle arm to the steering knuckle.

11. Connect the tie rod to the end of the steering knuckle. On the left side, connect the drag link ball stud to the steering knuckle.

12. Install the front axle shaft and all related components.

Upper Control Arm

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.

2. Remove the shock absorber.

3. Remove the strut bar and disconnect the sway bar from the lower control arm, if equipped.

4. Install spring compressor tool DD-1278, or equivalent to the coil spring and tighten the nut finger tight, then back off half a turn.

5. Remove the cotter pin and upper ball joint nut. Suspend the rotor assembly with a wire so there is not excessive pull on the brake hose.

6. Release the upper ball joint taper using ball stud loosening tool C-3564-A, or equivalent.

7. Remove the tool and remove the ball stud from the control arm.

8. Remove the pivot bar retaining bolts on Vans or the cam bolt assemblies on Pick-Up and Ramcharger and remove the arm from the vehicle.

To install:

9. Install the arm to the frame rail bracket and install the retaining bolts.

10. Torque the ball joint nut to 135 ft. lbs. (183 Nm). Install a new cotter pin. Remove the spring compressor.

11. Install the strut bar and connect the sway bar from the lower control arm, if equipped.

Upper control arm—Van

Upper control arm and related components—2 wheel drive Pick-Up and Ramcharger

12. Install the shock absorber.
13. Align the front end. When all settings are at specifications, torque the pivot bar retaining bolts on Vans to 195 ft. lbs. (264 Nm). Torque the cam bolts to 70 ft. lbs. (95 Nm) on Pick-Up and Ramcharger.

Lower Control Arm

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.
2. Remove the shock absorber.

3. Remove the strut bar and disconnect the sway bar from the lower control arm, if equipped.

4. Install spring compressor tool DD-1278, or equivalent to the coil spring and tighten the nut finger tight, then back off half a turn.

5. Remove the cotter pin and lower ball joint nut.

6. Release the lower ball joint taper using ball stud loosening tool C-3564-A, or equivalent.

7. Remove the tool and remove the ball stud from the control arm. Release the compressor tool from the coil spring.

8. Pull the arm down and remove the spring with the rubber isolation pad from the vehicle. Remove the lower control arm pivot bolt from the crossmember and remove the arm from the vehicle.

To install:

9. Install the arm to the crossmember finger tight. Install the spring with the rubber isolators. Install the compressor tool and compress it enough so the lower ball joint can be inserted through the knuckle.

10. Torque $\frac{11}{16}$ —16 lower ball joint nuts to 135 ft. lbs. (183 Nm). Torque $\frac{3}{4}$ —16 nuts to 175 ft. lbs. (237 Nm). Install a new cotter pin. Remove the spring compressor.

11. Install the strut bar and connect the sway bar from the lower control arm, if equipped.

12. Install the shock absorber.

13. Lower the vehicle completely. When the weight of the vehicle is off of the lifting apparatus, torque the lower arm pivot bolts to 175 ft. lbs. (237 Nm) on Vans or 225 ft. lbs. (305 Nm) on Pick-Up and Ramcharger.

14. Align the front end as required.

Sway Bar

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.

2. Remove the front sway bar brackets and retainers.

3. Remove the sway bar connecting links to the control arm or front axle. Remove the sway bar from the vehicle.

4. The installation is the reversal of the removal procedure. Tighten the nuts just enough so the bushings compress to the same outer diameter as the washer adjacent to it.

Front Wheel Bearings

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.

2. Remove the tire and wheel assembly.

3. Remove the caliper and disc brake pads.

4. Remove the dust cap.

5. Remove the cotter pin, castelated nut lock, wheel bearing nut and washer from the spindle.

6. Remove the outer wheel bearing.

7. Remove the rotor with the inner wheel bearing from the spindle. Remove the grease seal.

To install:

8. Lubricate and install the inner wheel bearing. Install a new grease seal.

9. Install the rotor to the spindle.
10. Lubricate and install the outer wheel bearing, washer and nut. When the bearing preload is properly set, install the nut lock and a new cotter pin.
11. Install the grease cap.
12. Install the brake pads and caliper.
13. Install the wheel.

ADJUSTMENT

1. Tighten the wheel bearing nut to 240-300 inch lbs. (27-34 Nm) while turning the rotor.
2. Loosen the wheel bearing adjusting nut completely.
3. Tighten the nut finger tight.
4. Check the wheel bearing endplay. The specification is 0.0001-0.003 in.

5. Install the nut lock and cotter pin.

REAR SUSPENSION

Shock Absorber

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.
2. Remove the bolts that attach the shock to the frame or bracket.
3. Remove the shock from the vehicle.

4. The installation is the reversal of the removal procedure.

Leaf Springs

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.
2. Using the proper equipment, support the weight of the axle.
3. Remove the nuts, washers and U-bolts attaching the springs to the axle housing. Remove the spacer.
4. Remove the spring shackle bolts, shackle and spring front bolt.
5. Remove the springs and auxiliary spring, if equipped, from the vehicle.
6. The installation is the reversal of the removal procedure.

VEHICLE IDENTIFICATION CHART

It is important for servicing and ordering parts to be certain of the vehicle and engine identification. The VIN (vehicle identification number) is a 17 digit number visible through the windshield on the driver's side of the dash and contains the vehicle and engine identification codes. The tenth digit indicates model year and the eighth digit indicates engine code. It can be interpreted as follows:

Engine Code					
Code	Cu. In.	Liters	Cyl.	Fuel Sys.	Eng. Mfg.
C	135	2.2	4	Carb	Chrys
K	153	2.5	4	EFI	Chrys
J	153	2.5	4	Turbo	Chrys
G	156	2.6	4	Carb	Mitsubishi
3	181	3.0	6	EFI	Mitsubishi
R	201	3.3	6	EFI	Chrys
M	239	3.9	6	Carb	Chrys
X	239	3.9	6	EFI	Chrys

Model Year	
Code	Year
G	1986
H	1987
J	1988
K	1989
L	1990

ENGINE ELECTRICAL

NOTE: Disconnecting the negative battery cable on some vehicles may interfere with the functions of the on board computer systems and may require the computer to undergo a relearning process, once the negative battery cable is reconnected.

Distributor

REMOVAL & INSTALLATION

Except 3.3L Engine

1. Disconnect the negative battery cable.
2. Disconnect the distributor pickup lead wires and vacuum hose(s), if equipped. Remove the splash shield, if equipped.
3. Unfasten the distributor cap retaining clips or screws and lift off the distributor cap with all ignition wires still connected. Remove the coil wire if necessary.
4. Matchmark the rotor to the distributor housing.

NOTE: Do not crank the engine during this procedure. If the engine is cranked, the matchmark must be disregarded.

5. Remove the hold-down bolt and clamp.
6. Remove the distributor from the engine.

To install:

7. Install a new distributor housing O-ring.
8. Install the distributor in the engine so the rotor is lined up with the matchmark on the housing. Make sure the distributor is fully seated and that the distributor shaft is fully engaged.
9. If the engine has been cranked, position the engine so that the No. 1 piston is at TDC of the compression stroke and the mark on the vibration damper is lined up with 0 on the timing indicator. Then install the distributor so the rotor is aligned with the position of the No. 1 ignition wire on the distributor cap.

NOTE: There are distributor cap runners inside the cap on 3.0L engines. Make sure the rotor is pointing to where the No. 1 runner originates inside the cap and not where the No. 1 ignition wire plugs into the cap.

10. Install the hold-down clamp and snug the hold-down bolt. Connect the vacuum hose(s), if equipped.

Distributor cap terminal routing — 3.0L engine

11. Connect the distributor pickup lead wires. Install the splash shield, if equipped.
12. Install the distributor cap and snap the retaining clips into place or tighten the screws.
13. Connect the negative battery cable.
14. Adjust the ignition timing and tighten the hold-down bolt.

3.3L Engine

IGNITION COIL

1. Disconnect the negative battery cable.
2. Remove the spark plug wires from the coil.
3. Disconnect the electrical connector.
4. Remove the coil fasteners.
5. Remove the coil from the ignition module.
6. The installation is the reverse of the removal procedure.

CRANK POSITION SENSOR

1. Disconnect the negative battery cable.
2. Disconnect the sensor lead at the harness connector.
3. Remove the sensor retainer bolt.
4. Pull the sensor straight up and out of the transaxle housing.
5. If the removed sensor is being re-installed, clean off the old spacer completely and attach a new spacer to the sensor. If a new spacer is not used, the sensor will not function properly. New sensors are equipped with a new spacer.

To install:

6. Install the sensor in the transaxle housing and push the sensor down until contact is made with the drive plate.
7. Hold in this position and install

the retaining bolt. Torque to 9 ft. lbs. (12 Nm).

8. Connect the sensor lead wire.

CAM POSITION SENSOR

1. Disconnect the negative battery cable.
2. Disconnect the sensor lead at the harness connector.
3. Loosen the sensor retaining bolt enough to allow the slot to slide past the bolt.
4. Pull the sensor (not by the wire) straight up and out of the chain case cover. Resistance may be high due to the presence of the rubber O-ring.
5. If the removed sensor is being re-installed, clean off the old spacer completely and attach a new spacer to the sensor. If a new spacer is not used, the sensor will not function properly. New sensors are equipped with a new spacer.

To install:

6. Inspect the O-ring for damage and replace if necessary.
7. Lubricate the O-ring lightly with oil. Install the sensor to the chain case cover and push the sensor into its bore in the chain case cover until contact is made with the cam timing gear.
8. Hold in this position and tighten the bolt to 9 ft. lbs. (12 Nm).
9. Connect the connector and rout it away from the belt.

Ignition Timing

ADJUSTMENT

NOTE: The 3.3L engine is equipped with distributorless ignition; the timing cannot be changed or set.

1. Start the engine, set the parking brake and run the engine until at nor-

2 CHRYSLER MID SIZE CARAVAN/VOYAGER/TOWN & COUNTRY • DAKOTA

Ignition coil removal and installation—3.3L engine

Crank position sensor location—3.3L engine

Cam position sensor location—3.3L engine

mal operating temperature. Keep all lights and accessories **OFF**.

2. If a magnetic timing unit is available, insert the probe into the receptacle near the timing scale. The scale is located near the crankshaft pulley on 2.6L, 3.0L and 3.9L engines and on the bell housing on 2.2L and 2.5L engines.

3. If a magnetic timing unit is not available, connect a conventional power timing light to the No. 1 cylinder spark plug wire.

4. Connect the red lead of a tachometer to the negative primary terminal of the coil and connect the black lead to a good ground.

5. Disconnect and plug the distributor vacuum advance hose at the computer or distributor. If the vehicle is equipped with a carbureted 2.2L engine, disconnect the carburetor 6-way electrical connector and remove the violet wire from the connector and reconnect the connector. This disables the electronic spark advance. Set the idle speed according to the Vehicle Emission Control Information (VECI) label.

6. If the vehicle is equipped with Electronic Fuel Injection (EFI), disconnect the coolant sensor located near the thermostat housing. The Check Engine lamp on the instrument panel must be **ON**. On 1989–90 vehicles, connect the Diagnostic Readout Box II (DRBII) and access the Basic Timing Mode. If the DRBII is not available, disconnect the coolant sensor located near the thermostat housing. The Check Engine lamp on the instrument panel must be **ON**.

7. Aim the timing light at the timing scale or read the magnetic timing unit.

8. Loosen the distributor hold-down bolt just enough so the distributor can be rotated.

9. Turn the distributor in the proper direction until the specified timing according to the VECI label is reached. Tighten the hold-down bolt and recheck the timing and idle speed.

10. Turn the engine off. Remove the jumper wire, if used. Connect the vacuum hose(s) or coolant sensor (make sure the Check Engine lamp does not come on when the vehicle is restarted). Disconnect the timing apparatus and tachometer. Reinstall the violet wire into the carburetor connector, if it was removed.

11. If the coolant temperature sensor was disconnected, erase the created fault code using the Erase Fault Code mode on the DRBII. If the DRBII is not available, the code can be erased by disconnecting the battery, although it is not recommended.

NOTE: If the battery is disconnected, radio memory will be lost

and other fault codes that may have been stored in the computer's memory will be erased. If the coolant sensor code is not erased at this point, it will disappear after 50-100 vehicle key on/off cycles providing there is no problem with that circuit.

Alternator

For further information on the charging system, please refer to "Charging and Starting" in the Unit Repair section.

BELT TENSION ADJUSTMENT

NOTE: The belt tension is automatically adjusted by a dynamic tensioner on the 3.0L and 3.3L engines. Periodic adjustment is not necessary.

1. Loosen the pivot bolt slightly.
2. Raise the vehicle and support safely, if necessary. Remove the splash shield, if equipped. Loosen the adjuster slot nut or bolt just enough so the alternator can be moved.
3. On 1987 Dakota, use a suitable pry bar and apply tension to the alternator until the belt(s) deflect about $\frac{1}{4}$ – $\frac{1}{2}$ in. under a 10 lb. load. Torque the adjuster strap bolt to 17 ft. lbs. (23 Nm). Torque the pivot bolt to 30 ft. lbs. (41 Nm).
4. If the bracket is equipped with an adjuster bolt, first loosen the locknut, if equipped and tighten the bolt until the belt(s) deflect about $\frac{1}{4}$ – $\frac{1}{2}$ in. under a 10 lb. load. Tighten the adjuster slot bolt and pivot bolt.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. On some 2.2L and 2.5L engines, remove the air conditioning compressor and position it to the side. Remove the oil filter to allow the alternator to be removed from above, if possible.
3. On 3.0L and 3.3L engines, release the dynamic belt tensioner and remove the belt. On all other engines, loosen the mounting bolts, move the alternator toward the engine and remove the drive belt(s).
4. Remove the mounting bolts, spacers and adjuster bolt, if equipped and remove the alternator from the brackets.
5. Remove the battery positive, field and ground terminals from the rear of the alternator. Remove the wire harness hold-down screw from the alternator, if equipped.

To install:

6. Connect all wiring to the proper terminals on the rear of the alternator and install the wire harness hold-down screw, if equipped.
7. Position the alternator in the mounting brackets.
8. Install the spacers, pivot bolt, belt(s), adjuster slot bolt or nut and adjuster bolt, if equipped. Install the air conditioning compressor and oil filter, if they were removed.
9. Adjust the belt tension, if necessary.
10. Connect the negative battery cable.

Voltage Regulator

For further information on the charging system, please refer to "Charging and Starting" in the Unit Repair section.

REMOVAL & INSTALLATION

NOTE: The voltage regulator is integrated into the circuitry of the Single Module Engine Controller (SMEC) or Single Board Engine Controller (SBEC) on vehicles equipped with EFI and is not serviceable. The voltage regulator is internally mounted in the alternator on vehicles equipped with the 2.6L engine.

1. Disconnect the negative battery cable.
2. Unplug the connector from the voltage regulator.
3. Remove the retaining screws and remove the regulator from the vehicle.
4. The installation is the reverse of the removal procedure. Make sure the connector retainer is properly clipped in place.

Starter

For further information on the charging system, please refer to "Charging and Starting" in the Unit Repair section.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
 2. On 2.2L and 2.5L engines, remove the attaching nut and bolt at the top of the bell housing. Raise the vehicle and support safely.
 3. Remove the rear mount from the starter, if equipped. Remove the heat shield from the starter, if equipped.
 4. Unbolt the starter, remove the exhaust bracket and automatic transmission oil cooler tube bracket, if equipped and remove the starter from the vehicle.
 5. Disconnect the solenoid lead wires from the starter.
- To install:**
6. Connect the solenoid lead wires and install the heat shield, if equipped.
 7. On the 3.9L engine, install the starter to the bellhousing and install the mounting bolt loosely. Install the automatic transmission oil cooler tube bracket and exhaust bracket, if equipped. Install the lower mounting nut. Torque both to 50 ft. lbs. (68 Nm).
 8. On the 2.2L and 2.5L engines, install the lower bolt loosely, then lower the vehicle and install the nut and bolt from above and torque to 40 ft. lbs. (54 Nm). Then raise the vehicle again and torque the bottom bolt to the same value. Install the rear mount to the starter.
 9. On 3.0L and 3.3L engines, install all mounting bolts and torque to 40 ft. lbs. (54 Nm) evenly.
 10. Connect the negative battery cable and check the starter for proper operation.

Removing or Installing the starter—2.2L and 2.5L engines

CHASSIS ELECTRICAL

Heater Blower Motor

REMOVAL & INSTALLATION

Caravan, Voyager and Town & Country

1. Disconnect the negative battery cable.
2. Disconnect the blower motor lead under the right side of the instrument panel.
3. Remove 5 attaching screws securing the blower to the heater A/C housing.
4. Lower the blower from its cavity and remove it from the vehicle.
5. Remove the fan from the blower.
6. The installation is the reverse of the removal procedure.
7. Connect the negative battery cable and check the blower motor for proper operation.

WITH REAR HEATER

1. Disconnect the negative battery cable.
2. Remove the middle bench, if equipped. Remove the left lower quarter trim panel.
3. Remove 1 blower scroll cover to floor screw and 7 screws to unit.
4. Remove the blower relay.
5. Rotate the blower scroll cover from under the unit.
6. Remove the fan from the blower motor, remove the 3 motor attaching screws and remove the motor from the unit.
7. The installation is the reverse of the removal procedure.
8. Connect the negative battery cable and check the blower motor for proper operation.

Dakota

1. Disconnect the negative battery cable.
2. Remove the steering column cover, intermittent wiper control and the lower instrument panel module retaining screw to the right of the steering column.
3. Remove the center distribution duct retaining screws and panel support screw at the bottom of the module.
4. Remove the courtesy lamp at the lower right corner of the module and the screw near the ash receiver.
5. Open the glovebox and remove the screws along the top edge.

Rear heater unit — Caravan, Voyager and Town & Country

Lower instrument panel module — Dakota

6. Move the module out and down far enough to unclip the wiring harness and antenna cable and disconnect the speaker wire (if equipped with monaural radio) and glovebox light wire. Remove the module from the vehicle.

7. If the vehicle is equipped with air conditioning, disconnect the 2 vacuum lines from the recirculating air door actuator and disconnect the blower lead wires.

8. Remove 2 screws at the top of the blower housing, 5 screws from around the housing and remove the blower housing from the unit.

9. Remove 3 screws attaching the blower to the unit and remove the blower from the vehicle.

10. Remove the fan from the blower motor.

To install:

11. Install the fan to the blower motor and secure the clip.

12. Install the blower to the unit and install the blower housing.

13. Connect the 2 vacuum lines from the recirculating air door actuator, if equipped and connect the blower lead wires.

14. Hold the module in position and clip the wiring harness and antenna cable in place and connect the speaker wire (if equipped with monaural radio) and glovebox light wire.

15. Install the retaining screws along the top of the inside of the glovebox.

16. Install the courtesy lamp at the lower right corner of the module and the screw near the ash receiver.

17. Install the panel support screw at the bottom of the module and the center distribution duct retaining screws and .

18. Install the lower instrument panel module retaining screw to the right of the steering column, intermittent wiper control and the steering column cover.

19. Connect the negative battery cable and check the blower motor for proper operation.

Windshield Wiper Motor

REMOVAL & INSTALLATION

Caravan, Voyager and Town & Country

1. Disconnect the negative battery cable.
2. Remove the wiper arms.
3. Open the hood and remove the cowl top plenum grille and the plastic screen.
4. Remove the wiper pivot retaining screws and push the pivots down into the plenum chamber.
5. Remove the nut from the wiper motor output shaft and remove the linkage assembly from the motor.

6. Disconnect the wiper motor harness, remove the mounting nuts and remove the motor from the vehicle.

7. The installation is the reverse of the removal procedure.

8. Connect the negative battery cable and check the wipers for proper operation.

Dakota

1. Disconnect the negative battery cable.

2. Disconnect the connector from the motor.

3. Remove the wiper arms, raise the hood and remove the cowl panel.

4. Hold the drive crank with a wrench while remove the crank nut. Remove the drive crank.

5. Remove the mounting nuts and remove the motor from the vehicle.

6. The installation is the reverse of the removal procedure.

7. Connect the negative battery cable and check the wipers for proper operation.

Removing the liftgate wiper arm

Liftgate Wiper System

REMOVAL & INSTALLATION

Caravan, Voyager and Town & Country

1. Disconnect the negative battery cable.

2. Remove the liftgate wiper using the special removal tool.

CAUTION

Prying the arm off of the shaft with a prying device could damage the arm permanently and possibly cause it to pop off of the shaft while in operation causing poor rear vision for the driver and a dangerous situation for the driver behind. Do not bend or push the spring clip at the base of the arm to release the arm; it is self-releasing. Use only the indicated tool.

3. Open the liftgate and remove the trim panel.

4. Remove the motor mounting screws, disconnect the wiring harness and remove the motor from the liftgate.

4. The installation is the reverse of the removal procedure.

5. Connect the negative battery cable and check the rear wiper for proper operation.

Windshield Wiper Switch

REMOVAL & INSTALLATION

Except Tilt Wheel

1. Disconnect the negative battery cable.

2. Remove the lower steering column cover, if equipped.

3. Remove the horn pad mounting screws from behind the steering wheel and remove the horn pad.

4. Remove the steering wheel nut, matchmark the steering wheel to the shaft and remove the steering wheel with a suitable puller.

5. Remove the plastic wiring channel from the underside of the steering column.

6. Disconnect the wiper switch connector, intermittent wipe module connector and cruise control connector, if equipped.

7. Remove the side lock housing cover.

8. Remove the slotted hex-head screw that attaches the wiper switch to the turn signal switch and remove the switch.

9. Remove the control knob from the end of the stalk. Pull the round nylon hider up the control stalk and remove the revealed screws that attach the control stalk sleeve to the wiper switch.

10. Rotate the control stalk shaft to the full clockwise position and remove the shaft from the wiper switch by pulling it straight out.

To install:

11. Install the control shaft to the wiper switch, install the screws, the hider and the control knob.

12. Run the wiring through the opening and down the steering column, position the switch and install the hex-head screw. Make sure the dimmer switch rod is properly engaged.

13. Install the side lock housing cover.

14. Connect the wires and install the wiring channel.

15. Install the steering wheel torque the nut to 45 ft. lbs. (61 Nm).

16. Install the horn pad.

17. Connect the negative battery ca-

ble and check the wiper and washer, cruise control, turn signal switch and dimmer switch for proper operation.

18. Install the lower column cover, if equipped.

Tilt Wheel

1. Disconnect the negative battery cable.

2. Remove the lower steering column cover, if equipped and remove the plastic wiring channel from the underside of the steering column.

3. Remove the horn pad mounting screws from behind the steering wheel and remove the horn pad.

4. Remove the steering wheel nut, matchmark the steering wheel to the shaft and remove the steering wheel with a suitable puller.

5. Depress the lock plate with the proper depressing tool, remove the retaining ring from its groove and remove the tool, ring, lock plate, cancelling cam and spring.

6. Remove the switch stalk actuator screw and arm.

7. Remove the hazard switch knob.

8. Disconnect the turn signal switch, wiper switch, intermittent module and cruise control connectors, if equipped.

9. Remove the 3 screws and remove the turn signal switch. Tape the connector to the wires to aid in removal.

10. Remove the ignition key lamp.

11. Place the key in the LOCK position and remove the key. Insert a thin tool into the slot next to the switch mounting screw boss, depress the spring latch at the bottom of the slot releasing the lock. Remove the lock cylinder.

12. Remove the buzzer switch and wedge spring.

13. Remove the 3 housing cover screws and remove the housing cover.

14. Remove the wiper switch pivot pin with a punch and remove the switch.

Removing the wiper switch—except tilt wheel

15. Remove the control knob from the end of the stalk. Pull the round nylon hider up the control stalk and remove the revealed screws that attach the control stalk sleeve to the wiper switch.

16. Rotate the control stalk shaft to the full clockwise position and remove the shaft from the wiper switch by pulling it straight out.

To install:

17. Install the control shaft to the wiper switch, install the screws, the hider and the control knob.

18. Run the wiring through the

opening and down the steering column, position the switch and install the wiper switch pivot pin.

19. Install the housing cover.

20. Install the buzzer switch and wedge spring.

21. Install the lock cylinder.

22. Install the ignition key lamp.

23. Install the turn signal switch, switch stalk actuator arm and hazard switch knob.

24. Install the spring, cancelling cam, lock plate and ring on the steering shaft. Depress the plate with the depressing tool and install the ring se-

curely in the groove. Remove the tool slowly.

25. Connect the turn signal switch, wiper switch, intermittent module and cruise control connectors, if equipped. Install the trough.

26. Install the steering wheel torque the nut to 45 ft. lbs. (61 Nm).

27. Install the horn pad.

28. Connect the negative battery cable and check the wiper and washer, cruise control, turn signal switch and dimmer switch for proper operation.

29. Install the lower column cover, if equipped.

Instrument Cluster

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the instrument cluster bezel. Cluster removal is not necessary if just removing gauges.

3. When only removing gauge(s) or the speedometer, remove the trip odometer reset knob if equipped, remove the mask and lens assembly and remove the desired gauge from the cluster. Disconnect the speedometer cable if removing the speedometer.

4. If equipped with automatic transmission or transaxle, remove the lower column cover and disconnect the gear indicator cable.

5. Remove the screws attaching the cluster to the instrument panel.

6. Pull the cluster out and disconnect all wiring and the speedometer cable. Remove the cluster from the vehicle.

To install:

7. Position the cluster and feed the gear indicator cable through its slot.

8. Connect all wiring and install the speedometer cable to the speedometer. Make sure it is securely clicked in place.

9. Install the cluster retaining screws. Connect the gearshift indicator cable.

10. Install the cluster bezel.

11. Connect the negative battery cable and check all gauges and the speedometer for proper operation. Make sure the gearshift indicator is properly aligned.

Radio

REMOVAL & INSTALLATION

Caravan, Voyager and Town & Country

1. Disconnect the negative battery cable.

2. If equipped with a lower console, remove the ash tray and remove the 2

screws behind it. Remove the lower mounting screws on both sides of the console and pull the console forward. If not equipped with a lower console, open the ash tray and remove the tray.

3. Remove the 2 screws at the lower edge of the bezel. Remove the 3 screws from the top edge of the bezel and remove the bezel.

4. Remove the screws that attach the radio to the dash.

5. Pull the radio out, disconnect the connectors, ground cable and antenna and remove the radio.

6. The installation is the reverse of the removal procedure.

Dakota

1. Disconnect the negative battery cable.

2. Remove the steering column cover and remove the instrument panel bezel. Two screws are hidden behind the steering column cover.

3. Remove the screws that attach the radio to the dash.

4. Pull the radio out, disconnect the connectors, ground cable and antenna and remove the radio.

5. The installation is the reverse of the removal procedure.

Headlight Switch

REMOVAL & INSTALLATION

Caravan, Voyager and Town & Country

1. Disconnect the negative battery cable.

2. Remove the headlight and accessory switch trim bezel.

3. Remove the switch plate from the lower panel, pull the assembly out and disconnect the wiring.

4. Depress the spring button and remove the headlight switch knob and stem.

5. Remove the headlight switch retainer and remove the switch.

6. The installation is the reverse of the removal procedure.

Dakota

1. Disconnect the negative battery cable.

2. Remove the steering column cover and remove the instrument panel bezel. Two screws are hidden behind the steering column cover.

3. Remove the screws from the headlight switch bezel, pull the assembly out and disconnect the wiring.

4. Remove the nut retaining the bezel to the bracket. Depress the spring button on the right side of the switch and remove the headlight switch knob and stem.

Headlight and accessory switch removal and installation - Caravan, Voyager and Town & Country

5. Remove the spanner nut and remove the switch.

6. The installation is the reverse of the removal procedure.

Dimmer Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the lower steering column cover, if equipped.

3. Unplug the switch.

4. Holding the actuating rod against its upper seat, remove the bolts that attach the switch to the column and remove the switch.

5. The installation is the reverse of the removal procedure. Adjust the switch as required.

6. Connect the negative battery cable and check the switch for proper operation.

Remove the slotted hex-head screw that attaches the wiper switch to the turn signal switch.

7. Remove the 3 screws and pull the turn signal switch out of the column.

To install:

8. Run the wiring through the opening and down the steering column, position the switch and install the hex-head screw. Make sure the dimmer switch rod is properly engaged.

9. Install the 3 screws and the hazard switch knob.

10. Connect the wires and install the wiring channel.

11. Install the steering wheel torque the nut to 45 ft. lbs. (61 Nm).

12. Install the horn pad.

13. Connect the negative battery cable and check the turn signal switch and dimmer switch for proper operation.

14. Install the lower column cover, if equipped.

Turn Signal Switch

REMOVAL & INSTALLATION

Except Tilt Column

1. Disconnect the negative battery cable.

2. Remove the lower steering column cover, if equipped.

3. Remove the horn pad mounting screws from behind the steering wheel and remove the horn pad.

4. Remove the steering wheel nut, matchmark the steering wheel to the shaft and remove the steering wheel with a suitable puller.

5. Remove the plastic wiring channel from the underside of the steering column and disconnect the turn signal switch connector.

6. Remove the hazard switch knob.

Tilt Column

1. Disconnect the negative battery cable.

2. Remove the lower steering column cover, if equipped and remove the plastic wiring channel from the underside of the steering column.

3. Remove the horn pad mounting screws from behind the steering wheel and remove the horn pad.

4. Remove the steering wheel nut, matchmark the steering wheel to the shaft and remove the steering wheel with a suitable puller.

5. Depress the lock plate with the proper depressing tool, remove the retaining ring from its groove and remove the tool, ring, lock plate, canceling cam and spring.

6. Remove the stalk actuator screw and arm.

7. Remove the hazard switch knob.
8. Disconnect the turn signal switch connector.

9. Remove the 3 screws and remove the turn signal switch. Tape the connector to the wires to aid in removal.

To install:

10. Run the wiring through the opening and down the steering column, install the turn signal switch, switch stalk actuator arm and hazard switch knob.

11. Install the spring, cancelling cam, lock plate and ring on the steering shaft. Depress the plate with the depressing tool and install the ring securely in the groove. Remove the tool slowly.

12. Connect the turn signal switch connector and install the channel.

13. Install the steering wheel torque the nut to 45 ft. lbs. (61 Nm).

14. Install the horn pad.

15. Connect the negative battery cable and check the turn signal switch and dimmer switch for proper operation.

16. Install the lower column cover, if equipped.

Removing the key lock cylinder—except tilt wheel

Removing the key lock cylinder—tilt column

Ignition Lock

REMOVAL & INSTALLATION

Except Tilt Column

1. Disconnect the negative battery cable.

2. Remove the horn pad mounting screws from behind the steering wheel and remove the horn pad.

3. Remove the steering wheel nut, matchmark the steering wheel to the shaft and remove the steering wheel with a suitable puller.

4. Remove the hazard switch knob. Remove the slotted hex-head screw that attaches the wiper switch to the turn signal switch.

5. Remove the 3 screws and pull the turn signal switch out of the column as far as it will go. Unplug it below if necessary.

6. Remove the ignition switch key lamp.

7. Place the key in the **LOCK** position and remove the key.

8. Insert 2 suitable small diameter tools into both release holes and push inward to release the spring loaded lock retainers while simultaneously pulling the key lock cylinder out of its bore.

To install:

9. Install the key cylinder.

10. Install the ignition switch key lamp.

11. Install the turn signal switch and hazard switch knob. Connect the wires if they were disconnected.

12. Install the steering wheel torque the nut to 45 ft. lbs. (61 Nm).

13. Install the horn pad.

14. Connect the negative battery cable and check the lock cylinder for proper operation.

15. Install the lower column cover, if equipped.

Tilt Column

1. Disconnect the negative battery cable.

2. Remove the horn pad mounting screws from behind the steering wheel and remove the horn pad.

3. Remove the steering wheel nut, matchmark the steering wheel to the shaft and remove the steering wheel with a suitable puller.

4. Depress the lock plate with the proper depressing tool, remove the retaining ring from its groove and remove the tool, ring, lock plate, cancelling cam and spring.

5. Remove the stalk actuator screw and arm.

6. Remove the hazard switch knob.

7. Remove the 3 screws and pull the turn signal switch out of the column as far as it will go. Unplug it below if necessary.

8. Remove the ignition key lamp.

9. Place the key in the **LOCK** position and remove the key. Insert a thin tool into the slot next to the switch mounting screw boss, depress the spring latch at the bottom of the slot releasing the lock and remove the lock cylinder.

To install:

10. Install the lock cylinder.

11. Install the ignition key lamp.

12. Install the turn signal switch, switch stalk actuator arm and hazard switch knob.

13. Install the spring, cancelling cam, lock plate and ring on the steering shaft. Depress the plate with the depressing tool and install the ring securely in the groove. Remove the tool slowly.

14. Connect the wires if they were disconnected.
15. Install the steering wheel torque the nut to 45 ft. lbs. (61 Nm).
16. Install the horn pad.
17. Connect the negative battery cable and check the turn signal switch for proper operation.
18. Install the lower column cover, if it was removed.

Stoplight Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the switch mounting bracket assembly from the brake pedal bracket.
3. Remove the switch from its bracket.
4. The installation is the reverse of the removal procedure.
5. Connect the negative battery cable and check the switch for proper operation.

Fuses and Circuit Breakers

LOCATION

In all vehicles, the fuse block is located to the left of the steering column, covered by a removeable access panel.

ENGINE COOLING

Radiator

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Open the radiator petcock and drain the antifreeze. Once the antifreeze has stopped draining, close the petcock.
3. Remove the upper hose and coolant reserve tank hose from the radiator.
4. If equipped with an electric cooling fan, remove the fan assembly.
5. If equipped with a belt driven fan, remove the shroud from the radiator and position it away from the radiator.
6. Raise the vehicle and support safely. Remove the lower hose from the radiator.
7. Disconnect the automatic trans-

mission or transaxle cooler hoses, if equipped and plug them.

8. Remove the mounting screws and carefully lift the radiator out of the engine compartment.

To install:

9. Lower the radiator into position and install the mounting screws.
10. Raise the vehicle and support safely if necessary. Connect the automatic transmission or transaxle cooler lines, if they were removed.
11. Connect the lower hose.
12. Install the shroud or electric cooling fan.
13. Connect the upper hose and coolant reserve tank hose.
14. Fill the system with coolant.
15. Connect the negative battery cable, run the vehicle until the thermostat opens, fill the radiator completely and check the automatic transmission or transaxle fluid level, if equipped.
16. Once the vehicle has cooled, recheck the coolant level.

Electric Cooling Fan

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Unplug the connector.
3. Remove the mounting screws.
4. Remove the fan assembly from the vehicle.
5. The installation is the reverse of the removal procedure.

TESTING

CAUTION

Make sure the key is in the OFF position when checking the electric cooling fan. If not, the fan could turn on at any time, causing serious personal injury.

1. Unplug the fan connector.
2. Using a jumper wire, connect the female terminal of the fan connector to the negative battery terminal.
3. The fan should come on when the other wire is connected to the positive battery terminal.
4. If not, the fan is defective and should be replaced.

Heater Core

REMOVAL & INSTALLATION

Caravan and Voyager Without Air Conditioning

1. Disconnect the negative battery cable. Drain the cooling system.
2. Remove the lower steering column cover.

3. Remove the lower reinforcement under the steering column, right side cowl and sill trim. Remove the bolt holding the right side instrument panel to the right cowl.

4. Loosen the 2 brackets supporting the lower edge of the heater housing. Remove the instrument panel trim covering and reinforcement. Remove the retaining screws from the right side to the steering column.

5. Disconnect the vacuum line at the brake booster.

6. Clamp off the heater hoses near the heater core and remove the hoses from the core tubes. Plug the hose ends and the core tubes to prevent spillage of coolant. Remove the heater assembly retaining nuts at the firewall.

7. Disconnect the blower motor wiring, resistor wiring and the temperature control cable. Disconnect the hanger strap from the package and rotate it out of the way.

8. Pull the right side of the instrument panel out as far as possible. Fold the carpeting and insulation back to provide a little more working room and to prevent spillage from staining the carpeting.

9. Pull the heater core assembly out from under instrument panel and remove it from the vehicle.

10. Disassemble the heater unit by removing the retaining screws from the cover. Remove the cover and the temperature control rod.

11. Remove the retaining screw from the heater core and remove the core from the housing assembly.

To install:

12. Clean out the inside of the housing. Wrap the heater core with foam tape and place it in position. Secure it with its screw.

13. Assemble the heater unit.

14. Install the assembly to the vehicle and install the nuts to the firewall. Fold the carpeting back into position.

15. Connect the hanger strap from the package and rotate it out of the way. Install the 2 brackets supporting the lower edge of the heater housing. Connect the blower motor wiring, resistor wiring and the temperature control cable.

16. Install the retaining screws from the right side to the steering column. Install the instrument panel trim covering and reinforcement.

17. Install the bolt holding the right side instrument panel to the right cowl. Install the lower reinforcement under the steering column, right side cowl and sill trim.

18. Install the heater hoses to the core tubes.

19. Connect the vacuum line at the brake booster.

20. Fill the cooling system.

21. Connect the negative battery cable and check the heater for proper operation and leaks.

Caravan, Voyager and Town & Country With Air Conditioning

1. Disconnect the negative battery cable. Properly discharge the A/C system. Drain the cooling system.

2. Remove the lower steering column cover.

3. Remove the lower reinforcement under the steering column, right side cowl and sill trim. Remove the bolt holding the right side instrument panel to the right cowl.

4. Loosen the 2 brackets supporting the lower edge of the heater housing. Remove the instrument panel trim covering and reinforcement. Remove the retaining screws from the right side to the steering column.

5. Disconnect the vacuum lines at the brake booster and water valve.

6. Clamp off the heater hoses near the heater core and remove the hoses from the core tubes. Plug the hose ends and the core tubes to prevent spillage of coolant.

7. Disconnect the H-valve connection at the valve and remove the H-valve. Remove the retaining nuts from the package mounting studs at the firewall. Remove the condensation tube.

8. Disconnect the blower motor wiring, resistor wiring and the temperature control cable. Disconnect the vacuum harness at the connection at the top of the heater unit.

9. Disconnect the hanger strap from the package and rotate it out of the way.

10. Pull the right side of the instrument panel out as far as possible. Fold the carpeting and insulation back to provide a little more working room and to prevent spillage from staining the carpeting.

11. Remove the entire housing assembly from the dash panel and remove it from the vehicle.

12. To disassemble the housing assembly, remove the vacuum diaphragm and retaining screws from the cover and remove the cover.

13. Remove the retaining screw from the heater core and remove the core from the housing assembly.

To install:

14. Remove the temperature control door from the unit and clean the unit out with solvent. Lubricate the lower pivot rod and its well and install. Wrap the heater core with foam tape and place it in position. Secure it with its screw.

15. Assemble the unit, making sure all vacuum tubing is properly routed.

16. Install the assembly to the vehicle and connect the vacuum harness. Install the nuts to the firewall and install the condensation tube. Fold the carpeting back into position.

17. Connect the hanger strap from the package and rotate it out of the way. Install the 2 brackets supporting the lower edge of the heater housing. Connect the blower motor wiring, resistor wiring and the temperature control cable.

18. Install the retaining screws from the right side to the steering column. Install the instrument panel trim covering and reinforcement.

19. Install the bolt holding the right side instrument panel to the right cowl. Install the lower reinforcement under the steering column, right side cowl and sill trim.

20. Connect the vacuum lines at the brake booster and water valve.

21. Connect the heater hoses to the core tubes.

22. Using new gaskets, install the H-valve and connect the hose connection at the valve.

23. Evacuate and recharge the air conditioning system.

24. Fill the cooling system.

25. Connect the negative battery cable and check the entire climate control system for proper operation and leakage.

Dakota Without Air Conditioning

1. Disconnect the negative battery cable. Drain the coolant.

2. Remove the steering column cover, intermittent wiper control, if equipped and the lower instrument panel module retaining screw to the right of the steering column.

3. Remove the center distribution duct retaining screws and panel support screw at the bottom of the module.

4. Remove the courtesy lamp at the lower right corner of the module and the screw near the ash tray.

5. Open the glovebox and remove the screws along the top edge.

6. Move the module out and down far enough to unclip the wiring harness and antenna cable and disconnect the speaker wire (if equipped with monaural radio) and glovebox light wire. Remove the module from the vehicle.

7. Remove the center air distribution duct.

8. Remove the antenna wire from retaining clip at the right end of the heater unit.

9. Disconnect the blower motor connector and remove the thermal insulator retainer from the heater unit.

10. Disconnect the demister hoses

from the adaptor at the top of the heater unit.

11. Disconnect the vacuum feed line from the check valve.

12. Disconnect the temperature control cable flag retainer from the heater unit.

13. Remove the adjusting clip from the blend air door crank.

14. Disconnect the heater hoses from the core tubes and plug them.

15. Remove 4 heater unit attaching nuts from the rear engine compartment dash panel.

16. Remove the heater unit support attaching screw and rotate the brace out of the way.

17. Remove the heater unit from the vehicle.

18. To disassemble the housing assembly, vacuum diaphragm and retaining screws from the cover and remove the cover.

19. Remove the retaining screw from the heater core and remove the core from the housing assembly.

To install:

20. Remove the temperature control door from the unit and clean the unit out with solvent. Lubricate the lower pivot rod and its well and install. Wrap the heater core with foam tape and place it in position. Secure it with its screw.

21. Assemble the unit, making sure all vacuum tubing is properly routed.

22. Install the assembly to the vehicle and connect the vacuum harness. Install the nuts to the firewall. Install the support brace to the heater unit.

23. Connect the demister hoses to the adaptor at the top of the heater unit.

24. Connect the blower motor connector and install the thermal insulator retainer to the heater unit.

25. Connect the vacuum feed line to the check valve.

26. Connect the temperature control cable flag retainer to the heater unit and install the adjusting clip from the blend air door crank.

27. Install the center air distribution duct.

28. Install the antenna wire from retaining clip at the right end of the heater unit.

29. Install the instrument panel module and all related parts.

30. Connect the heater hoses to the core tubes.

31. Fill the cooling system.

32. Connect the negative battery cable and check the heater for proper operation and leakage.

Dakota With Air Conditioning

1. Disconnect the negative battery cable. Properly discharge the air conditioning system. Drain the coolant.

2. Remove the steering column cover, intermittent wiper control and the lower instrument panel module retaining screw to the right of the steering column.

3. Remove the center distribution duct retaining screws and panel support screw at the bottom of the module.

4. Remove the courtesy lamp at the lower right corner of the module and the screw near the ash tray.

5. Open the glovebox and remove the screws along the top edge.

6. Move the module out and down far enough to unclip the wiring harness and antenna cable and disconnect the speaker wire (if equipped with monaural radio) and glovebox light wire. Remove the module from the vehicle.

7. Remove the center air distribution duct.

8. Remove the antenna wire from retaining clip at the right end of the heater unit.

9. Disconnect the blower motor connector and remove the thermal insulator retainer from the heater unit.

10. Disconnect the demister hoses from the adaptor at the top of the heater unit.

11. Disconnect the vacuum harness connector from the air conditioning control hose and vacuum feed line from the check valve.

12. Disconnect the temperature control cable flag retainer from the heater unit and remove the adjusting clip from the blend air door crank.

13. Disconnect the heater hoses from the core tubes and plug them.

14. Remove the condensation drain tube.

15. Remove 4 heater-A/C unit attaching nuts from the rear engine compartment dash panel.

16. Remove the heater-A/C unit support attaching screw and rotate the brace out of the way.

17. Remove the heater-A/C unit from the vehicle.

18. To disassemble the housing assembly, vacuum diaphragm and retaining screws from the cover and remove the cover.

19. Remove the retaining screw from the heater core and remove the core from the housing assembly.

To install:

20. Remove the temperature control door from the unit and clean the unit out with solvent. Lubricate the lower pivot rod and its well and install. Wrap the heater core with foam tape and place it in position. Secure it with its screw.

21. Assemble the unit, making sure all vacuum tubing is properly routed.

22. Install the assembly to the vehi-

cle and connect the vacuum harness. Install the nuts to the firewall and install the condensation tube. Install the support brace to the heater-A/C unit.

23. Connect the demister hoses to the adaptor at the top of the heater unit.

24. Connect the blower motor connector and install the thermal insulator retainer to the heater unit.

25. Connect the vacuum harness connector to the air conditioning control hose and vacuum feed line to the check valve.

26. Connect the temperature control cable flag retainer to the heater unit and install the adjusting clip from the blend air door crank.

27. Install the center air distribution duct.

28. Install the antenna wire from retaining clip at the right end of the heater unit.

29. Install the instrument panel module and all related parts.

30. Connect the heater hoses to the core tubes.

31. Using new gaskets, install the H-valve and connect the hose connection at the valve.

32. Evacuate and recharge the air conditioning system.

33. Fill the cooling system.

34. Connect the negative battery cable and check the entire climate control system for proper operation and leakage.

Water Pump

REMOVAL & INSTALLATION

2.2L and 2.5L Engines

1. Disconnect the negative battery cable.
2. Drain the cooling system.
3. If the vehicle is equipped with air

conditioning, remove the compressor from the bracket and position it to the side.

4. Raise the vehicle and support safely, if necessary and remove the alternator and bracket. Remove the pulley from the water pump.

5. Disconnect the lower radiator hose and heater hose from the water pump.

6. Remove the water pump housing attaching screws and remove the assembly from the vehicle. Discard the O-ring.

7. Remove the water pump from the housing.

To install:

8. Using a new gasket or silicone sealer, install the water pump to the housing.

9. Install a new O-ring to the housing and install to the engine. Torque the bolts to 21 ft. lbs. (30 Nm).

10. Install the water pump pulley. Connect the radiator hose and heater hose to the water pump.

11. Install all items removed to gain access to the water pump and adjust the belts.

12. Remove the hex-head plug on the top of the thermostat housing (some carbureted engines have a vacuum switching valve at that location). Fill the radiator with coolant until the coolant comes out the plug hole. Install the plug or valve and continue to fill the radiator.

13. Connect the negative battery cable, run the vehicle until the thermostat opens, fill the radiator completely and check for leaks.

14. Once the vehicle has cooled, recheck the coolant level.

2.6L Engine

1. Disconnect the negative battery cable.

Water pump—2.2L and 2.5L engines

Water pump assembly—2.6L engine

2. Drain the cooling system. Remove the air cleaner assembly.

3. Remove the radiator hose, bypass hose and heater hose from the water pump.

4. Remove the drive pulley shield.

5. Remove the locking screw and pivot screws.

6. Remove the water pump retaining bolts and remove the water pump from the engine. Discard the O-ring from the body.

7. Remove the pump from the pump body.

To install:

8. Using a new gasket, install the water pump to the pump body.

9. Install a new O-ring to the pump body and install to the engine.

10. Install the mounting screws finger tight. Adjust the belt tension and torque the bolts to 17 ft. lbs. (23 Nm).

11. Install the pulley shield.

12. Install the radiator hose, bypass hose and heater hose to the water pump.

13. Install the air cleaner assembly.

14. Fill the radiator with coolant. This cooling system has a self-bleeding thermostat, so system bleeding is not required.

15. Connect the negative battery cable, run the vehicle until the thermostat opens, fill the radiator completely and check for leaks.

16. Once the vehicle has cooled, re-check the coolant level.

2. Drain the cooling system.

3. Remove the timing cover. If the same timing belt will be reused, mark the direction of the timing belt's rotation, for installation in the same direction. Make sure the engine is positioned so the No. 1 cylinder is at the TDC of its compression stroke and the sprockets timing marks are aligned with the engine's timing mark indicators.

4. Loosen the timing belt tensioner bolt and remove the belt. Position the tensioner as far away from the center of the engine as possible and tighten the bolt. Remove the water pump mounting bolts, separate the pump

from the water inlet pipe and remove the pump from the engine.

To install:

5. Install the pump with a new gasket to the engine. Torque the water pump mounting bolts to 20 ft. lbs. (27 Nm).

6. If not already done, position both camshafts so the marks line up with those on the alternator bracket (rear bank) and inner timing cover (front bank). Rotate the crankshaft so the timing mark aligns with the mark on the oil pump.

7. Install the timing belt on the crankshaft sprocket and while keeping the belt tight on the tension side (right side), install the belt on the front camshaft sprocket.

8. Install the belt on the water pump pulley, then the rear camshaft sprocket and the tensioner.

9. Rotate the front camshaft counterclockwise to tension the belt between the front camshaft and the crankshaft. If the timing marks came out of line, repeat the procedure.

10. Install the crankshaft sprocket flange.

11. Loosen the tensioner bolt and allow the spring to tension the belt.

12. Turn the crankshaft 2 full turns in the clockwise direction only until the timing marks align again. Now that the belt is properly tensioned, torque the tensioner lock bolt to 21 ft. lbs. (29 Nm).

13. Refill the cooling system. This system uses a self-bleeding thermostat, so there is no need to bleed the system. Connect the negative battery cable and road test the vehicle.

3.3L Engine

1. Disconnect the negative battery cable.

Water pump assembly—3.0L engine

3.0L Engine

1. Disconnect the negative battery cable.

Water pump—3.3L engine

2. Drain the cooling system.
3. Remove the serpentine belt.
4. Raise the vehicle and support safely. Remove the right front tire and wheel assembly and lower fender shield.

5. Remove the water pump pulley.
6. Remove the 5 mounting screws and remove the pump from the engine.
7. Discard the O-ring.

To install:

8. Using a new O-ring, install the pump to the engine. Torque the mounting bolts to 21 ft. lbs. (30 Nm).
9. Install the water pump pulley.
10. Install the fender shield and tire and wheel assembly. Lower the vehicle.
11. Install the serpentine belt.
12. Remove the engine temperature sending unit. Fill the radiator with coolant until the coolant comes out the sending unit hole. Install the sending unit and continue to fill the radiator.
13. Connect the negative battery cable, run the vehicle until the thermostat opens, fill the radiator completely and check for leaks.
14. Once the vehicle has cooled, recheck the coolant level.

3.9L Engine

1. Disconnect the negative battery cable. Drain the coolant.
2. Remove the shroud from the radiator and slide it over the fan.
3. Remove the radiator and lower hose.
4. Remove the fan blade, spacer or viscous drive unit, pulley, bolts and shroud together. Remove the air pump belt and power steering pump belt.

NOTE: Do not place the viscous fan in an upright position because the silicone fluid in the drive could drain into the bearing and contaminate its lubricant.

5. Loosen the alternator mounting bolts and remove the alternator/air conditioning or idler pulley belts.
6. Remove the alternator bracket. On 1988–90 vehicles, this bracket also supports the air conditioning compres-

sor or idler pulley, which will remain supported by its rear mount.

7. Remove the air pump. Remove the air pump bracket and unbolt the power steering pump bracket with the pump still attached and position it out of the way.

8. Disconnect the heater hose and bypass hose.

9. On 1987 vehicles with air conditioning, remove the air conditioning compressor pulley and field coil assembly, if necessary to remove the water pump to compressor front mount bolts and bracket.

10. Remove the remaining pump retaining bolts (if any) and remove the pump from the engine.

To install:

11. Clean and dry the pump mating surfaces. Install a new bypass hose to the engine.

12. Install a new gasket and install the water pump to the engine.

13. Install any bolts that do not retain a bracket. Tighten the bypass hose clamps. Install the heater hose.

14. Install the water pump to compressor front mount bolts and bracket, if it was removed.

15. Install all remaining brackets and components that were removed during the removal procedure. Torque all water pump retaining bolts that do not go through adjusting slots to 30 ft. lbs. (41 Nm).

16. Install the air conditioning compressor pulley and field coil assembly, if it was removed. Install and adjust the alternator/air conditioning or idler belts. Place the remaining belts over their components.

17. Install the fan blade, spacer or viscous drive unit, pulley and bolts along with the shroud.

18. Install the radiator, lower hose and shroud.

19. Adjust all belts and torque the remaining water pump retaining bolts to 30 ft. lbs. (41 Nm).

20. Fill the radiator with coolant. This cooling system is self-bleeding, so system bleeding is not required.

21. Connect the negative battery cable, run the vehicle until the thermostat opens, fill the radiator completely and check for leaks.

22. Once the vehicle has cooled, recheck the coolant level.

Thermostat**REMOVAL & INSTALLATION**

1. Disconnect the negative battery cable. Drain the coolant down to thermostat level or below.

2. Remove the thermostat housing.

3. Remove the thermostat and discard the gasket.

4. Clean the housing mating surfaces and use a new gasket.

5. The installation is the reverse of the removal procedure.

6. On 2.2L and 2.5L engines, remove the hex-head plug or vacuum switching valve on the thermostat housing. Fill the radiator with coolant until the coolant comes out the plug hole. Install the plug or valve and continue to fill the radiator. On the 3.3L engine, remove the engine temperature sending unit. Fill the radiator with coolant until the coolant comes out the sending unit hole. Install the sending unit and continue to fill the radiator. All other engines are self-bleeding.

7. Connect the negative battery cable, run the vehicle until the thermo-

Thermostat with air vent valve—2.6L and 3.0L engines

stat opens, fill the radiator completely and check for leaks.

8. Once the vehicle has cooled, recheck the coolant level.

COOLING SYSTEM BLEEDING

The thermostat in the 2.6L and 3.0L engines is equipped with a small air vent valve that allows trapped air to bleed from the system during refilling. This valve negates the need for cooling system bleeding in those engines. The 3.9L engine cooling system is also self-bleeding and does not require bleeding when refilling.

To bleed air from the 2.2L and 2.5L engines, remove the 8mm hex-head plug on the top of the thermostat housing (some carbureted engines have a vacuum switching valve at that location). On the 3.3L engine, remove the engine temperature sending unit. Fill the radiator with coolant until the coolant comes out the hole. Install the plug, valve or switch and continue to

fill the radiator. This will vent all trapped air from the engine.

FUEL SYSTEM

Fuel System Service Precaution

RELIEVING FUEL SYSTEM PRESSURE

Except 3.9L Engine

1. Loosen the fuel filler cap to release fuel tank pressure.
2. Locate the fuel injector harness connector.
3. Connect a jumper wire from ter-

minal No. 1 of the appropriate connector to ground.

4. Being careful not to allow contact between the jumper leads, connect a jumper wire to terminal No. 2 of the connector and touch the other end of the jumper to the positive battery post for no longer than 5 seconds. This will relieve fuel pressure.

5. Remove the jumper wires and connect the connector.

3.9L Engine

1. Loosen the fuel filler cap to release fuel tank pressure.

2. Locate the fuel injector harness connector.

3. Connect a jumper wire from either of the end pins in the connector to ground.

4. Being careful not to allow contact between the jumper leads, connect a jumper wire to the pin next to the one that is grounded and touch the other end of the jumper to the positive battery post for no longer than 5 seconds. This will relieve fuel pressure.

5. Remove the jumper wires and connect the connector.

Fuel Filter

REMOVAL & INSTALLATION

Carbureted Engine

1. Disconnect the negative battery cable.

2. Raise the vehicle and support safely, if necessary.

3. Remove the air cleaner assembly, if necessary. On 2.6L engine, remove the black carburetor bracket. Remove the fuel filter and any hoses that are included with the new filter kit.

NOTE: Some vehicles may be equipped with a field package designed to combat driveability problems associated with fuel foaming. Affected vehicles have a special replaceable filter/reservoir mounted either on a plate on the carburetor or near the thermostat. When the kit is installed on a 2.2L engine, the conventional filter is discarded. Do not install a conventional filter or conventional clamps or hoses in place of the special replacement parts; they are not compatible with the electronic fuel pump installed with the kit.

4. Install the new filter, hoses and clamps.

5. Connect the negative battery cable, start the engine and check for leaks.

Cooling system bleed plug—2.2L and 2.5L engines

Engine temperature sending unit—3.3L engine

Fuel injector harness connector location—2.5L non-turbocharged engine

Fuel Injected Engine

CAUTION

Do not use conventional fuel filters, hoses or clamps when servicing this fuel system. They are not compatible with the injection system and could fail, causing personal injury or damage to the vehicle. Use only hoses and clamps specifically designed for fuel injection.

1. Relieve the fuel pressure.
2. Disconnect the negative battery cable.
3. The filter is located on the frame rail toward the rear of the vehicle. Raise the vehicle and support safely. Remove the filter retaining screw and remove the filter assembly from the mounting plate.
4. Loosen the outlet hose clamp on the filter and inlet hose clamp on the rear fuel tube.

5. Wrap a shop towel around the hoses to absorb fuel. Remove the hoses from the filter and fuel tube and discard the clamps and the filter.

To install:

6. Install the inlet hose on the fuel tube and tighten the new clamp to 10 inch lbs.
7. Install the outlet hose on the filter outlet fitting and tighten the new clamp to 10 inch lbs.
8. Position the filter assembly on the mounting plate and tighten the mounting screw to 75 inch lbs. (8 Nm).
9. Connect the negative battery cable, start the engine and check for leaks.

Mechanical Fuel Pump

PRESSURE TESTING

1. Raise the vehicle and support safely.

2. Connect a pressure gauge (0–15 psi minimum range) to the fuel pump outlet fitting.

3. Crank the engine several times while observing the gauge.

4. The 2.2L and 2.6L engines should develop 4.5–6.0 psi. The 1987 3.9L engine should develop 5.75–7.25 psi. (1988–90 3.9L engines are equipped with an electric fuel pump). If the vehicle is equipped with the field package noted above, fuel pressure should be 13–15 psi.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Raise the vehicle and support safely, if necessary.
3. Disconnect the fuel lines from the pump and plug them.
4. Remove the fuel pump retaining bolts or nuts and remove the pump from the engine.
5. Clean and dry the mounting surfaces and bolt holes.
6. The installation is the reverse of the removal procedure. Use new gaskets and an insulator, if equipped.
7. Connect the negative battery cable, start the engine and check for leaks.

Electric Fuel Pump

PRESSURE TESTING

1. Relieve the fuel pressure.
2. Properly connect the fuel system pressure tester:
 - a. 2.5L non-turbocharged and 3.9L engines—special tool C-4799A, or equivalent is installed between the fuel supply hose and the engine fuel line assembly.
 - b. 3.0L engine—special tool C-4799A and adaptor 6433, or equivalent is installed between the fuel supply hose and the engine fuel line assembly.
 - c. 2.5L turbocharged and 3.3L engines—special tool C-4799A, or equivalent is installed to the fuel rail service valve.
3. With the key in the RUN position, put the DRB I or II in the activate auto shutdown relay mode; this will activate the fuel pump and pressurize the system.
4. If the pressure is within specifications, reinstall the fuel hose.
5. If fuel pressure is below specifications, install the tester in the fuel supply line between the tank and the filter and repeat the test.
6. If the pressure is 5 psi higher than in Step 5, replace the fuel filter. If no change is observed, squeeze the return hose. If pressure increases, re-

2 CHRYSLER MID SIZE CARAVAN/VOYAGER/TOWN & COUNTRY • DAKOTA

Fuel injector harness connector location—2.5L turbocharged engine

Fuel injector harness connector location—3.0L engine

Injector wiring harness connector—3.9L engine

place the pressure regulator. If no change is observed, the problem is either a plugged in-tank sock filter or a defective pump.

7. If fuel pressure is above specifications, remove the fuel return line hose from the chassis line at the fuel tank and connect a 3 foot piece of fuel hose to the return line. Put the other end into a 2 gallon minimum capacity approved gasoline container. Repeat the test. If pressure is now correct, check the in-tank return hose for kinking. Replace the fuel pump assembly if the in-tank reservoir check valve or aspirator jet is obstructed.

8. If pressure is still above specifications, remove the fuel return hose from the throttle body. Connect a substitute hose to the throttle body return nipple and place the other end of the hose in a clean container. Repeat the test. If pressure is now correct, check for a restricted fuel return line. If no change is observed, replace the fuel pressure regulator.

REMOVAL & INSTALLATION

Caravan, Voyager and Town & Country

1. Relieve the fuel pressure.
2. Disconnect the negative battery cable.
3. Raise the vehicle and support safely.
4. Using the proper equipment, drain the fuel tank.
5. Remove the screws that hold the filler neck to the quarter panel.
6. Disconnect the wiring and hoses from the tank.
7. Place a transmission jack or equivalent under the center of the tank and apply slight pressure. Remove the tank straps.
8. Lower the tank and remove the filler tube from the tank.
9. Lower the tank and disconnect the vapor separator rollover valve hose and remove the fuel tank from the vehicle.
10. Using a hammer and a brass drift, tap the lock ring counterclockwise to release the pump.
11. Partially pull the pump assembly out of the tank until the return line hose connection is visible at the of the pump assembly.
12. Disconnect the fuel fitting by pressing in on the ears.
13. Remove the pump from the tank with the O-ring. Discard the O-ring, pump inlet filter and inlet seal. Disassemble as required.
- To install:**
14. Install a new inlet seal and filter on the end of the pump.
15. Install a new O-ring to the pump.
16. Connect the reservoir hose to the

Fuel injector harness connector location—3.3L engine

Removing the fuel pump from the tank—Caravan, Voyager and Town & Country

Top of the fuel pump module—Dakota

pump assembly at the suction end of the pump. Press the female fitting onto the pump assembly male end until the ears snap in place.

17. Install the pump into the tank so the fuel return hose is not kinked.

18. Install the lock ring with a hammer and brass punch turning the ring clockwise.

19. Install the fuel tank.

20. Connect the negative battery cable, start the engine and check for leaks.

Dakota

1. Relieve the fuel pressure.

2. Disconnect the negative battery cable.

3. Raise the vehicle and support safely.

4. Using the proper equipment, drain the fuel tank.

5. Disconnect the vent hoses and filler hose from the tank and remove the hoses from the bracket attached to the top of the frame rail, if equipped.

6. Place a transmission jack or equivalent under the center of the tank and apply slight pressure.

7. Remove the retaining strap J-bolt nuts and remove the straps.

8. Lower the tank enough to reach in and disconnect the electrical connector and the remaining fuel tubes from the top of the module.

9. Lower the tank and remove the module. When the module is released from the tank it will spring up. Remove the pump from the module.

To install:

10. Clean the seal area of the tank. Install the new pump to the module so the filter is in the same position as before removal. Install a new O-ring on the module.

11. Align the module with the retaining bracket on the bottom of the tank. It is normal for the module to have a slight interference fit with the bracket.

12. Push the module down and install the retaining clamp.

13. Install the fuel tank.

14. Connect the negative battery cable, start the engine and check for leaks.

Carburetor

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. On 2.6L engine, drain the radiator because the choke control element is water activated.

2. Remove the air cleaner assembly.

3. Remove and install the fuel tank cap to relieve any pressure in the tank.

4. Matchmark all vacuum hoses

and electrical connectors and remove them from the carburetor.

5. Disconnect the throttle, cruise control, choke and kickdown cables and linkages, if equipped.

6. Disconnect and plug the fuel inlet line.

7. Remove the mounting bolts and/or nuts and remove the carburetor from the intake manifold.

To install:

8. Clean the mounting surface of the manifold and install a new base gasket.

9. Install the mounting bolts and/or nuts and tighten them alternately to compress the base gasket evenly.

10. Connect the fuel line.

11. Connect the throttle, cruise control, choke and kickdown cables and linkages, if equipped.

12. Install all vacuum hoses and electrical connectors in their proper locations.

13. Install the air cleaner.

14. Connect the negative battery cable, start the engine and perform all necessary adjustments.

IDLE SPEED ADJUSTMENT

2.2L Engine

1. Before checking or adjusting the idle speed, check ignition timing and adjust if necessary.

2. Disconnect and plug the vacuum connector at the coolant vacuum switch cold closed valve.

3. Unplug the connector at the radiator fan and install a jumper wire so the fan will run continuously.

4. Remove the PCV valve and allow it to draw underhood air.

5. Connect a tachometer to engine.

6. Ground the carburetor switch with a jumper wire.

7. Disconnect the oxygen system test connector located on left fender shield, if equipped.

8. Start and run the engine until normal operating temperature is reached.

9. If tachometer indicates rpm is not at specifications, turn the idle speed screw until correct idle speed is obtained. The screw is located on top of the solenoid mounted on the back of the carburetor.

10. Reconnect the PCV valve, oxygen connector and vacuum connector.

11. Remove jumper wire and reconnect the radiator fan.

12. After Steps 9 and 10 are completed, the idle speed may change slightly. This is normal and engine speed should not be readjusted.

13. Make sure the solenoid kicker moves the throttle blade adequately so the idle does not change when the air conditioning is working.

2.6L Engine

1. Start the engine and allow it to reach normal operating temperature. Before checking or adjusting the idle speed, check ignition timing and adjust if necessary.

2. Turn all lights and accessories **OFF**. Disconnect the radiator fan. Connect a tachometer to the engine.

3. Open the throttle and run at 2500 rpm for 10 seconds. Allow the engine to idle for 2 minutes.

4. Check the idle speed. If the tachometer indicates rpm is not at specifications, turn the idle speed screw until correct idle speed is obtained. The screw can be accessed through the hole in the front cover.

5. Once the idle speed is set, connect the radiator fan plug and turn the air conditioning on to its coldest position, if equipped.

6. With the compressor running, set the idle to 900 rpm by turning the idle-up screw. This screw can also be

accessed through the hole in the front cover.

3.9L Engine

1. Start the engine and run until at normal operating temperature. Check and adjust the ignition timing. Turn the engine **OFF**.

2. Disconnect and plug the EGR hose. Disconnect the oxygen sensor, if equipped.

3. Disconnect and plug the $\frac{3}{16}$ in. hose at the canister.

4. Remove the PCV hose from the valve cover and allow it to draw underhood air.

5. Ground the carburetor switch with a jumper wire, if equipped.

6. Disconnect the vacuum hose from the computer, if equipped and connect an auxiliary vacuum supply of 16 Hg in.

7. Make sure all accessories are off. Install a tachometer and start the engine.

Idle speed screw location—2.6L engine

Idle-up adjustment screw—2.6L engine

8. Allow the engine to run for 2 minutes to stabilize. Turn the idle speed screw until the correct idle speed according to the Vehicle Emission Control Information label is reached.

9. Connect all wires and hoses that were previously disconnected. It is normal for the idle speed to vary after all hoses and wires are reconnected; do not readjust.

IDLE MIXTURE ADJUSTMENT

1. Disconnect and plug the EGR hose. Disconnect the oxygen sensor, if equipped.

2. Disconnect and plug the $\frac{3}{16}$ in. hose at the canister.

3. Remove the PCV hose from the valve cover and allow it to draw underhood air.

4. Ground the carburetor switch with a jumper wire, if equipped.

5. Disconnect the vacuum hose from the computer, if equipped and connect an auxiliary vacuum supply of 16 Hg in.

6. Remove the concealment plug. Disconnect the vacuum supply hose to the tee and install a propane supply hose in its place.

7. Make sure all accessories are off. Install a tachometer and start the engine. Allow the engine to run for 2 minutes to stabilize.

8. Open the main propane valve. Slowly open the propane metering valve until the maximum engine rpm is reached. When too much propane is added, the engine will begin to stumble; at this point back off until the engine stabilizes.

9. Adjust the idle rpm to obtain the specified propane rpm. Fine tune the metering valve to obtain the highest rpm again. If there has been a change to the maximum rpm, readjust the idle screw to the specified propane rpm.

10. Turn the main propane valve off and allow the engine to run for 1 minute to stabilize.

11. Adjust the mixture screw to obtain the smoothest idle at the specified idle rpm.

12. Open the main propane valve. Fine tune the metering valve to obtain the highest rpm. If the maximum engine speed is more than 25 rpm different than the specified propane rpm, repeat the procedure.

13. Turn the propane valves off and remove the propane canister. Reinstall the vacuum supply hose to the tee.

14. Perform the idle speed adjustment procedure.

15. Connect all wires and hoses that were previously disconnected.

SERVICE ADJUSTMENTS

For all carburetor service adjustment procedures and Specifications, please refer to "Carburetor Service" in the Unit Repair section.

Fuel Injection

IDLE SPEED ADJUSTMENT

Except 3.9L Engine

The idle speed is controlled by the automatic idle speed motor (AIS) which is controlled by the logic module. The logic module receives data from various sensors and switches in the system and adjusts the engine idle to a predetermined speed. Idle speed specifications can be found on the Vehicle Emission Control Information (VECI) label located in the engine compartment. If the idle speed is not within specifications and there are no problems with the system, the throttle body should be replaced.

3.9L Engine

1. Start the engine and allow it to reach normal operating temperature. If it is already hot, run it for 2 minutes.

2. Turn the engine off and allow 1 minute for the Idle Speed Control (ISC) actuator shaft to fully extend.

3. Disconnect the ISC actuator connector and the coolant temperature sensor.

4. Connect a tachometer to the engine and start the engine.

5. Adjust the extension screw on the actuator shaft until the rpm is within specifications.

6. Turn the engine off. Reconnect the ISC actuator connector and the

coolant temperature sensor. Remove the tachometer.

IDLE MIXTURE ADJUSTMENT

There is no idle mixture adjustment provided with any Chrysler fuel injection system.

Fuel Injector

REMOVAL & INSTALLATION

2.5L Non-Turbocharged Engine and 3.9L Engine

1. Remove the air cleaner assembly.
2. Relieve the fuel pressure.
3. Disconnect the negative battery cable.

NOTE: On the 3.9L engine, there is a small spacer below the injector hold-down clamp. Take the proper precaution to prevent this spacer from falling into the throttle body.

4. Remove the injector hold-down Torx® screw, the hold-down and the spacer.

5. Using a small flat-tipped tool, lift the cap off of the injector.

6. Using the same tool, gently pry the injector from its pod.

7. Remove the lower O-ring from the pod.

To install:

8. Install the new lower O-ring on the injector.

9. Align the injector terminal housing with the locating socket in the injector cap.

10. Press the injector cap so that the upper O-ring flange is flush with the lower surface of the cap.

Adjusting the Idle speed — 3.9L engine

Injector hold-down and spacer—3.9L engine

Installing the injector to the cap—2.5L non-turbocharged and 3.9L engines

Fuel injector removal and installation—2.5L turbocharged engine

11. Spray the inner surfaces of the injector pod with suitable carburetor parts cleaner to remove residual varnish and gasoline.

12. Lubricate the O-rings sparingly with unmedicated petroleum jelly.

13. Place the injector and cap into the injector pod and align the cap locating pin with the locating hole in the casting. On the 3.9L engine, the right side locating pin is 5mm in diameter and will not fit into the other hole. The left side pin is 4mm in diameter and will be loose in the other hole.

14. Press firmly on the injector cap until it is flush with the casting surface.

15. Install the spacer, if equipped and align the holes in the hold-down with the pins on the caps and install.

16. Push down on the caps, install the screw and torque to 35 inch lbs. (4 Nm).

17. Connect the negative battery cable and check for leaks using the DRB I or II to activate the fuel pump.

18. Install the air cleaner.

2.5L Turbocharged Engine

1. Relieve the fuel pressure.

2. Disconnect the negative battery cable.

3. Disconnect the injector wiring connector from the injector.

4. Unbolt the fuel rail from the rear of the engine. Position the fuel rail assembly so the fuel injectors are easily accessible.

5. Remove the injector clip from the fuel rail and injector. Pull the injector straight out of the fuel rail receiver cup.

6. Check the injector O-ring for damage. If the O-ring is damaged, replace it. If the injector is being reused, install a protective cap on the injector tip to prevent damage.

7. Repeat the procedure for the remaining injectors.

To Install:

8. Before installing an injector the rubber O-ring should be lubricated with a drop of clean engine oil to aid in installation.

9. Install injector top end into fuel rail receiver cup.

10. Install injector clip by sliding the open end into top slot of the injector and onto the receiver cup ridge into the side slots of clip.

11. Repeat the steps for the remaining injectors.

12. Install the fuel rail.

13. Connect the negative battery cable and check for leaks using the DRB I or II to activate the fuel pump.

3.0L Engine

1. Relieve the fuel pressure.

2. Disconnect the negative battery cable.

3. Remove the air cleaner to throttle body hose.

4. Disconnect the throttle cable from the throttle body and disconnect the kickdown linkage. Remove the throttle cable bracket attaching bolts.

5. Disconnect the connectors to the throttle body.

6. Matchmark and carefully remove the vacuum hoses from the throttle body.

7. Remove the PCV and brake booster hoses from the air intake plenum.

8. Remove the ignition coil from the intake plenum, if it is mounted there.

9. Remove the EGR tube flange from the intake plenum, if equipped.

10. Unplug the coolant temperature sensor and charge temperature sensor, if equipped.

11. Remove the vacuum connection from the air intake plenum vacuum connector.

12. Remove the fuel hoses from the fuel rail and plug them.

13. Remove the air intake plenum to intake manifold bolts and remove the plenum and gaskets. Cover the intake manifold openings.

14. Remove the vacuum hoses from the fuel rail.

15. Disconnect the fuel injector wiring harness.

16. Remove the fuel rail attaching bolts and remove the fuel rail with the wiring harness from the vehicle. Position the rail on the bench upside down so the injectors are easily accessible.

17. Remove the small connector retainer clip and unplug the injector. Remove the injector clip off the fuel rail and injector. Pull the injector straight out of the rail.

To install:

18. Lubricate the rubber O-ring with clean oil and install to the rail receiver cap. Install the injector clip to the **TOP** slot of the injector, plug in the connector and install the connector clip.

19. Install the fuel rail to the vehicle and plug in the injector harness. Connect the vacuum hoses to the fuel rail.

20. Install new intake plenum gaskets with the beaded sealer side up and install the intake plenum. Torque the attaching bolts and nuts to 115 inch lbs. (13 Nm).

21. Install the fuel hoses to the fuel rail.

22. Install or connect all items that were removed or disconnected from the intake plenum and throttle body.

23. Connect the negative battery cable and check for leaks using the DRB I or II to activate the fuel pump.

Fuel rail assembly—3.0L engine

Fuel rail installed—3.3 L engine

3.3L Engine

1. Relieve the fuel pressure.
2. Disconnect the negative battery cable.

3. Remove the air cleaner and hose assembly.

4. Disconnect the throttle cable. Remove the wiring harness from the throttle cable bracket and intake manifold water tube.

5. Remove the vacuum hose harness from the throttle body.

6. Remove the PCV and brake booster hoses from the air intake plenum.

7. Remove the EGR tube flange from the intake plenum, if equipped.

8. Unplug the charge temperature sensor and unplug all vacuum hoses from the intake plenum.

9. Remove the cylinder head to intake plenum strut.

10. Disconnect the MAP sensor and

oxygen sensor connector. Remove the engine mounted ground strap.

11. Release the fuel hose quick disconnect fittings and remove the hoses from the fuel rail. Plug the hoses.

12. Remove the Direct Ignition System (DIS) coils and the alternator bracket to intake manifold bolt.

13. Remove the intake manifold bolts and rotate the manifold back over the rear valve cover. Cover the intake manifold.

14. Remove the vacuum harness from the pressure regulator.

15. Remove the fuel tube retainer bracket screw and fuel rail attaching bolts. Spread the retainer bracket to allow for clearance when removing the fuel tube.

16. Remove the fuel rail injector wiring clip from the alternator bracket.

17. Disconnect the cam sensor, coolant temperature sensor and engine temperature sensor.

18. Remove the fuel rail.
19. Position the rail on the bench so the injectors are easily accessible.
20. Remove the small connector retainer clip and unplug the injector. Remove the injector clip off the fuel rail and injector. Pull the injector straight out of the rail.

To install:

21. Lubricate the rubber O-ring with clean oil and install to the rail receiver cap. Install the injector clip to the slot in the injector, plug in the connector and install the connector clip.
22. Install the fuel rail.
23. Connect the cam sensor, coolant temperature sensor and engine temperature sensor.
24. Install the fuel rail injector wiring clip to the alternator bracket.
25. Install the fuel rail attaching bolts and fuel tube retainer bracket screw.
26. Install the vacuum harness to the pressure regulator.
27. Install the intake manifold with a new gasket. Install the bolts only fingertight. Install the alternator bracket to intake manifold bolt and the cylinder head to intake manifold strut and bolts. Torque the intake manifold mounting bolts to 21 ft. lbs. (28 Nm) starting from the middle and working outward. Torque the bracket and strut bolts to 40 ft. lbs. (54 Nm).
28. Install or connect all items that were removed or disconnected from the intake manifold and throttle body.
29. Connect the fuel hoses to the rail. Push the fittings in until they click in place.
30. Install the air cleaner assembly.
31. Connect the negative battery cable and check for leaks using the DRB I or II to activate the fuel pump.

EMISSION CONTROLS

Please refer to "Emission Control" in the Unit Repair section for system maintenance procedures. Due to the complex nature of modern electronic engine control systems, comprehensive diagnosis and testing procedures fall outside the confines of this repair manual. For complete information on diagnosis, testing and repair procedures concerning all modern engine and emission control systems, please refer to "Chilton's Guide to Electronic Engine Controls".

Emission Warning Lamps

RESETTING

1986-88 Vehicles

1. Locate the EMR switch module. It is a plastic box located either on the lower portion of the steering column or to the left of the steering column.
2. Remove the 9 volt battery (under the small black panel) from the module. Some 1988 vehicles do not have the 9 volt battery.
3. Reset the switch by inserting a small rod into a hole in the case of the module, which closes a switch and turns the lamp off.
4. Install a new 9 volt battery, if equipped.

1989-90 Vehicles

1. Connect the DRBII to the diagnostic connector.
2. Turn the ignition switch to the RUN position and access the Emissions EMR Tests on the DRBII.
3. Select EMR Memory Check.
4. Select Reset EMR Light. This will reset the EMR timing in the computer and turn the light off.
5. Disconnect the DRBII.

ENGINE MECHANICAL

NOTE: Disconnecting the negative battery cable on some vehicles may interfere with the functions of the on board computer systems and may require the computer to undergo a relearning process, once the negative battery cable is reconnected.

Engine

REMOVAL & INSTALLATION

Caravan, Voyager and Town & Country

2.2L AND 2.5L ENGINES

1. If equipped with fuel injection, relieve the fuel pressure. Disconnect the negative battery cable and all engine ground straps.
2. Mark the hood hinge outline on the hood and remove the hood.
3. Drain the cooling system. Remove the radiator hoses, fan assembly, radiator shroud and radiator.
4. Remove the air cleaner, duct hoses and oil filter.

5. Unbolt the air conditioning compressor from its mount, if equipped and position it to the side.

6. Remove the power steering pump mounting bolts and position the pump to the side, without disconnecting any fluid lines.

7. Label and disconnect all electrical connectors from the engine, alternator and carburetor or fuel injection system.

8. Disconnect the fuel line, heater hoses and accelerator linkage.

9. Disconnect the air pump lines and remove the pump, if equipped.

10. Remove the alternator.

11. Disconnect the shift linkage(s), clutch linkage (as required) and speedometer cable.

12. Raise the vehicle and support safely. Disconnect the exhaust pipe from the manifold. Remove the right inner fender shield.

13. If equipped with a manual transaxle, remove the transaxle.

14. If equipped with an automatic transaxle, perform the following procedures:

- a. Remove the lower cover from the transaxle case.

- b. Remove the exhaust pipe-to-exhaust manifold bolts. Separate the pipe from the manifold.

- c. Remove the starter and set it aside.

- d. Matchmark the flex plate to the torque converter, for installation purposes.

- e. Remove the torque converter bolts. Separate the converter from the flex plate. Remove the lower bellhousing bolts.

15. Lower the vehicle and support the transaxle (if still in the vehicle) with a floor jack or equivalent. Attach an engine lifting device to the engine.

16. To lower the engine, separate the right side engine bracket from the yoke bracket. To raise the engine, remove the yoke/insulator long bolt.

NOTE: If removing the insulator-to-rail screws, first mark the position of the insulator on the side rail to insure proper alignment during reinstallation.

17. Remove the remaining bellhousing bolts. Remove the front engine mount nut/bolt and the left insulator through bolt or the insulator bracket-to-transaxle bolts.

18. Lift the engine from the vehicle and remove.

To Install:

19. Lower the engine into the engine compartment. Loosely install all of the mounting bolts. With all bolts installed, torque the:

Engine to mount bolts to 40 ft. lbs.

Engine to transaxle bolts to 70 ft. lbs.

Torque converter bolts to 40 ft. lbs.
20. Connect or install all items disconnected or removed during the removal procedure. Fill the engine with the proper amount of engine oil.

21. Refill the cooling system. Start the engine, allow it to reach normal operating temperature. Check for leaks. Check the ignition timing and adjust if necessary. Adjust the idle speed/mixture (if possible) and the transaxle linkage.

2.6L, 3.0L AND 3.3L ENGINES

1. If equipped with fuel injection, relieve the fuel pressure. Disconnect the negative battery cable.

2. Matchmark the hinge-to-hood position and remove the hood.

3. Drain the cooling system. Disconnect and label all engine electrical connections.

4. Remove the coolant hoses from the radiator and engine. Remove the radiator and cooling fan assembly.

5. Remove the air cleaner assembly. Disconnect the fuel lines from the engine. Disconnect the accelerator cable from the engine.

6. Raise the vehicle and support safely. Drain the engine oil.

7. Remove the air conditioning compressor mounting bolts, the drive belt(s) and position the compressor to the side. Disconnect the exhaust pipe from the exhaust manifold.

8. Remove the transaxle inspection cover, matchmark the converter to the flexplate and remove the torque converter bolts.

9. Remove the power steering pump mounting bolts and set the pump aside, upright, with the fluid lines attached.

10. Remove the lower bellhousing bolts. Disconnect and label the starter motor wiring and remove the starter motor from the engine.

11. Lower the vehicle. Disconnect and label the vacuum hoses and engine ground straps.

12. Support the transaxle with a floor jack or equivalent. Attach an engine lifting device to the engine.

13. Remove the upper transaxle-to-engine bolts.

14. To separate the engine mounts from the insulators, mark the right insulator-to-right frame support and remove the mounting bolts. Remove the front engine mount through bolt. Remove the left insulator through bolt, from inside the wheel housing. Remove the insulator bracket-to-transaxle bolts.

15. Lift and remove the engine from the vehicle.

To Install:

16. Lower the engine into the engine compartment. Align the engine

mounts and install the bolts; do not tighten the bolts until all bolts have been installed. Torque the through bolts to 75 ft. lbs.

17. Install the upper transaxle-to-engine mounting bolts and torque to 75 ft. lbs. Remove the engine lifting fixture from the engine.

18. Raise the vehicle and support safely.

19. Align the converter marks, install the torque converter bolts. Install the transaxle inspection cover.

20. Connect the exhaust pipe to the exhaust manifold. Install the starter motor and connect the wiring.

21. Install the power steering pump and air conditioning compressor. Adjust the drive belt tension, if necessary.

22. Lower the vehicle. Reconnect all vacuum hoses and electrical connections to the engine.

23. Connect the fuel lines and accelerator cable.

24. Install the radiator and fan assembly. Connect the fan motor wiring. Connect the radiator hoses and refill the cooling system.

25. Refill the engine with the proper oil to the correct level.

26. Connect the engine ground straps. Install the hood and align the matchmarks. Connect the battery.

27. Start and run the engine until it reaches normal operating temperatures and check for leaks. Adjust the transaxle linkage, if necessary.

Dakota

1. Relieve the fuel pressure if the vehicle is equipped with fuel injection. Disconnect the negative battery cable from the battery and from the engine.

2. Remove the hood and the oil dipstick.

3. Raise the vehicle and support safely. Drain the engine oil and coolant. Remove the lower radiator hose.

4. Remove the starter. Remove the

engine to transmission struts, if equipped.

5. Remove the exhaust pipe from the exhaust manifold(s).

6. If the vehicle is equipped with a manual transmission, remove the transmission and all related parts.

7. If the vehicle is equipped with an automatic transmission, remove the inspection plate, matchmark the flex plate to the converter, remove the torque converter bolts and push the torque converter backwards as far as it will go. Remove the lower bell housing bolts.

8. If the vehicle is 2WD, remove the engine mount lower nuts.

9. If the vehicle is equipped with 4WD:

a. On the left side, remove the 2 bolts attaching the bracket to the transmission bellhousing and 2 bracket to pinion nose adaptor bolts. Separate the engine from the insulator by removing the upper nut washer assembly and through-bolt from the engine support bracket.

b. On the right side, remove the 2 bracket to axle Disconnect housing bolts and 1 bracket to bellhousing bolt. Separate the engine from the insulator by removing the upper nut washer assembly and the through-bolt from the engine support bracket.

10. Disconnect and plug the rubber fuel inlet and return hoses from the fuel lines at the front of the vehicle. Lower the vehicle.

11. Remove the air cleaner assembly and disconnect all linkages and cables. On the 3.9L engine, remove the carburetor or throttle body. Stuff a clean shop towel into the intake manifold opening to prevent foreign objects from entering.

12. Unbolt the compressor from the engine and position it to the side.

13. Remove the radiator and shroud. Remove the fan and all related parts.

Interconnected motor mounts — Dakota with 4WD

14. Unbolt the power steering pump brackets from the engine and position it to the side.

15. Remove the alternator, air pump and all brackets. Disconnect the heater hoses.

16. Remove the distributor cap with all spark plug wires attached. Disconnect all remaining electrical connectors, vacuum hoses and check for any other items preventing engine removal.

17. Attach an engine removal device to the intake manifold or cylinder head.

18. If the vehicle is equipped with an automatic transmission, support the transmission with a floor jack, or equivalent. Remove the remaining bell housing bolts.

19. Remove the engine from the vehicle slowly and carefully.

To install:

20. Lower the engine into position and install the engine mount bolts on the 2.5L engine. Install the upper bell housing bolts. Remove the engine removal device. Install the oil dipstick.

21. Raise the vehicle and support safely.

22. On 3.9L engine, install the engine mount and interconnect nuts and bolts. Install the remaining bell housing bolts.

23. If the vehicle is equipped with a manual transmission, install the transmission and all related parts.

24. If the vehicle is equipped with an automatic transmission, align the torque converter and flex plate and install the bolts. Install the inspection plate, starter and the engine to transmission struts, if equipped.

25. Connect the rubber fuel inlet and return hoses to the fuel lines at the front of the vehicle.

26. Install the exhaust pipe to the exhaust manifold(s). Install the lower radiator hose. Lower the vehicle.

27. Connect the heater hoses.

28. Make sure the negative battery cable is not connected to the battery. Connect the engine side of the negative cable to the engine. Install the alternator, air pump, power steering pump and all brackets.

29. Install the air conditioning compressor.

30. Install the throttle body or carburetor using a new base gasket and connect all linkages and cables. Connect all electrical connectors, vacuum hoses, etc. that were disconnected during the engine removal procedure.

31. Install the fan and all related parts. Adjust all belt tensions.

32. Install the radiator and shroud.

33. Install the distributor cap with all spark plug wires attached.

34. Install the air cleaner assembly.

35. Install the hood.

36. Fill the engine with the specified amount of oil and fill the radiator with coolant.

37. Connect the negative battery cable and set all adjustments to specification.

Cylinder Head

REMOVAL & INSTALLATION

2.2L and 2.5L Engines

1. Relieve the fuel pressure if equipped with fuel injection. Disconnect the negative battery cable and unbolt it from the head. Drain the cooling system. Remove the dipstick bracket nut from the thermostat housing.

2. Remove the air cleaner assembly. Remove the upper radiator hose and disconnect the heater hoses.

3. Disconnect and label the vacuum lines, hoses and wiring connectors from the manifold(s), carburetor or throttle body and from the cylinder head. Remove the air pump, if equipped.

4. Disconnect the all linkages and the fuel line from the carburetor or throttle body. Unbolt the cable bracket. Remove the ground strap attaching screw from the firewall.

5. If equipped with air conditioning, remove the upper compressor mounting bolts. The cylinder head can be removed with the compressor and bracket still mounted. Remove the upper part of the timing belt cover.

6. Raise the vehicle and support safely. Disconnect the converter from the exhaust manifold. Disconnect the water hose and oil drain from the turbocharger, if equipped.

7. Rotate the engine by hand, until the timing marks align (No. 1 piston at TDC). Lower the vehicle.

8. With the timing marks aligned, remove the camshaft sprocket. The camshaft sprocket can be suspended to keep the timing intact. Remove the spark plug wires from the spark plugs.

9. Remove the valve cover and cur-

tain, if equipped. Remove the cylinder head bolts and washers, starting from the middle and working outward.

10. Remove the cylinder head from the engine.

NOTE: Before disassembling or repairing any part of the cylinder head assembly, identify factory installed oversized components. To do so, look for the tops of the bearing caps painted green and O/SJ stamped rearward of the oil gallery plug on the rear of the head. In addition, the barrel of the camshaft is painted green and O/SJ is stamped onto the rear end of the camshaft. Installing standard sized parts in an head equipped with oversized parts—or visa versa—will cause severe engine damage.

11. Clean the cylinder head gasket mating surfaces.

12. Using new gaskets and seals, install the head to the engine. Using new head bolts assembled with the old washers, torque the cylinder head bolts in sequence, to 45 ft. lbs. Repeating the sequence, torque the bolts to 65 ft. lbs. With the bolts at 65 ft. lbs., turn each bolt an additional ¼ turn.

NOTE: Head bolt diameter for 1986-90 vehicles is 11mm. These bolts are identified with the number 11 on the head of the bolt. The 10mm bolts used on previous vehicles will thread into an 11mm bolt hole, but will permanently damage the cylinder block. Make sure the correct bolts are being used when replacing old head bolts.

13. Install the timing belt.

14. Install or connect all items that were removed or disconnected during the removal procedure.

15. Refill the cooling system. Connect the negative battery cable. Start the engine and check for leaks.

Cylinder head bolt torque sequence—2.2L and 2.5L engines

2.6L Engine

1. Disconnect the negative battery cable and unbolt it from the head.

2. Drain the cooling system. Remove the upper radiator hose and disconnect the heater hoses. Remove the air cleaner assembly.

3. Remove the dipstick bracket bolt from the thermostat housing.

4. Remove the carburetor to valve cover bracket. Remove the valve cover. Remove and plug the fuel lines to the carburetor.

5. Matchmark the distributor gear to its drive gear and remove the distributor. Remove the camshaft bolt and remove the distributor drive gear. Remove the camshaft gear with the chain installed from the camshaft and allow to rest on the holder just below it. This will not upset the valve timing. Do not crank the engine until the distributor has been reinstalled or the timing will be lost and timing components could be damaged.

6. Remove the water pump drive pulley retaining bolt and remove the pulley from the camshaft.

7. Disconnect and label the vacuum lines, hoses and wiring connectors from the manifold(s), carburetor and cylinder head. Since some of the vacuum lines from the carburetor connect to a solenoid pack on the right side inner fender, unbolt the solenoids from the fender with the vacuum lines attached and fold the assembly over the carburetor.

8. Disconnect all the linkages and the fuel line from the carburetor. Remove the ground strap attaching screw from the firewall. Unbolt the power steering pump from the bracket and position to the side.

9. Raise the vehicle and support safely. Disconnect the vacuum hoses from the source below the carburetor and disconnect the air feeder tubes.

10. Remove the exhaust pipe from the exhaust manifold. Lower the vehicle.

11. Remove the small end bolts from the head first, then remove the remaining head bolts, starting from the outside and working inward.

12. Remove the cylinder head from the engine.

13. Clean the cylinder head gasket mating surfaces.

To install:

14. Install a new head gasket to the block and install all head bolts and washers. Torque the bolts in sequence to 34 ft. lbs. (40 Nm). Repeat the sequence increasing the torque to 69 ft. lbs. (94 Nm). Tighten the small end bolts to 13 ft. lbs. (18 Nm).

15. Install the camshaft gear with the timing chain. If the timing will not allow for gear installation, reach into

69 FT. LBS. (94 NM) COLD ENGINE

75 FT. LBS. (103 NM) HOT ENGINE

Cylinder head bolt torque sequence—2.6L engine

the case with a long, thin tool and push the rubber foot into the oil pump to allow for more chain movement. Install the distributor drive gear, bolt and washer. Torque the bolt to 40 ft. lbs. (54 Nm). Install the distributor, aligning the matchmarks.

16. Install or connect all items that were removed or disconnected during the removal procedure.

17. Refill the cooling system. Connect the negative battery cable. Start the engine and check for leaks. Adjust the timing as required.

3.0L Engine

1. Relieve the fuel pressure. Disconnect the negative battery cable. Drain the cooling system.

2. Remove the drive belt and the air conditioning compressor from its mount and support it aside. Using a ½ in. drive breaker bar, insert it into the square hole of the serpentine drive belt tensioner, rotate it counterclockwise (to reduce the belt tension) and remove the belt. Remove the alternator and power steering pump from the brackets and move them aside.

3. Raise the vehicle and support safely. Remove the right front wheel assembly and the right inner splash shield.

4. Remove the crankshaft pulleys and the torsional damper.

5. Lower the vehicle. Using a floor jack and a block of wood positioned under the oil pan, raise the engine slightly. Remove the engine mount bracket from the timing cover end of the engine and the timing belt covers.

6. To remove the timing belt, perform the following procedures:

a. Rotate the crankshaft to position the No. 1 cylinder on the TDC of its compression stroke; the crankshaft sprocket timing mark should align with the oil pan timing indicator and the camshaft sprockets timing marks (triangles) should align with the rear timing belt covers timing marks.

b. Mark the timing belt in the direction of rotation for reinstallation purposes.

c. Loosen the timing belt tensioner and remove the timing belt.

NOTE: When removing the timing belt from the camshaft sprocket, make sure the belt does not slip off of the other camshaft sprocket. Support the belt so it can not slip off of the crankshaft sprocket and opposite side camshaft sprocket.

7. Remove the air cleaner assembly. Label and disconnect the spark plug wires and the vacuum hoses.

8. Remove the valve cover.

9. Install auto lash adjuster retainers (tool MD998443 or equivalent) on the rocker arms.

10. If removing the right cylinder head, matchmark the distributor rotor to the distributor housing and the housing to distributor extension locations. Remove the distributor and the distributor extension.

11. Remove the camshaft bearing assembly to cylinder head bolts (do not remove the bolts from the assembly). Remove the rocker arms, rocker shafts and bearing caps as an assembly, as required. Remove the camshafts from the cylinder head and inspect them for damage, if necessary.

12. Remove the intake manifold assembly.

13. Remove the exhaust manifold.

14. Remove the cylinder head bolts starting from the outside and working inward. Remove the cylinder head from the engine.

15. Clean the gasket mounting surfaces and check the heads for warpage; the maximum warpage allowed is 0.008 in. (0.20mm).

To install:

16. Install the new cylinder head gaskets over the dowels on the engine block.

17. Install the cylinder heads on the engine and torque the cylinder head

Cylinder head bolt torque sequence—3.0L engine

bolts in sequence using 3 even steps, to 70 ft. lbs. (95 Nm).

18. Install or connect all items that were removed or disconnected during the removal procedure.

19. When installing the timing belt over the camshaft sprocket, use care not to allow the belt to slip off the opposite camshaft sprocket.

20. Make sure the timing belt is installed on the camshaft sprocket in the same position as when removed.

21. Refill the cooling system. Connect the negative battery cable. Start the engine and check for leaks using the DRB I or II to active the fuel pump. Adjust the timing as required.

3.3L Engine

1. Relieve the fuel pressure. Disconnect the negative battery cable. Drain the cooling system.

2. Remove the intake manifold with throttle body.

3. Disconnect the coil wires, sending unit wire, heater hoses and bypass hose.

4. Remove the closed ventilation system, evaporation control system and cylinder head cover.

5. Remove the exhaust manifold.

6. Remove the rocker arm and shaft assemblies. Remove the pushrods and identify them in ensure installation in their original positions.

7. Remove the head bolts and remove the cylinder head from the block.

To install:

8. Clean the gasket mounting surfaces and install a new head gasket to the block.

9. Install the head to the block. Before installing the head bolts, inspect them for stretching. Hold a straight

edge up to the threads. If the threads are not all on line, the bolt is stretched and should be replaced.

10. Torque the bolts in sequence to 45 ft. lbs. (61 Nm). Repeat the sequence and torque the bolts to 65 ft. lbs. (88 Nm). With the bolts at 65 ft. lbs., turn each bolt an additional $\frac{1}{4}$ turn.

11. Torque the lone head bolt to 25 ft. lbs. (33 Nm) after the other 8 bolts have been properly torqued.

12. Install the pushrods, rocker arms and shafts and torque the bolts to 21 ft. lbs. (12 Nm).

13. Place a drop of silicone sealer onto each of the 4 manifold to cylinder head gasket corners.

CAUTION

The intake manifold gasket is composed of very thin and sharp metal. Handle this gasket with care or damage to the gasket or personal injury could result.

14. Install the intake manifold gasket and torque the end retainers to 105 inch lbs. (12 Nm).

15. Install the intake manifold and torque the bolts in sequence to 10 inch lbs. Repeat the sequence increasing the torque to 17 ft. lbs. (23 Nm) and recheck each bolt for 17 ft. lbs. of torque. After the bolts are torqued, inspect the seals to ensure that they have not become dislodged.

16. Lubricate the injector O-rings with clean oil and position the fuel rail in place. Install the rail mounting bolts.

17. Install the valve cover with a new gasket. Install the exhaust manifold.

18. Install or connect all remaining

Checking the head bolt for stretching

Cylinder head bolt torque sequence—3.3L engine

items that were removed or disconnected during the removal procedure.

19. Refill the cooling system. Connect the negative battery cable. Start the engine and check for leaks using the DRB I or II to activate the fuel pump.

3.9L Engine

1. Relieve the fuel pressure if the vehicle is equipped with fuel injection. Disconnect the negative battery cable from the battery and drain the cooling system.

2. Raise the vehicle and safely support. Disconnect the exhaust pipe from the manifolds.

3. Remove the alternator if the right head is being removed and the air pump and battery ground cable if the left head is being removed.

4. Remove the air cleaner assembly. Unbolt the air conditioning compressor and lay it to the side, if equipped. Remove the distributor cap with all wires attached.

5. Disconnect all wires, hoses, linkages and cables from the carburetor or throttle body. Disconnect and plug the fuel line.

6. Disconnect the ignition coil, coolant temperature sending unit wire and all other connectors along the wiring harness connected to items on the intake manifold.

7. Disconnect the heater hose, upper radiator hose and the lower bypass hose clamp.

8. Remove the valve covers.

9. Remove the intake manifold assembly. Remove the exhaust manifolds.

10. Remove the rocker arm and shaft assembly from the heads. Do not disassemble unless service is required.

11. Remove the pushrods and identify them to ensure installation in their original locations.

12. Remove the head bolts and remove the cylinder head(s).

To install:

13. Clean and dry all gasket surfaces of the cylinder block and head. Inspect all surfaces with a straightedge. If the flatness exceeds 0.0075 times the length of the span measured (in any direction), replace or machine the head gasket surface.

14. Using no sealer whatsoever, install the new head gasket(s) to the block. Clean, dry and lightly oil all head bolts threads. Install the heads and install the head bolts.

15. Torque the head bolts in sequence to 50 ft. lbs. (68 Nm). Repeat the sequence retightening the bolts to a final torque of 105 ft. lbs. (143 Nm) and repeat the second step to ensure all bolts are accurately torqued.

16. Assemble the rocker shaft assembly,

if it was serviced. Make sure all rocker arms with an RH stamped on them are installed to the right of those with an LH. Install the pushrods, rocker arms and shaft(s) with the notch on the end of the shaft pointing to the engine centerline and to the rear of the right bank or to the front of the left bank. Make sure the long stamped steel retainers are at the number 2 and 4 positions. Torque the bolts evenly and gradually to 17 ft. lbs. (23 Nm).

17. Clean and dry the intake manifold contact surfaces. Coat the intake manifold side gaskets very lightly with sealer and install the gaskets to the heads. Cutouts at the front of the gaskets differentiate the right and left sides.

18. Apply a thin uniform coat of quick dry cement to the front and rear intake manifold gaskets and mounting surfaces on the block and apply a thin bead of sealer to each of 4 the corners. Install the front and rear gaskets engaging the hole in the block and the tangs from the head gaskets. Apply a second thin bead of sealer above the gaskets in the 4 corners.

19. Carefully lower the intake manifold into position engaging the bypass hose; after it is satisfactorily in place, inspect the gaskets to make sure they have not become dislodged.

20. Install the intake manifold bolts and torque in sequence to 25 ft. lbs. (34 Nm). Repeat the sequence retightening the bolts to a final torque of 40 ft. lbs. (54 Nm) and repeat the second step to ensure all bolts are accurately torqued.

21. Install the exhaust manifold(s) and torque the bolts to 20 ft. lbs. (27 Nm). Torque the end nuts to 15 ft. lbs. (20 Nm).

22. Clean and dry the valve cover mating surfaces, bolts and bolt holes. Install the valve covers each with a new gasket.

Cylinder head bolt torque sequence—3.9 L engine

23. Connect the heater hose, upper radiator hose and the lower bypass hose clamp.

24. Connect the ignition coil, coolant temperature sending unit wire and all other connectors that were disconnected along the wiring harness.

25. Install the air conditioning compressor, if equipped. Install the distributor cap and all spark plug wires.

26. Install the alternator, battery ground and air pump, if they were removed.

27. Connect all wires, hoses, cables and the fuel line to the carburetor or throttle body. Install the air cleaner assembly.

28. Raise the vehicle and safely support. Connect the exhaust pipe to the manifolds.

29. Fill the cooling system.

30. Connect the negative battery cable and set all adjustments to specification.

Valve Lash

ADJUSTMENT

2.6L Engine

1. Run the engine until at normal operating temperature. Remove the valve cover.

2. In sequence, check that the head bolts are torqued to 75 ft. lbs. (103 Nm).

3. Position the piston at TDC on the compression stroke.

4. Loosen the valve adjuster locknut.

5. Adjust the valve clearance by turning the adjusting screw a little at a time while measuring the clearance with a feeler gauge.

6. The specifications on a hot engine are:

Intake—0.006 in. (0.15mm)

Exhaust—0.010 in. (0.25mm)

Rocker shafts/arms assembly—2.6L engine

7. Tighten the locknut securely while holding the adjustment screw stationary. Recheck the clearance after the locknut has been tightened.

8. Repeat the procedure for the remaining valves.

9. Install the valve cover with a new gasket.

Rocker Arms and Shafts

REMOVAL & INSTALLATION

2.2L and 2.5L Engines

1. Disconnect the negative battery cable.

2. Remove the valve cover.

3. Rotate the crankshaft until the low point of the desired cam lobe is contacting the rocker arm.

4. Use the special valve spring compressor tool, or equivalent, depress the valve spring (without dislodging the keepers) and slide the rocker arm out.

5. The installation is the reverse of the removal procedure.

2.6L Engine

1. Disconnect the negative battery cable.

2. Remove the valve cover.

3. Tighten the water pump belt if it is loose. This will hold the camshaft in place while the rocker shafts and arms are removed.

4. Loosen the camshaft cap bolts but do not remove them from the caps. Remove the caps, arms, shafts and bolts all as an assembly.

5. Disassemble the unit keeping all parts in order and repair as required.

6. The installation is the reverse of the removal procedure. Make sure the arrows on the caps are all pointing to the front of the engine. Torque the cap bolts first to 85 inch lbs. (10 Nm), then to 175 inch lbs. (18 Nm) in the following order: No. 3 cap, No. 2 cap, No. 4 cap, Front cap, Rear cap.

3.0L Engine

1. Disconnect the negative battery cable. Remove the air cleaner assembly.

2. Remove the valve cover.

3. Using the auto lash adjuster retainer tools MD998443 or equivalent, install them on the rocker arms to keep the lash adjusters from falling out.

4. On the right side cylinder head, remove the distributor extension.

5. Have a helper hold the rear end of the camshaft down. If the rear of the camshaft cannot be held down, the belt will dislodge and the valve timing will be lost. Loosen the camshaft cap bolts but do not remove them from the caps. Remove the caps, arms, shafts and bolts all as an assembly.

6. Disassemble the unit keeping all parts in order and repair as required.

7. The installation is the reverse of the removal procedure. Apply a drop of sealant to the rear edge of the rear cap. Torque the cap bolts first to 85 inch lbs. (19 Nm), then to 180 inch lbs. (19 Nm) in the following order: No. 3 cap, No. 2 cap, No. 1 cap, No. 4 cap.

3.3L Engine

1. Disconnect the negative battery cable.

2. Remove the upper intake manifold assembly.

3. Remove the valve cover.

4. Remove the rocker shaft retaining bolts and retainers.

5. Remove the rocker shaft and arm assembly. Disassemble and repair as required.

6. The installation is the reverse of the removal procedure. Torque the retaining bolts gradually and evenly to 21 ft. lbs. (28 Nm).

7. Allow 20 minutes tappet bleed down time after rocker shaft installation before starting the engine.

3.9L Engine

1. Disconnect the negative battery cable.

2. Remove the valve cover and gasket.

3. Note the positioning of the oil notch and remove the rocker arms and shaft assembly from the head.

4. Disassemble the unit as required and replace all worn parts.

NOTE: On engines with exhaust valve rotators, the exhaust rocker arm must have relief for clearance.

To install:

5. Make sure all rocker arms with an RH stamped on them are installed to the right of those with an LH. Install the assembly with the notch on the end of the shaft pointing to the engine centerline and to the rear of the right bank or to the front of the left bank. Make sure the longer stamped steel retainers are at the number 2 and 4 positions. Torque the bolts evenly and gradually to 17 ft. lbs. (23 Nm).

Rocker shafts/arms assembly—3.0L engine

Identifying the rocker shafts—3.0L engine

Rocker shaft/arms assembly—3.3L engine

6. Install the valve cover.
7. Connect the negative battery cable and check for leaks.

Intake Manifold

REMOVAL & INSTALLATION

2.6L Engine

1. Disconnect the negative battery cable.
2. Drain the cooling system. Disconnect the hose from the water pump to the intake manifold.
3. Remove the air intake hose along with the top of the air cleaner assembly.
4. Remove the dipstick bracket bolt from the thermostat housing.
5. Remove the carburetor to valve cover bracket. Remove and plug the fuel lines to the carburetor.
6. Disconnect and label the vacuum lines, hoses and wiring connectors from the manifolds and carburetor. Since some of the vacuum lines from the carburetor connect to a solenoid pack on the right side inner fender, unbolt the solenoids from the fender with the vacuum lines attached and fold the assembly over the carburetor.
7. Disconnect all the linkages and the fuel line from the carburetor.
8. Raise the vehicle and support

2 CHRYSLER MID SIZE CARAVAN/VOYAGER/TOWN & COUNTRY • DAKOTA

safely. Disconnect the vacuum hoses from the source below the carburetor and disconnect the air feeder tubes.

9. Remove the manifold nuts and bolts and remove the manifold from the engine.

10. The installation is the reverse of the removal procedure. Torque the in-

take manifold nuts and bolts to 12 ft. lbs. (17 Nm).

3.0L Engine

1. Relieve the fuel system pressure. Disconnect the negative battery cable.
2. Drain the cooling system.

3. Remove the throttle body to air cleaner hose.

4. Remove the throttle body and transaxle kickdown linkage.

5. Remove the AIS motor and TPS wiring connectors from the throttle body.

6. Remove and label the vacuum hose harness from the throttle body.

7. From the air intake plenum, remove the PCV and brake booster hoses and the EGR tube flange.

8. Disconnect and label the charge and temperature sensor wiring at the intake manifold.

9. Remove the vacuum connections from the air intake plenum vacuum connector.

10. Remove the fuel hoses from the fuel rail.

11. Remove the air intake plenum mounting bolts and remove the plenum.

12. Remove the vacuum hoses from the fuel rail and pressure regulator.

13. Disconnect the fuel injector wiring harness from the engine wiring harness.

14. Remove the fuel pressure regulator mounting bolts and remove the regulator from the fuel rail.

15. Remove the fuel rail mounting bolts and remove the fuel rail from the intake manifold.

16. Separate the radiator hose from the thermostat housing and heater hoses from the heater pipe.

17. Remove the intake manifold mounting bolts and remove the manifold from the engine.

18. Clean the gasket mounting surfaces on the engine and intake manifold.

To Install:

19. Using new gaskets, position the intake manifold on the engine and install the mounting nuts and washers.

20. Torque the mounting nuts gradually and evenly, in sequence, to 15 ft. lbs. (20 Nm).

21. Make sure the injector holes are clean. Lubricate the injector O-rings with a drop of clean engine oil and install the injector assembly onto the engine.

22. Install and torque the fuel rail mounting bolts to 10 ft. lbs. (14 Nm).

23. Install the fuel pressure regulator onto the fuel rail.

24. Install the fuel supply and return tube and the vacuum crossover hold-down bolt.

25. Connect the fuel injection wiring harness to the engine wiring harness.

26. Connect the vacuum harness to the fuel pressure regulator and fuel rail assembly.

27. Remove the cover from the lower intake manifold and clean the mating surface.

Intake manifold bolt torque sequence — 3.0L engine

Air intake plenum bolt torque sequence — 3.0L engine

Intake manifold bolt torque sequence — 3.3L engine

28. Place the intake plenum gasket with the beaded sealant side up, on the intake manifold. Install the air intake plenum and torque the mounting bolts gradually and evenly, in sequence, to 10 ft. lbs. (14 Nm).

29. Connect or install all remaining items that were disconnected or removed during the removal procedure.

30. Refill the cooling system. Connect the negative battery cable and check for leaks using the DRB I or II to activate the fuel pump.

3.3L Engine

1. Disconnect the negative battery cable. Relieve the fuel pressure. Drain the cooling system.

2. Remove the air cleaner to throttle body hose assembly.

3. Disconnect the throttle cable and remove the wiring harness from the bracket.

4. Remove AIS motor and TPS wiring connectors from the throttle body.

5. Remove the vacuum hose harness from the throttle body.

6. Remove the PCV and brake booster hoses from the air intake plenum.

7. Disconnect the charge temperature sensor electrical connector. Remove the vacuum harness connectors from the intake plenum.

8. Remove the cylinder head to the intake plenum strut.

9. Disconnect the MAP sensor and oxygen sensor connectors. Remove the engine mounted ground strap.

10. Remove the fuel hoses from the fuel rail and plug them.

11. Remove the DIS coils and the alternator bracket to intake manifold bolt.

12. Remove the upper intake manifold attaching bolts and remove the upper manifold.

13. Remove the vacuum harness connector from the fuel pressure regulator.

14. Remove the fuel tube retainer bracket screw and fuel rail attaching bolts. Spread the retainer bracket to allow for clearance when removing the fuel tube.

15. Remove the fuel rail injector wiring clip from the alternator bracket.

16. Disconnect the cam sensor, coolant temperature sensor and engine temperature sensor.

17. Remove the fuel rail.

18. Remove the upper radiator hose, bypass hose and rear intake manifold hose.

19. Remove the intake manifold bolts and remove the manifold from the engine.

20. Remove the intake manifold seal retaining screws and remove the manifold gasket.

21. Clean out clogged end water passages and fuel runners.

To install:

22. Clean and dry all gasket mating surfaces.

23. Place a drop of silicone sealer onto each of the 4 manifold to cylinder head gasket corners.

CAUTION

The intake manifold gasket is composed of very thin and sharp metal. Handle this gasket with care or damage to the gasket or personal injury could result.

24. Install the intake manifold gasket and torque the end retainers to 10 ft. lbs. (12 Nm).

25. Install the intake manifold and

torque the bolts in sequence to 10 inch lbs. Repeat the sequence increasing the torque to 17 ft. lbs. (23 Nm) and recheck each bolt for 17 ft. lbs. of torque. After the bolts are torqued, inspect the seals to ensure that they have not become dislodged.

26. Lubricate the injector O-rings with clean oil and position the fuel rail in place. Install the rail mounting bolts.

27. Connect the cam sensor, coolant temperature sensor and engine temperature sensor.

28. Install the fuel rail injector wiring clip to the alternator bracket.

29. Install the fuel rail attaching bolts and fuel tube retainer bracket screw.

30. Install the vacuum harness to the pressure regulator.

31. Install the upper intake manifold with a new gasket. Install the bolts only fingertight. Install the alternator bracket to intake manifold bolt and the cylinder head to intake manifold strut and bolts. Torque the intake manifold mounting bolts to 21 ft. lbs. (28 Nm) starting from the middle and working outward. Torque the bracket and strut bolts to 40 ft. lbs. (54 Nm).

32. Install or connect all items that were removed or disconnected from the intake manifold and throttle body.

33. Connect the fuel hoses to the rail. Push the fittings in until they click in place.

34. Install the air cleaner assembly.

35. Connect the negative battery cable and check for leaks using the DRB I or II to activate the fuel pump.

3.9L Engine

1. Relieve the fuel pressure if the vehicle is equipped with fuel injection. Disconnect the negative battery cable from the battery and drain the cooling system.

2. Remove the air pump and bracket. Removal of the bracket will allow for easier installation of the left front corner of the intake manifold.

3. Remove the air cleaner assembly. Unbolt the air conditioning compressor and lay it to the side, if equipped. Remove the distributor cap with all wires attached.

4. Disconnect all wires, hoses, linkages and cables from the carburetor or throttle body. Disconnect the fuel line.

5. Disconnect the ignition coil, coolant temperature sending unit wire and all other connectors along the wiring harness connected to items on the intake manifold.

6. Disconnect the heater hose, upper radiator hose and the lower bypass hose clamp.

7. Remove the valve covers.

8. Unbolt the intake manifold from

Intake manifold bolt torque sequence—3.9L engine

the heads and remove the intake manifold assembly. Disassemble the manifold as required and clean out the exhaust crossover passages.

To install:

9. Clean and dry the intake manifold contact surfaces. Coat the intake manifold side gaskets very lightly with sealer and install the gaskets to the heads. Cutouts at the front of the gaskets differentiate the right and left sides.

10. Apply a thin uniform coat of quick dry cement to the front and rear intake manifold gaskets and mounting surfaces on the block and apply a thin bead of sealer to each of 4 the corners. Install the front and rear gaskets engaging the hole in the block and the tangs from the head gaskets. Apply a second thin bead of sealer above the gaskets in the 4 corners.

11. Carefully lower the intake manifold into position engaging the bypass hose; after it is satisfactorily in place, inspect the gaskets to make sure they have not become dislodged.

12. Install the intake manifold bolts with the aspirator tube, air pump bracket and kickdown linkage bracket in place, if equipped. Torque the bolts in sequence to 25 ft. lbs. (34 Nm). Repeat the sequence retightening the bolts to a final torque of 40 ft. lbs. (54 Nm) and repeat the second step to ensure all bolts are accurately torqued.

13. Clean and dry the valve cover mating surfaces, bolts and bolt holes. Install the valve covers with a new gasket. Torque the screws or nuts to 95 inch lbs. (11 Nm).

14. Connect the heater hose, upper radiator hose and the lower bypass hose clamp.

15. Connect the ignition coil, coolant temperature sending unit wire and all

other connectors that were disconnected along the wiring harness.

16. Install the air conditioning compressor, if equipped. Install the distributor cap and all spark plug wires.

17. Install air pump.

18. Connect all wires, hoses, cables and the fuel line to the carburetor or throttle body. Install the air cleaner assembly.

19. Fill the cooling system.

20. Connect the negative battery cable. Use the DRBII to activate the fuel pump on fuel injected vehicles. Check for leaks.

Exhaust Manifold

REMOVAL & INSTALLATION

2.6L Engine

1. Disconnect the negative battery cable.

2. Remove the air cleaner assembly.

3. Unbolt the power steering pump and position it to the side.

4. Remove the heat cowl from the exhaust manifold.

5. Remove the bolts that attach the exhaust manifold to the after burn chamber below it.

6. Remove manifold mounting nuts and remove the manifold from the engine.

7. The installation is the reverse of the removal procedure. Replace the after burn chamber gasket and exhaust manifold gasket when installing. Torque the manifold mounting nuts to 13 ft. lbs. (18 Nm) starting from the middle and working outward.

3.0L Engine

1. Disconnect the negative battery cable. Raise and safely support the vehicle.

2. Disconnect the exhaust pipe from the rear exhaust manifold, at the articulated joint.

3. Disconnect the EGR tube from the rear manifold and the oxygen sensor wire.

4. Remove the crossover pipe to manifold bolts.

5. Remove the rear manifold to cylinder head nuts and the manifold.

6. Lower the vehicle and remove the heat shield from the manifold.

7. Remove the front manifold to cylinder head nuts and the manifold.

8. Clean the gasket mounting surfaces. Inspect the manifolds for cracks, flatness and/or damage.

9. The installation is the reverse of the removal procedure. When installing, the numbers 1-3-5 on the gaskets are used with the rear cylinders and 2-4-6 are on the gasket for the front cylinders. Torque the manifold to cylinder head nuts to 14 ft. lbs. (19 Nm).

10. Start the engine and check for exhaust leaks.

3.3L Engine

1. Disconnect the negative battery cable.

2. If removing the rear manifold, raise the vehicle and support safely. Disconnect the exhaust pipe at the articulated joint from the rear exhaust manifold.

3. Separate the EGR tube from the rear manifold and disconnect the oxygen sensor wire.

4. Remove the alternator/power steering support strut.

5. Remove the bolts attaching the crossover pipe to the manifold.

6. Remove the bolts attaching the manifold to the head and remove the manifold.

7. If removing the front manifold, remove the heat shield, bolts attaching the crossover pipe to the manifold and the nuts attaching the manifold to the head.

8. Remove the manifold from the engine.

9. The installation is the reverse of the removal procedure. Torque all exhaust manifold attaching bolts to 17 ft. lbs. (23 Nm).

10. Start the engine and check for exhaust leaks.

3.9L Engine

1. Disconnect the negative battery cable. Remove the hot air tube and heat shield, if necessary.

2. Raise the vehicle and support safely. Remove the exhaust pipe from the exhaust manifolds. Lower the vehicle.

3. Take note of all conical washer locations and remove the bolts, nuts and washers attaching the manifold to the head.

Exhaust manifold bolt installation—3.9L engine

4. Remove the manifold.

To install:

5. If either of the end studs came out with the nuts, install a new stud using sealer on the coarse threads.

6. Position the manifold on the end studs. Install conical washers and nuts on the studs.

7. Install the remaining bolts and washers in their proper locations. The inner bolts are not mounted with washers. Working outward from the center, torque the bolts to 20 ft. lbs. (27 Nm) and the nuts to 15 ft. lbs. (20 Nm).

8. Install the exhaust pipe to the manifolds.

9. Connect the negative battery cable and check for exhaust leaks.

Combination Manifold

REMOVAL & INSTALLATION

2.2L and 2.5L Engines

WITHOUT TURBOCHARGER

NOTE: On some vehicles, some of the manifold attaching bolts are not accessible or too heavily sealed from the factory and cannot be removed on the vehicle. Head removal would be necessary in these situations.

1. Disconnect the negative battery cable.

2. Drain the cooling system.

3. Remove the air cleaner and disconnect all vacuum lines, electrical wiring and fuel lines from the carburetor or throttle body.

4. Disconnect the throttle linkage.

5. Loosen the power steering pump and remove the drive belt. On Dakota, remove the power steering and air pump support bracket.

6. Remove the power brake vacuum hose from the intake manifold.

7. On Canadian models, remove the coupling hose from the diverter valve

to the exhaust manifold air injection tube assembly.

8. Remove the water hoses from the water crossover.

9. Raise and safely support the vehicle. Disconnect the exhaust pipe from the exhaust manifold.

10. On Caravan and Voyager, remove the power steering pump and set it aside.

11. Remove the intake manifold support bracket, if equipped.

12. Remove the EGR tube.

13. On Canadian models, remove the air injection tube bolts and the air injection tube assembly.

14. Remove the intake manifold bolts.

15. Lower the vehicle and remove the intake manifold.

16. Remove the exhaust manifold nuts.

17. Remove the exhaust manifold.

To install:

18. Install a new combination manifold gasket.

19. Install the manifold assembly. Install the mounting nuts and torque them to 13 ft. lbs. (18 Nm.) starting from the middle and working outward. Install the heat cowl to the exhaust manifold.

20. Install the intake manifold. Torque the bolts to 17 ft. lbs. (23 Nm.) starting from the middle and working outward.

21. Install the EGR tube.

22. Install the intake support bracket, if equipped.

23. Install the power steering pump, if it was removed.

24. Raise the vehicle and support safely. Install the exhaust pipe to the exhaust manifold.

25. Install the water hoses to the water crossover.

26. Install the power brake vacuum hose to the intake manifold. On Dakota, install the power steering and air pump support bracket.

27. Connect the throttle linkage.

28. Install all vacuum lines, electrical

2 CHRYSLER MID SIZE CARAVAN/VOYAGER/TOWN & COUNTRY • DAKOTA

wiring and fuel lines to the carburetor or throttle body.

29. Install the air cleaner assembly.

30. Refill the cooling system.

31. Connect the negative battery cable and check manifolds for leaks.

WITH TURBOCHARGER

NOTE: On some vehicles, some of the manifold attaching bolts are not accessible or too heavily sealed from the factory and cannot be removed on the vehicle.

Head removal would be necessary in these situations.

1. Disconnect the negative battery cable. Drain the cooling system. Raise and safely support the vehicle.

2. Disconnect the exhaust pipe at the articulated joint. Disconnect the oxygen sensor at the electrical connection.

3. Remove the turbocharger to engine support bracket.

4. Loosen the oil drain back tube

connector hose clamps. Move the tube down on the engine block fitting.

5. Disconnect the turbocharger coolant inlet tube from the engine block and disconnect the tube support bracket.

6. Remove the air cleaner assembly, including the throttle body adaptor, hose and air cleaner box with support bracket.

7. Disconnect the accelerator linkage, throttle body electrical connector and vacuum hoses.

8. Relocate the fuel rail assembly. Remove the bracket to intake manifold screws and the bracket to heat shield clips. Lift and secure the fuel rail (with injectors, wiring harness and fuel lines intact) up and out of the way.

9. Disconnect the turbocharger oil feed line at the oil sending unit Tee fitting.

10. Disconnect the upper radiator hose from the thermostat housing.

11. Remove the cylinder head, manifolds and turbocharger as an assembly.

12. With the assembly on a workbench, loosen the upper turbocharger discharge hose end clamp.

NOTE: Do not disturb the center deswirler retaining clamp.

13. Remove the throttle body to in-

Combination manifold attaching nuts and bolts—2.2L and 2.5L non-turbocharged engine

Manifolds, turbocharger and related parts—2.5L Turbo engine

take manifold screws and throttle body assembly. Disconnect the turbocharger coolant return tube from the water box. Disconnect the retaining bracket on the cylinder head.

14. Remove the heat shield to intake manifold screws and the heat shield.

15. Remove the turbocharger to exhaust manifold nuts and the turbocharger assembly.

16. Remove the intake manifold bolts and the intake manifold.

17. Remove the exhaust manifold nuts and the exhaust manifold.

To install:

18. Place a new 2-sided Grafoil type intake/exhaust manifold gasket; do not use sealant.

19. Position the exhaust manifold on the cylinder head. Apply anti-seize compound to threads, install and torque the retaining nuts, starting at center and progressing outward in both directions, to 17 ft. lbs. (23 Nm). Repeat this procedure until all nuts are at 17 ft. lbs. (23 Nm).

20. Position the intake manifold on the cylinder head. Install and torque the retaining screws, starting at center and progressing outward in both directions, to 19 ft. lbs. (26 Nm). Repeat this procedure until all screws are at 19 ft. lbs. (26 Nm).

21. Connect the turbocharger outlet to the intake manifold inlet tube. Position the turbocharger on the exhaust manifold. Apply anti-seize compound to threads and torque the nuts to 30 ft. lbs. (41 Nm). Torque the connector tube clamps to 30 inch lbs. (41 Nm).

22. Install the tube support bracket to the cylinder head.

23. Install the heat shield on the intake manifold. Torque the screws to 105 inch lbs. (12 Nm).

24. Install the throttle body air horn into the turbocharger inlet tube. Install and torque the throttle body to intake manifold screws to 21 ft. lbs. (28 Nm). Torque the tube clamp to 30 inch lbs.

25. Install the cylinder head/manifolds/turbocharger assembly on the engine.

26. Reconnect the turbocharger oil feed line to the oil sending unit Tee fitting and bearing housing, if disconnected. Torque the tube nuts to 10 ft. lbs. (14 Nm).

27. Install the air cleaner assembly. Connect the vacuum lines and accelerator cables.

28. Reposition the fuel rail. Install and torque the bracket screws to 21 ft. lbs. (28 Nm). Install the air shield to bracket clips.

29. Connect the turbocharger inlet coolant tube to the engine block. Torque the tube nut to 30 ft. lbs. (41 Nm). Install the tube support bracket.

30. Install the turbocharger housing to engine block support bracket and the screws hand tight. Torque the block screw 1st to 40 ft. lbs. (54 Nm). Torque the screw to the turbocharger housing to 20 ft. lbs. (27 Nm).

31. Reposition the drain back hose connector and tighten the hose clamps. Reconnect the exhaust pipe.

32. Connect the upper radiator hose to the thermostat housing.

33. Refill the cooling system.

34. Connect the negative battery cable and check the manifolds for leaks.

Turbocharger

REMOVAL & INSTALLATION

NOTE: On some vehicles, some of the turbocharger to exhaust manifold nuts are not accessible enough to loosen and cannot be removed on the vehicle. Head removal would be necessary in these situations.

1. Disconnect the negative battery cable. Drain the cooling system.

2. Disconnect the EGR valve tube at the EGR valve.

3. Disconnect the turbocharger oil feed at the oil sending unit hex and the coolant tube at the water box. Disconnect the oil/coolant support bracket from the cylinder head.

4. Remove the right intermediate shaft, bearing support bracket and outer driveshaft assemblies.

5. Remove the turbocharger to engine block support bracket.

6. Disconnect the exhaust pipe at the articulated joint. Disconnect the oxygen sensor at the electrical connection.

7. Loosen the oil drain-back tube connector clamps and move the tube hose down on the nipple.

8. Disconnect the coolant tube nut at the block outlet (below steering pump bracket) and tube support bracket.

9. Remove the turbocharger to exhaust manifold nuts. Carefully routing the oil and coolant lines, move the assembly down and out of the vehicle.

To Install:

NOTE: Before installing the turbocharger assembly, be sure it is first charged with oil. Failure to do this may cause damage to the assembly.

10. Position the turbocharger on the exhaust manifold. Apply an anti-seize compound, Loctite® 771-64 or equivalent, to the threads and torque the retaining nuts to 40 ft. lbs. (54 Nm).

11. Connect the coolant tube to engine block fitting. Torque the tube nut to 30 ft. lbs. (41 Nm).

12. Position the oil drain-back hose and torque the clamps to 30 inch lbs.

13. Install and torque the:

Turbocharger to engine support bracket block screw to 40 ft. lbs. (54 Nm).

Turbocharger housing screw to 20 ft. lbs. (27 Nm).

Articulated joint shoulder bolts to 21 ft. lbs. (28 Nm).

14. Install the right driveshaft assembly, the starter and the oil feed line at the sending unit hex. Torque the oil feed tube nut to 10 ft. lbs. (14 Nm) and the EGR tube to EGR valve nut to 60 ft. lbs. (81 Nm).

15. Refill the cooling system. Connect the negative battery cable and check the turbocharger for proper operation.

Timing Chain Case Cover

REMOVAL & INSTALLATION

2.6L Engine

1. Disconnect the negative battery cable.

2. Drain the cooling system.

3. Loosen the power steering pump and air conditioning/alternator belts.

4. Remove the valve cover. Matchmark the distributor to its drive gear and remove the distributor. Remove the alternator.

5. Remove the two small front bolts from the cylinder head; these screw into and seal the top of the timing cover.

6. Support the vehicle safely and raise the vehicle slightly. Support the oil pan with a floor jack and remove the right side motor mount by removing the 2 bolts on either side of the mount, the through bolt and the 21mm nut from the underside of the mount. Remove all of the upper cover bolts that are accessible. Attach a suitable engine support device to the engine. Lower the engine slowly until its weight is supported by the engine support device.

7. Raise the vehicle and support safely. Remove the right wheel and tire assembly and the splash shield. Remove the crankshaft bolt and pull off the crankshaft pulley with the belts.

8. Unbolt the air conditioning compressor bracket from the cover and position it, with the compressor still bolted to it, to the side.

9. Drain the engine oil and remove the oil pan.

Right side motor mount—Caravan and Voyager with 2.6L engine

CAUTION

As soon as the timing cover gasket seal is broken, antifreeze will start pouring out from the water jacket extension in the cover. Stand back when breaking the cover seal, or personal injury may result, especially if the engine is hot.

10. Remove the remaining timing cover retaining bolts and the timing indicator. Remove the motor mount adaptor. Position a drainpan under the timing cover, stand back and separate the cover from the block. When the antifreeze has stopped draining, remove the chain cover.

To install:

11. Thoroughly clean and dry all gasket surfaces. Clean or sand the timing indicator and paint a white mark where the 7 is located to aid in setting the timing.

12. Replace the adjuster window gasket and crankshaft seal. Carefully pry the oil seal out of the cover without scratching the seal bore. Install a new seal with a seal driver or installer such as MD998376-01 and MB990938-01, or their equivalents.

13. Apply a thin coat of silicone sealer to the top of the timing chain cover to seal the head gasket extension. Install the cover to the block using new gaskets.

14. Install the bolts with the timing indicator, compressor bracket and motor mount adaptor in place. Torque the bolts to 13 ft. lbs. (18 Nm).

15. Install the crankshaft pulley with the belts. Thoroughly clean and dry the crankshaft pulley bolt and apply a very thin bead of Loctite® to the

threads. Torque the bolt to 87 ft. lbs. (118 Nm).

16. Install the oil pan with a new gasket. Lower the vehicle.

17. Jack the engine up into position and install the motor mount. Torque the upper bolts to 21 ft. lbs. (29 Nm), the nut underneath to 75 ft. lbs. (102 Nm) and the through bolt and nut to 75 ft. lbs. (102 Nm). Remove the engine support device.

18. Thoroughly clean and dry the 2 end bolts that attach the chain cover to the head. Install them and torque to 13 ft. lbs. (18 Nm).

19. Install the alternator.

20. Install the distributor aligning the matchmarks.

21. Install the valve cover with a new gasket.

22. Adjust all belt tensions.

23. Refill the cooling system and fill the engine with oil.

24. Connect the negative battery cable, road test the vehicle and check for leaks.

3.3L Engine

1. Disconnect the negative battery cable. Drain the cooling system.

2. Support the engine with a suitable engine support device and remove the right side motor mount.

3. Raise the vehicle and support safely. Drain the engine oil and remove the oil pan.

4. Remove the right wheel and tire assembly and the splash shield.

5. Remove the drive belt.

6. Unbolt the air conditioning compressor and position it to the side. Re-

move the compressor mounting bracket.

7. Remove the crankshaft pulley bolt and remove the pulley using a suitable puller.

8. Remove the idler pulley from the engine bracket and remove the bracket.

9. Remove the cam sensor from the timing chain cover.

10. Unbolt and remove the cover from the engine. Make sure the oil pump inner rotor does not fall out. Remove the three O-rings from the coolant passages and the oil pump outlet.

To install:

11. Thoroughly clean and dry the gasket mating surfaces. Install new O-rings to the block.

12. Remove the crankshaft oil seal from the cover. The seal must be removed from the cover when installing to ensure proper oil pump engagement.

13. Using a new gasket, install the chain case cover to the engine.

14. Make certain that the oil pump is engaged onto the crankshaft before proceeding, or severe engine damage will result. Install the attaching bolts and torque to 20 ft. lbs. (27 Nm).

15. Use tool C-4992 to install the crankshaft oil seal. Install the crankshaft pulley using a 5.9 in. suitable bolt and thrust bearing and washer plate L-4524. Make sure the pulley bottoms out on the crankshaft seal diameter. Install the bolt and torque to 40 ft. lbs. (54 Nm).

16. Install the engine bracket and torque the bolts to 40 ft. lbs. (54 Nm). Install the idler pulley to the engine bracket.

17. To install the cam sensor, first clean off the old spacer from the sensor face completely. Inspect the O-ring for damage and replace if necessary. A new spacer must be attached to the cam sensor prior to installation; if a new spacer is not used, engine performance will be adversely affected. Oil the O-ring lightly and push the sensor into its bore in the chain case cover until contact is made with the cam timing gear. Hold in this position and tighten the bolt to 9 ft. lbs. (12 Nm).

18. Install the air conditioning compressor and bracket.

19. Install the drive belt.

20. Install the inner splash shield and the wheel and tire assembly.

21. Install the oil pan with a new gasket.

22. Install the motor mount.

23. Remove the engine temperature sensor and fill the cooling system until the level reaches the vacant sensor hole. Install the sensor and continue to fill the radiator. Fill the engine with the proper amount of oil.

Timing chain cover — 3.3L engine

Timing chain cover removed — 3.3L engine

24. Connect the negative battery cable and check for leaks.

3.9L Engine

1. Disconnect the negative battery cable.
2. Drain the cooling system.
3. Remove the radiator, fan and all related parts. Remove the water pump.
4. Remove the crankshaft pulley.
5. Remove the vibration damper using the proper puller.
6. Disconnect the fuel lines from the fuel pump, if equipped.
7. Remove the 2 front bolts from the oil pan.

8. Unbolt the chain cover from the block and remove, using caution to avoid damaging the oil pan gasket. Remove the fuel pump from the cover, if equipped.

To install:

9. Clean and dry the mating surfaces of the cover and block. Apply a thin bead of sealer to the oil pan gasket.
10. Install a new cover gasket and install the cover. Torque the bolts to 30 ft. lbs. (41 Nm).
11. Install the water pump with a new gasket.
12. Install the vibration damper with tool C-3638, install the bolt and washer and torque to specification. Apply a

small amount of sealer to the bolts and install the crankshaft pulley.

13. Install the fuel pump using a new gasket, if equipped and connect the fuel lines. Install the 2 oil pan bolts.

14. Install the radiator, fan and all related parts.

15. Fill the cooling system.

16. Connect the negative battery cable and check for leaks.

Front Cover Oil Seal

REMOVAL & INSTALLATION

2.6L Engine

1. Disconnect the negative battery cable.
2. Loosen the power steering pump and air conditioning compressor.
3. Raise the vehicle and support safely. Remove the right front tire and wheel assembly and the inner splash shield.
4. Remove the crankshaft pulley with the belts.
5. Pry the seal from its bore using a suitable prying tool.

To install:

6. Install a new seal with a seal driver or installer such as MD998376-01 and MB990938-01, or their equivalents.
7. Install the crankshaft pulley with the belts. Thoroughly clean and dry the crankshaft pulley bolt and apply a very thin bead of Loctite® to the threads. Torque the bolt to 87 ft. lbs. (118 Nm).
8. Adjust the belt tensions.
9. Install the splash shield and the tire and wheel assembly.
10. Connect the negative battery cable and check for leaks.

3.3L Engine

1. Disconnect the negative battery cable.
2. Raise the vehicle and support safely. Remove the right front tire and wheel assembly and the inner splash shield.
3. Remove the drive belt.
4. Remove the crankshaft bolt. Using a suitable puller, remove the crankshaft pulley.
5. Use tool C-4991 to remove the seal.

To install:

6. Clean out the bore. Place the seal with the spring toward the engine. Install the new seal using tool C-4992 until it is flush with the cover.
7. Install the crankshaft pulley using a 5.9 in. suitable bolt and thrust bearing and washer plate L-4524. Make sure the pulley bottoms out on the crankshaft seal diameter. Install the bolt and torque to 40 ft. lbs. (54 Nm).

8. Install the drive belt.
9. Install the splash shield and the tire and wheel assembly.
10. Connect the negative battery cable and check for leaks.

3.9L Engine

1. Disconnect the negative battery cable.
2. Remove the belts from the crankshaft pulley.
3. Remove the fan and shroud from the vehicle.
4. Remove the crankshaft pulley.
5. Remove the vibration damper using the proper puller.
6. Using a suitable tool behind the lips of the oil seal, pry outward. Take care not to damage the crankshaft seal surface of the cover.

To install:

7. Install the new seal by installing the threaded shaft part of the special tool C-4251 into the threads of the crankshaft.
8. Place the seal into the opening with the spring toward the engine. Place the installing adapter C-4251-3 with the thrust bearing and nut on the shaft. Tighten the nut until the tool is flush with the timing chain cover. Remove the tool.
9. Install the damper with tool C-3638, install the bolt and washer and torque to specification.
10. Apply a small amount of sealer to the bolts and install the crankshaft pulley.
11. Install the fan and shroud.
12. Connect the negative battery cable and check for leaks.

Timing Chain and Gears

REMOVAL & INSTALLATION

2.6L Engine

1. If possible, position the engine so that the No. 1 piston is at TDC on the compression stroke. Disconnect the negative battery cable. Drain the coolant.
2. Remove the timing chain case cover.
3. Remove the 3 silent shaft chain guides. Label each bolt as it is removed. The bolts are of different lengths and styles and must be replaced in the correct locations.
4. Remove the flange bolts from the chain from the right silent shaft and oil pump gears and carefully remove the chain with all 3 gears. Watch for the aligning keys on the oil pump shaft and right silent shaft. If the chain is removed individually, remove the gears afterward.

NOTE: The 2 gears are identical, but the oil pump drive sprocket is installed with the concave side toward the engine while the right silent shaft sprocket has the concave side out.

5. The timing chain tensioner maintains constant spring pressure on the chain. To prevent it from popping out of the oil pump it must be fastened in place. Run a piece of wire around the plunger and the left side of the oil pump. Remove the remaining chain guides.
 6. Remove the camshaft gear bolt and pry the distributor drive gear from the cam gear. Remove the gear from the camshaft and allow it to sit on the gear holder below it. Rotate the camshaft so the spring pin is at the 12 o'clock position.
 7. Unbolt the holder and remove the chain with both gears. Remove the tensioner and spring from the oil pump.
 8. Inspect all gears for wear and replace as required.
- To install:**
9. Assemble the new timing chain with the gears. Both the crankshaft sprocket and the camshaft sprocket have a small dot on their faces. Assemble the chain and sprockets so that each dot aligns with the plated links on the chain. Both sets of marks and links must align.
 10. Turn the crankshaft as required so that the installed positions of the respective gears are correct.
 11. Install the new tensioner and spring in the bore of the oil pump and hold it down with a piece of wire.
 12. Install the crankshaft gear to the crankshaft and install the cam gear holder while holding the gear up in place. Allow the cam gear to rest on the holder.
 13. Lift the cam gear into place against the camshaft, install the distributor drive gear and install the bolt.

Make certain the sprocket engages the guide pin correctly. Tighten the bolt to 40 ft. lbs.

14. Remove the wire holding the tensioner plunger and allow it to tension the chain. Install the left side guide.
15. Assemble the silent shaft gear, the oil pump gear and the silent shaft chain. Again, each sprocket is marked with a dot which must be aligned with the plated links on the chain. The sprocket for the silent shaft mounts with the concave side facing out (away from the engine block) and the sprocket for the oil pump mounts with the concave side facing the engine block.
16. Install the silent chain with gears onto the shafts. Turn the oil pump shaft and right silent shaft as required to keep the marks aligned.
17. Install the chain guides. Make sure the lock washer is installed between the tensioner guide pivot bolt and the timing chain guide under it. Torque all 10mm flanged bolts to 13 ft. lbs. (18 Nm). Adjust the upper guide so that when the chain is pulled downward at the center, the clearance between the chain and the guide is 0.008-0.031 in. (0.20-0.80mm). Torque the tensioner guide locking bolt to 14 ft. lbs.
18. Install the gear retaining bolts to the oil pump and right silent shaft. Torque the bolts to 25 ft. lbs. (34 Nm).
19. Install the timing chain case cover and all related parts.
20. Refill the cooling system and fill the engine with oil.
21. Connect the negative battery cable, road test the vehicle and check for leaks.

3.3L Engine

1. If possible, position the engine so that the No. 1 piston is at TDC on the compression stroke. Disconnect the negative battery cable. Drain the coolant.

Camshaft position for chain installation—2.6L engine

Timing chain, silent shaft chain and related parts—2.6L engine

Timing chain installation—2.6L engine

2. Remove the timing chain case cover.

3. Remove the camshaft gear attaching cup washer and remove the timing chain with both gears attached. Remove the timing chain snubber.

To install:

4. Assemble the timing chain and gears.

5. Turn the crankshaft and camshaft to line up with the keyway locations of the gears.

6. Slide both gears over their respective shafts and use a straightedge to confirm alignment.

7. Install the cup washer and camshaft bolt. Torque the bolt to 35 ft. lbs. (47 Nm).

8. Check camshaft endplay. The specification with a new plate is 0.002–0.006 in. (0.051–0.052mm) and 0.002–0.010 in. (0.51–0.254mm) with a used plate. Replace the thrust plate if not within specifications.

9. Install the timing chain snubber.

10. Thoroughly clean and dry the gasket mating surfaces.

11. Install new O-rings to the block.

12. Remove the crankshaft oil seal from the cover. The seal must be removed from the cover when installing to ensure proper oil pump engagement.

13. Using a new gasket, install the chain case cover to the engine.

14. Make certain that the oil pump is engaged onto the crankshaft before proceeding, or severe engine damage will result. Install the attaching bolts and torque to 20 ft. lbs. (27 Nm).

15. Use tool C-4992 to install the crankshaft oil seal. Install the crankshaft pulley using a 5.9 in. suitable bolt and thrust bearing and washer plate L-4524. Make sure the pulley bottoms out on the crankshaft seal diameter. Install the bolt and torque to 40 ft. lbs. (54 Nm).

16. Install all other parts removed during the chain case cover removal procedure.

17. To install the cam sensor, first

Silent shaft chain installation—2.6L engine

Timing mark alignment—3.3L engine

clean off the old spacer from the sensor face completely. Inspect the O-ring for damage and replace if necessary. A new spacer must be attached to the cam sensor prior to installation; if a new spacer is not used, engine performance will be adversely affected. Oil the O-ring lightly and push the sensor into its bore in the chain case cover until contact is made with the cam timing gear. Hold in this position and tighten the bolt to 10 ft. lbs. (12 Nm).

18. Refill the cooling system and fill the engine with oil.

19. Connect the negative battery cable, road test the vehicle and check for leaks.

3.9L Engine

1. If possible, crank the engine around so that the No. 1 cylinder is at TDC on the compression stroke. Remove the distributor cap to confirm

and line the timing mark on the damper pulley with 0 on the timing scale. This will aid in aligning timing marks when installing the timing gears. Disconnect the negative battery cable.

2. Drain the cooling system.
3. Remove the radiator, fan and all related parts. Remove the water pump.
4. Remove the crankshaft pulley.
5. Remove the vibration damper using the proper puller.
6. Disconnect the fuel lines from the fuel pump, if equipped.
7. Remove the 2 front bolts from the oil pan.
8. Unbolt the chain cover from the block and remove, using caution to avoid damaging the oil pan gasket. Remove the fuel pump from the cover, if equipped.
9. Remove the camshaft gear retaining bolt, cup washer and fuel pump eccentric, if equipped. Remove the timing chain and gears.

To install:

10. Place both camshaft and crankshaft gears on the bench with the timing marks on the exact imaginary center line through both gear bores as they are installed on the engine. Place the timing chain around both sprockets.

11. Turn the crankshaft and camshaft so the keys line up with the keyways in the gears when the timing marks are in proper position.

12. Slide both gears over their re-

Timing mark alignment—3.9L engine

spective shafts and use a straightedge to check timing mark alignment.

13. Install the fuel pump eccentric and cup washer, if equipped. Torque the camshaft gear retaining bolt to 35 ft. lbs. (47 Nm).

14. Clean and dry the mating surfaces of the timing chain cover and block. Apply a thin bead of sealer to the oil pan gasket.

15. Install a new cover gasket and install the cover. Torque the bolts to 30 ft. lbs.

16. Install the water pump with a new gasket, if it was removed.

17. Install the damper with tool C-3638, install the bolt and washer and torque to specification. Apply a small amount of sealer to the bolts and install the crankshaft pulley.

18. Install the fuel pump using a new gasket, if equipped and connect the fuel lines. Install the 2 oil pan bolts, if they were removed.

19. Install the radiator, fan and all related parts.

20. Fill the cooling system.

21. Connect the negative battery cable, set all adjustments to specifications and check for leaks.

Timing Belt Cover

REMOVAL & INSTALLATION

2.2L and 2.5L Engines

1. Disconnect the negative battery cable.
2. Remove the nuts that attach the upper cover to the valve cover.
3. Remove the bolt that attaches the upper cover to the lower cover.
4. Remove the upper cover.
5. Raise the vehicle and support safely. Remove the right side splash shield.
6. Remove the crankshaft pulley, water pump pulley and the belts.
7. Remove the lower cover attaching bolts.
8. Remove the lower cover.
9. The installation is the reverse of the removal procedure.

3.0L Engine

1. Disconnect the negative battery cable.

2. If equipped with air conditioning, loosen the adjustment pulley locknut, turn the screw counterclockwise to reduce the drive belt tension and remove the belt.

3. To remove the serpentine drive belt, insert a ½ in. breaker bar in to the square hole of the tensioner pulley, rotate it counterclockwise to reduce the drive belt tension and remove the belt.

4. Remove the air conditioning compressor and the air compressor bracket if equipped, power steering pump and alternator from the mounts; support them aside. Remove power steering pump/alternator automatic belt tensioner bolt and the tensioner.

5. Raise and safely support the vehicle. Remove the right inner fender splash shield.

6. Remove the crankshaft pulley bolt and the pulley/damper assembly from the crankshaft.

7. Lower the vehicle and place a floor jack under the engine to support it.

8. Separate the front engine mount insulator from the bracket. Raise the engine slightly and remove the mount bracket.

9. Remove the timing belt cover bolts and the upper and lower covers from the engine.

10. The installation is the reverse of the removal procedure. The engine mount through bolt must be torqued to 75 ft. lbs. (102 Nm) on 1987-88 vehicles or 100 ft. lbs. (136 Nm) on 1989-90 vehicles with the engine support removed and the engine's weight on the mount.

Timing Belt and Tensioner

ADJUSTMENT

2.2L and 2.5L Engines

1. Disconnect the negative battery cable.

2. Raise the vehicle and support safely. Remove the right front inner splash shield.

3. Remove the tensioner cover.

4. Place the special tensioning tool C-4703 on the hex of the tensioner so the weight is at about the 10 o'clock position and loosen the bolt.

5. The tensioner should drop down to the 9 o'clock position. Reposition the tool as required in order to have it end up at the 9 o'clock position (parallel to the ground, hanging to the left) plus or minus 15 degrees.

6. Hold the tool in position and tighten the bolt. Do not pull the tool past the 9 o'clock position; this will

SPECIAL TOOL

HORIZONTAL (WITHIN 15°)

Adjusting the timing belt—2.2L and 2.5L engines

make the belt too tight and will cause it to howl or possibly break.

7. Install the cover and the splash shield.

3.0L Engine

1. Loosen the bolt that holds the timing belt tensioner in place. The bolt is located to the left of the accessory belt tensioner mounting.

2. Allow the spring to pull the tensioner in automatically.

3. Tighten the tensioner locking bolt.

REMOVAL & INSTALLATION

2.2L and 2.5L Engines

1. If possible, position the engine so that the No. 1 piston is at TDC. Disconnect the negative battery cable.

2. Remove the timing belt covers. Remove the timing belt tensioner and allow the belt to hang free.

3. On Caravan and Voyager, place a floor jack under the engine and separate the right motor mount.

4. Remove the air conditioning compressor belt idler pulley, if equipped and remove the mounting stud. Unbolt the compressor/alternator bracket and position it to the side.

5. Remove the timing belt from the vehicle.

To install:

6. Turn the crankshaft sprocket and intermediate shaft sprocket until the marks are in line. Use a straight-edge from bolt to bolt to confirm alignment.

7. Turn the camshaft until the small hole in the sprocket is at the top and rows on the hub are in line with the camshaft cap to cylinder head mounting lines. Use a mirror to see the alignment so it is viewed straight on and not at an angle from above. Install the belt, but let it hang free at this point.

COVER (REFERENCE)

COVER TIMING HOLE PLUG

Alignment of the arrows on the camshaft sprocket with the camshaft cap to cylinder head mounting line

Alignment of the crankshaft sprocket and intermediate shaft sprocket—2.2L and 2.5L engines

Timing belt Installation—2.2L and 2.5L engines

8. Install the air conditioning compressor/alternator bracket, idler pulley and motor mount. Remove the floor jack. Raise the vehicle and support safely. Have the tensioner at an arm's reach because the timing belt will have to be held in position with one hand.

9. To properly install the timing

belt, reach up and engage it with the camshaft sprocket. Turn the intermediate shaft counterclockwise slightly, then engage the belt with the intermediate shaft sprocket. Hold the belt against the intermediate shaft sprocket and turn clockwise to take up all tension; if the timing marks are out of alignment, repeat until alignment is correct.

10. Using a 13mm wrench, turn the crankshaft sprocket counterclockwise slightly and wrap the belt around it. Turn the sprocket clockwise so there is no slack in the belt between sprockets; if the timing marks are out of alignment, repeat until alignment is correct.

NOTE: If the timing marks are in line but slack exists in the belt between either the camshaft and intermediate shaft sprockets or the intermediate and crankshaft sprockets, the timing will be incorrect when the belt is tensioned. All slack must be only between the crankshaft and camshaft sprockets.

11. Install the tensioner and install the mounting bolt loosely. Place the special tensioning tool C-4703 on the hex of the tensioner so the weight is at about the 9 o'clock position (parallel to the ground, hanging to the left) plus or minus 15 degrees.

12. Hold the tool in position and tighten the bolt to 45 ft. lbs. (61 Nm). Do not pull the tool past the 9 o'clock position; this will make the belt too tight and will cause it to howl or possibly break.

13. Lower the vehicle and recheck the camshaft sprocket positioning. If it is correct install the timing belt covers and all related parts.

14. Connect the negative battery cable and road test the vehicle.

3.0L Engine

1. If possible, position the engine so that the No. 1 cylinder is at TDC. Disconnect the negative battery cable. Remove the timing covers from the engine.

2. If the same timing belt will be reused, mark the direction of the timing belt's rotation, for installation in the same direction. Make sure the engine is positioned so the No. 1 cylinder is at the TDC of it's compression stroke and the sprockets timing marks are aligned with the engine's timing mark indicators.

3. Loosen the timing belt tensioner bolt and remove the belt. If not removing the tensioner, position it as far away from the center of the engine as possible and tighten the bolt.

Timing belt Installation—3.0L engine

4. If the tensioner is being removed, paint the outside of the spring to ensure that it is not installed backwards. Unbolt the tensioner and remove it along with the spring.

To install:

5. Install the tensioner, if removed and hook the upper end of the spring to the water pump pin and the lower end to the tensioner in exactly the same position as originally installed. If not already done, position both camshafts so the marks line up with those on the alternator bracket (rear bank) and inner timing cover (front bank). Rotate the crankshaft so the timing mark aligns with the mark on the oil pump.

6. Install the timing belt on the crankshaft sprocket and while keeping the belt tight on the tension side (right side), install the belt on the front camshaft sprocket.

7. Install the belt on the water pump pulley, then the rear camshaft sprocket and the tensioner.

8. Rotate the front camshaft counterclockwise to tension the belt between the front camshaft and the crankshaft. If the timing marks came out of line, repeat the procedure.

9. Install the crankshaft sprocket flange.

10. Loosen the tensioner bolt and allow the spring to tension the belt.

11. Turn the crankshaft 2 full turns in the clockwise direction only until the timing marks align again. Now that the belt is properly tensioned, torque the tensioner lock bolt to 21 ft. lbs. (29 Nm).

12. Install the timing belt covers and all related parts.

13. Connect the negative battery cable and road test the vehicle.

Timing Sprockets

REMOVAL & INSTALLATION

2.2L and 2.5L Engines

1. Disconnect the negative battery cable. Remove the timing belt.

2. Remove the crankshaft sprocket bolt. Using the puller tool C-4685 or equivalent and the button from tool L-4524 or equivalent, remove the crankshaft sprocket.

3. Using the tool C-4687 or equivalent, hold the camshaft and/or intermediate sprocket, remove the center bolt and the sprocket(s).

4. The installation is the reverse of the removal procedure. Torque the camshaft and intermediate sprocket bolts to 65 ft. lbs. (88 Nm) and the crankshaft sprocket bolt to 50 ft. lbs. (68 Nm).

3.0L Engine

1. Disconnect the negative battery cable.

2. Remove the timing belt.

3. To remove the camshaft sprocket, hold the sprocket with tool MB990775, or equivalent and remove the retaining bolt and washer.

4. To remove the crankshaft sprocket, remove the bolt and remove the sprocket from the crankshaft.

5. The installation is the reverse of the removal procedure. Torque the camshaft sprocket bolt to 70 ft. lbs. (95 Nm) while holding the sprocket with the holding tool. Torque the crankshaft sprocket bolt to 110 ft. lbs. (150 Nm).

Camshaft

REMOVAL & INSTALLATION

2.2L and 2.5L Engines

1. Disconnect the negative battery cable. Relieve the fuel pressure, if equipped with fuel injection.

2. Turn the crankshaft so the No. 1 piston is at the TDC of the compression stroke. Remove the upper timing belt cover. Remove the air pump pulley, if equipped.

3. Remove the camshaft sprocket bolt and the sprocket and suspend tightly so the belt does not lose tension. If it does, the belt timing will have to be reset.

4. Remove the valve cover.

5. If the rocker arms are being reused, mark them for installation identification and loosen the camshaft bearing bolts, evenly and gradually.

6. Using a soft mallet, rap the rear of the camshaft a few times to break the bearing caps loose.

7. Remove the bolts, bearing caps and the camshaft with seals.

NOTE: Before replacing the camshaft, identify factory installed oversized components. To do so, look for the tops of the bearing caps painted green and O/SJ stamped rearward of the oil gallery plug on the rear of the head. In addition, the barrel of the camshaft is painted green and O/SJ is stamped onto the rear end of the camshaft. Installing standard sized parts in an head equipped with oversized parts—or visa versa—will cause severe engine damage.

Also, take note of the color of the paint stripe on the rear camshaft seal. These stripes differentiate seal sizes. If a seal with a different color stripe is installed, a severe leak will develop if the seal is too small, or the cap will not be able to be fully installed if the seal is too big.

8. Check the oil passages for blockages and the parts for wear and damage and replace parts, as required. Clean the gasket mounting surfaces.

To Install:

9. Transfer the sprocket key to the new camshaft. New rocker arms and a new camshaft sprocket bolt are normally included with the camshaft package. Install the rocker arms, lubricate the camshaft and install with end seals installed.

10. Place the bearing caps with No. 1 at the timing belt end and No. 5 at the transaxle end. The camshaft bearing caps are numbered and have arrows

facing forward. Torque the camshaft bearing bolts evenly and gradually to 18 ft. lbs. (24 Nm).

NOTE: Apply RTV silicone gasket material to the No. 1 and 5 bearing caps. Install the bearing caps before the seals are installed.

11. Mount a dial indicator to the front of the engine and check the camshaft endplay. Play should not exceed 0.006 in.

12. Install the camshaft sprocket and the new bolt. Install the air pump pulley, if equipped.

13. Install the valve cover with a new gasket.

14. Connect the negative battery cable and check for leaks.

2.6L Engine

1. Disconnect the negative battery cable.

2. Remove the valve cover.

3. Remove the camshaft gear retaining bolt and matchmark the distributor gear to its drive gear. Remove the distributor. Pry the distributor drive gear off of the cam gear.

4. Remove the cam gear from the camshaft and allow it to rest on the holder below it.

5. Remove the water pump pulley.

6. Remove the camshaft cap bolts evenly and gradually.

7. Remove the caps, shafts, rocker arms and bolts together as an assembly.

8. Remove the camshaft with the rear seal from the engine.

To install:

9. Install a new roll pin to the camshaft. Lubricate the camshaft and install with the rear seal in place. Install the camshaft in position so the hole in the gear will line up with the roll pin.

10. Install the rocker caps, shafts and arms assembly. Tighten the camshaft bearing cap bolts in the following order to 85 inch lbs. (10 Nm): No. 3, No. 2, No. 4, front cap, rear cap. Repeat the sequence increasing the torque to 175 inch lbs. (19 Nm).

11. Install the gear to the camshaft engaging the roll pin. Install the distributor drive gear and install the bolt and washer. Torque the bolt to 40 ft. lbs. (54 Nm). Install the distributor.

12. Install the valve cover and all related parts.

3.0L Engine

1. Disconnect the negative battery cable. Remove the air cleaner assembly and valve covers.

2. Install auto lash adjuster retainers MD998443 or equivalent on the rocker arms.

3. If removing the right side (front)

camshaft, remove the distributor extension.

4. Remove the camshaft bearing caps but do not remove the bolts from the caps.

5. Remove the rocker arms, rocker shafts and bearing caps, as an assembly.

6. Remove the camshaft from the cylinder head.

7. Inspect the bearing journals on the camshaft, cylinder head and bearing caps.

To Install:

8. Lubricate the camshaft journals and camshaft with clean engine oil and install the camshaft in the cylinder head.

9. Align the camshaft bearing caps with the arrow mark (depending on cylinder numbers) and in numerical order.

10. Apply sealer at the ends of the bearing caps and install the assembly.

11. Torque the bearing cap bolts, in the following sequence: No. 3, No. 2, No. 1 and No. 4 to 85 inch lbs. (10 Nm).

12. Repeat the sequence increasing the torque to 175 inch lbs. (18 Nm).

13. Install the distributor extension, if it was removed.

14. Install the valve cover and all related parts.

3.3L Engine

1. Relieve the fuel pressure. Disconnect the negative battery cable.

2. Remove the engine from the vehicle. Remove the intake manifold, cylinder heads, timing chain cover and timing chain from the engine.

3. Remove the rocker arm and shaft assemblies.

4. Label and remove the pushrods and lifters.

5. Remove the camshaft thrust plate.

6. Install a long bolt into the front of the camshaft to facilitate its removal. Remove the camshaft being careful not to damage the cam bearings with the cam lobes.

To install:

7. Install the camshaft to within 2 in. of its final installation position.

8. Install the camshaft thrust plate and 2 bolts and torque to 10 ft. lbs. (12 Nm).

9. Place both camshaft and crankshaft gears on the bench with the timing marks on the exact imaginary center line through both gear bores as they are installed on the engine. Place the timing chain around both sprockets.

10. Turn the crankshaft and camshaft so the keys line up with the keyways in the gears when the timing marks are in proper position.

11. Slide both gears over their respective shafts and use a straightedge to check timing mark alignment.

12. Measure camshaft endplay. If not within specifications, replace the thrust plate.

13. If the camshaft was not replaced, lubricate and install the lifters in their original locations. If the camshaft was replaced, new lifters must be used.

14. Install the pushrods and rocker shaft assemblies.

15. Install the timing chain cover, cylinder heads and intake manifold.

16. Install the engine in the vehicle.

17. When everything is bolted in place, change the engine oil and replace the oil filter.

NOTE: If the camshaft or lifters have been replaced, add 1 pint of Mopar crankcase conditioner, or equivalent when replenishing the oil to aid in break in. This mixture should be left in the engine for a minimum of 500 miles and drained at the next normal oil change.

18. Fill the radiator with coolant.

19. Connect the negative battery cable, set all adjustments to specifications and check for leaks.

3.9L Engine

1. If possible, crank the engine around so that the No. 1 cylinder is at TDC on the compression stroke. Remove the distributor cap to confirm and line the timing mark on the damper pulley with 0 on the timing scale. This will aid in aligning timing marks when installing the timing gears.

2. If the vehicle is equipped with fuel injection, relieve the fuel pressure. Disconnect the negative battery cable. Drain the cooling system.

3. Remove the valve cover(s).

4. Remove the rocker shaft assemblies. Identify and remove the pushrods.

5. Remove the intake manifold. Identify and remove all lifters.

6. Remove the distributor.

7. Lift out the oil pump and distributor driveshaft.

8. Remove the radiator, fan and all related parts.

9. Remove the fuel pump, if equipped. Remove the timing chain cover, timing chain and gears.

10. Note the location of the oil tab and remove the camshaft thrust plate.

11. Install suitable long bolt into the front of the camshaft to facilitate removal. Remove the camshaft, being careful not to damage any of the cam bearings with the cam lobes.

To install:

12. Install the camshaft to within 2 in. of its final installation position.

Installing the camshaft blocking tool – 3.9L engine

13. Install the camshaft blocking tool C-3509 and bolt it in place with the distributor hold-down bolt. This will prevent the camshaft from being pushed in too far and knocking out the welch plug at the rear of the block. This tool should remain in place until the timing chain installation has been completed.

14. Install the camshaft thrust plate and chain oil tab. Make sure the tang of the oil tab enters the hole in the thrust plate at the lower right. Torque the bolts to 18 ft. lbs. (24 Nm). Make sure the top edge of the oil tab is flat against the thrust plate or it will not feed oil to the chain.

15. Place both camshaft and crankshaft gears on the bench with the timing marks on the exact imaginary center line through both gear bores as they are installed on the engine. Place the timing chain around both sprockets.

16. Turn the crankshaft and camshaft so the keys line up with the keyways in the gears when the timing marks are in proper position.

17. Slide both gears over their respective shafts and use a straightedge to check timing mark alignment.

18. Install the fuel pump eccentric and cup washer, if equipped. Torque the camshaft gear retaining bolt to 35 ft. lbs. (47 Nm). Remove the camshaft blocking tool, if it was installed.

19. Measure camshaft endplay, if applicable. Replace the thrust plate if not within specifications.

20. Coat the oil pump and distributor driveshaft with oil. Install the shaft so that when the gear spirals into place and drops into the oil pump, the slot in the top of the gear is pointing directly to the left front intake manifold bolt hole.

21. If the camshaft was not replaced, lubricate and install the lifters in their original locations. If the camshaft was replaced, new lifters must be used.

22. Install the pushrods and rocker shaft assemblies.

23. Install the intake manifold, if it was removed. Install the valve covers.

24. Install the distributor so the ro-

Installed distributor drive gear position – 3.9L engine

tor points to the No. 1 spark plug wire position on the cap.

25. Install the timing chain cover and all related parts.

26. Install the fuel pump if equipped and radiator.

27. When everything is bolted in place, change the engine oil and replace the oil filter.

NOTE: If the camshaft or lifters have been replaced, add 1 pint of Mopar crankcase conditioner, or equivalent when replenishing the oil to aid in break in. This mixture should be left in the engine for a minimum of 500 miles and drained at the next normal oil change.

28. Fill the radiator with coolant.

29. Connect the negative battery cable, set all adjustments to specifications and check for leaks.

Intermediate Shaft

REMOVAL & INSTALLATION

2.2L and 2.5L Engines

1. Disconnect the negative battery cable.

2. Crank the engine around until the No. 1 piston is at TDC. Remove the timing belt covers to confirm that all timing marks are lined up.

3. Remove the fuel pump, if equipped. Remove the distributor. Looking down at the oil pump, the slot in the shaft must be parallel with the center line of the crankshaft. Remove the oil pump.

4. Remove the timing belt and the intermediate shaft sprocket.

5. Remove the shaft retainer bolts and remove the retainer from the block.

6. Remove the intermediate shaft from the engine.

7. If necessary, remove the front bushing using tool C-4697-2 and the rear bushing using tool C-4686-2.

To install:

8. Install the front bushing using tool C-4697-1 until the tool is flush with the block. Install the rear bushing using tool C-4686-1 until the tool is flush with the block.

9. Lubricate the distributor drive gear and install the intermediate shaft.

10. Replace the seal in the retainer and apply silicone sealer to the mating surface of the retainer. Install the retainer to the block and torque the bolts to 10 ft. lbs. (12 Nm).

11. Install the intermediate shaft sprocket and the timing belt.

12. With the timing belt properly installed, install the oil pump so the slot is parallel to the center line of the crankshaft. Install the distributor so the rotor is aligned with the No. 1 spark plug wire tower on the cap.

13. Install the fuel pump, if equipped.

14. Connect the negative battery cable and road test the vehicle.

Balance Shafts**REMOVAL & INSTALLATION****2.5L Engine**

1. Disconnect the negative battery cable. Raise the vehicle and support safely.

2. Remove the timing belt. Remove the oil pan, the oil pickup, the crankshaft belt sprocket and the front crankshaft oil seal retainer.

**Alignment of balance shaft sprockets—
2.5L engine**

3. Remove the balance shaft chain cover, the guide and the tensioner.

4. Remove the balance shaft sprocket to shaft bolt, the gear cover to balance shaft bolt and the crankshaft sprocket to crankshaft bolts, then the sprockets with the balance shaft chain.

5. Remove the front gear cover to carrier housing stud, the gear cover and the balance shaft drive gears.

6. Remove the rear gear cover to carrier housing bolts, the rear cover and the balance shafts from the rear of the carrier.

7. If necessary, remove the carrier housing to crankcase bolts and the housing.

To install:

8. If the carrier housing is being installed, torque the carrier housing to crankcase bolts to 40 ft. lbs. (54 Nm).

9. Rotate the balance shafts until the keyways are facing upward (parallel to the vertical centerline of the engine).

10. Install the short hub gear on the sprocket driven shaft and the long hub gear on the gear driven shaft; make sure the gear timing marks are aligned (facing each other).

11. Install the front gear cover and

Exploded view of the balance shafts and related parts—2.5L engine

2 CHRYSLER MID SIZE CARAVAN/VOYAGER/TOWN & COUNTRY • DAKOTA

torque the front gear cover to carrier housing stud bolt to 8.5 ft. lbs. (12 Nm).

12. Install the balance chain sprocket and torque the sprocket to crankshaft bolts to 11 ft. lbs. (13 Nm).

13. Rotate the crankshaft to position the No. 1 cylinder on the TDC of the compression stroke; the timing marks on the chain sprocket should align with the parting line on the left side of the No. 1 main bearing cap.

14. Position the balance shaft sprocket into the balance chain so the sprocket (yellow dot) timing mark mates with the yellow link on the chain.

15. Install the balance chain/sprocket assembly onto the crankshaft and the balance shaft. Torque the sprocket to shaft bolts to 21 ft. lbs. (28 Nm). If necessary to secure the crankshaft while tightening the bolts, place a block of wood between the crankcase and the crankshaft counterbalance.

16. Loosely install the chain tensioners and place a shim (0.039 in. $\times$ 2.75 in.) between the chain and the tensioner. Apply firm pressure (to reduce the chain slack) to the tensioner shoe. Torque the tensioner to front gear cover bolts to 8.5 ft. lbs. (12 Nm).

17. Install the chain cover and the rear cover to the carrier housing and torque the bolts to 8.5 ft. lbs. (12 Nm).

18. Replace the crankshaft retainer seal, apply silicone sealer to the mating surface and install the retainer.

19. Install the oil pickup and oil pan.

20. Install the crankshaft sprocket and the timing belt.

21. Connect the negative battery cable and road test the vehicle.

Adjusting the balance shaft chain tensioner—2.5L engine

Timing the balance shaft sprocket with the crankshaft sprocket—2.5L engine

Silent Shafts

REMOVAL & INSTALLATION

2.6L Engine

1. Disconnect the negative battery cable.

2. Matchmark the silent chain to the gears and remove the chain.

3. Remove the oil pump. The right silent shaft will come out with the pump. To remove the shaft from the pump, remove the retaining bolt from the pump and remove the shaft from the pump.

4. Remove the left silent shaft gear and spacer. Remove the thrust plate retaining screws and remove the thrust plate by installing two $\frac{1}{32}$ in. screws into the threaded holes and pulling the plate out.

5. Remove the silent shaft.

6. Install a new O-ring to the thrust plate.

Left silent shaft and related parts—2.6L engine

7. The installation is the reverse of the removal procedure. Torque the silent shaft retaining bolts to 25 ft. lbs. (34 Nm).

8. Connect the negative battery cable and road test the vehicle.

ENGINE LUBRICATION

Oil Pan

REMOVAL & INSTALLATION

Caravan, Voyager and Town & Country

2.2L AND 2.5L ENGINES

1. Disconnect the negative battery cable. Remove the oil dipstick.
2. Raise the vehicle and support safely.
3. Drain the engine oil.
4. Remove the engine to transaxle struts, if equipped.
5. Remove the torque converter or clutch inspection cover, if equipped.
6. Remove the oil pan retaining screws and remove the oil pan and the side seals.

To install:

7. Thoroughly clean and dry all sealing surfaces, bolts and bolt holes.
8. Apply silicone sealer to the 4 end seal to block corners and install the end seals making sure the corners are not twisted.
9. Apply silicone to the 4 pan to block corners. Install a new pan gasket or apply silicone sealer to the sealing surface of the pan and install to the engine making sure not to dislodge the end seals.
10. Install the retaining screws and torque to 17 ft. lbs. (23 Nm).
11. Install the torque converter inspection cover and engine to transaxle struts, if equipped. Lower the vehicle.
12. Install the dipstick. Fill the engine with the proper amount of oil.
13. Connect the negative battery cable and check for leaks.

2.6L, 3.0L AND 3.3L ENGINES

1. Disconnect the negative battery cable.
2. Raise the vehicle and support safely.
3. Remove the torque converter bolt access cover, if equipped.
4. Drain the engine oil.
5. Remove the oil pan retaining screws and remove the oil pan and gasket.

To install:

6. Thoroughly clean and dry all sealing surfaces, bolts and bolt holes.
7. Apply silicone sealer to the chain cover to block mating seam and the rear main seal retainer to block seam, if equipped.
8. Install a new pan gasket or apply silicone sealer to the sealing surface of the pan and install to the engine.

9. Install the retaining screws and torque to 50 inch lbs. (6 Nm) on 2.6L and 3.0L engines and 13 ft. lbs. (17 Nm) on 3.3L engine.

10. Install the torque converter bolt access cover, if equipped. Lower the vehicle.

11. Install the dipstick. Fill the engine with the proper amount of oil.

12. Connect the negative battery cable and check for leaks.

Dakota

2.2L AND 2.5L ENGINES

1. Disconnect the negative battery cable. Remove the oil dipstick.
2. Disconnect the air pump relief valve upper hose. Raise the vehicle and support safely.
3. Remove the clutch housing to engine strut and clutch inspection cover.
4. Remove the lower radiator hose support bracket.
5. Slightly loosen the right motor mount through bolt just enough to relieve the tension.
6. Using the proper equipment, support the weight of the engine. Loosen the left motor mount through bolt enough to clear the bracket.
7. Raise the left side of the engine about 2 inches.

8. Remove the oil pan retaining screws and remove the oil pan and gasket.

To install:

9. Thoroughly clean and dry all sealing surfaces, bolts and bolt holes.
10. Apply silicone sealer to the 4 end seal to block corners and install the end seals making sure the corners are not twisted.
11. Apply silicone to the 4 pan to block corners. Install a new pan gasket or apply silicone sealer to the sealing surface of the pan and install to the engine making sure not to dislodge the end seals.
12. Install the pan retaining screws and torque to 17 ft. lbs. (23 Nm).
13. Lower the engine. Torque the motor mount through bolts to 50 ft. lbs. (68 Nm).
14. Install the clutch inspection cover and housing to engine strut. Install the lower radiator hose support bracket. Lower the vehicle.
15. Install the dipstick and air pump hose. Fill the engine with the proper amount of oil.
16. Connect the negative battery cable and check for leaks.

3.9L ENGINE WITH 2WD

1. Disconnect the negative battery cable. Remove the oil dipstick. Disengage the distributor cap and remove it away from the firewall.
2. Raise the vehicle and support safely. Drain the engine oil.

3. Remove the exhaust crossover.

4. Loosen the motor mount bolts. Using the proper equipment, raise the engine. When the engine is high enough, install replacement bolts (similar in size to the motor mount bolts), in the engine mount attaching points on the frame brackets. Lower the engine so the bottom of the motor mounts rest on the 2 replacement bolts. Remove the torque converter inspection cover, if equipped.

5. Remove the oil pan retaining screws and remove the oil pan and gaskets.

To install:

6. Thoroughly clean and dry all sealing surfaces, bolts and bolt holes.
7. Place a drop of silicone sealer to the timing chain cover to block mating seam.
8. Install the new gaskets to the engine and add a drop of silicone sealer to the corners where the rubber and cork meet. Install the rubber seals to the pan.
9. Install the pan to the engine and torque the retaining screws to 17 ft. lbs. (23 Nm). Install the torque converter inspection cover, if equipped.
10. Reinstall the engine to the mount and install the exhaust crossover. Lower the vehicle.
11. Install the distributor cap.
12. Install the dipstick. Fill the engine with the proper amount of oil.
13. Connect the negative battery cable and check for leaks.

3.9L ENGINE WITH 4WD

1. Disconnect the negative battery cable. Remove the oil dipstick.
2. Raise the vehicle and support safely.
3. Using the proper equipment, support the weight of the engine. Remove the front driving axle.
4. Remove the exhaust crossover and the lower transmission cover.
5. Remove the oil pan retaining screws and remove the oil pan and gaskets.

To install:

6. Thoroughly clean and dry all sealing surfaces, bolts and bolt holes.
7. Place a drop of silicone sealer to the timing chain cover to block mating seam.
8. Install the new gaskets to the engine and add a drop of silicone sealer to the corners where the rubber and cork meet. Install the rubber seals to the pan.
9. Install the pan to the engine and torque the retaining screws to 17 ft. lbs. (23 Nm). Install the lower transmission cover, if equipped.
10. Install the exhaust crossover.
11. Install the front driving axle. Lower the vehicle.

Aligning the slot in the oil pump shaft—2.2L and 2.5L engines

12. Install the dipstick. Fill the engine with the proper amount of oil.

13. Connect the negative battery cable and check for leaks.

Oil Pump

REMOVAL & INSTALLATION

2.2L and 2.5L Engines

1. Crank the engine around so that the No. 1 piston is at TDC. Disconnect the negative battery cable.

2. Matchmark the rotor to the block and remove the distributor to confirm that the slot in the oil pump shaft is parallel to the centerline of the crankshaft. Matchmark the slot to the distributor bore, if desired.

3. Remove the dipstick. Raise the vehicle and support safely. Drain the engine oil and remove the pan.

4. Remove the oil pickup.

5. Remove the 2 mounting bolts and remove the oil pump from the engine.

To install:

6. Prime the pump by pouring fresh oil into the pump intake and turning the driveshaft until oil comes out the pressure port. Repeat a few times until no air bubbles are present.

7. Apply sealer (Loctite® 515, or equivalent) to the pump body to block machined surface interface. Lubricate the oil pump and distributor driveshaft.

8. Align the slot so it will be in the same position as when it was removed. If it is not, the distributor will not be timed correctly. Install the pump fully and rotate back and forth to ensure proper positioning between the pump mounting surface and the machined surface of the block.

9. Install the mounting bolts fingertight and lower the vehicle to confirm proper slot positioning. If the slot is not properly positioned, raise

the vehicle and move the gear as required. If the slot is correct, hold the pump firmly against the block and torque the mounting bolts to 17 ft. lbs. (23 Nm).

10. Clean out the oil pickup or replace as required. Replace the oil pickup O-ring and install the pickup to the pump.

11. Install the oil pan using new gaskets. Lower the vehicle.

12. Install the distributor.

13. Install the dipstick. Fill the engine with the proper amount of oil.

14. Connect the negative battery cable, check the timing and check the oil pressure.

2.6L Engine

1. Disconnect the negative battery cable. Remove the dipstick.

2. Drain the engine coolant and oil. Remove the oil pan and timing chain cover. Rotate the engine until all 3 silent chain gear marks are in a position to matchmark them to the corresponding chain link. Using different color paint, matchmark the chain to the gears. Remove the silent shaft chain. The lower guide bolts are also oil pump mounting bolts.

3. Remove the oil pump mounting bolts and remove the pump with the timing chain tensioner and the right side silent shaft.

4. Remove the silent shaft and its key from the oil pump.

To install:

5. Remove the gasket material from the block.

6. Prime the pump by pouring fresh oil into the pump intake and turning the driveshaft until oil comes out the pressure port. Repeat a few times until no air bubbles are present.

7. Install the silent shaft key to the oil pump and install the silent shaft itself to the pump.

8. Install the timing chain tensioner and spring to its bore in the pump. Make sure the rubber washer is installed on the tensioner and is not damaged. If it is, the timing chain will make noise.

9. Install the new gasket to the pump and install the pump to the block engaging the tensioner with the timing chain. Make sure the dowels are seated in their bores. Torque the mounting bolts to 13 ft. lbs. (18 Nm).

10. Install the silent shaft chain aligning the matchmarks.

11. Remove the oil pickup and clean or replace, as required. Reinstall with a new gasket.

Oil pump and pickup assemblies—2.6L engine

12. Install the timing chain cover, oil pan and all related parts.
13. Install the dipstick. Fill the engine with the proper amount of oil.
14. Connect the negative battery cable and check the oil pressure.

3.0L Engine

1. Disconnect the negative battery cable. Remove the dipstick.
2. Raise the vehicle and support safely. Remove the timing belt, drain the engine oil and remove the oil pan from the engine. Remove the oil pickup.
3. Remove the oil pump mounting bolts and remove the pump from the front of the engine. Note the different length bolts and their position in the pump for installation.

To install:

4. Clean the gasket mounting surfaces of the pump and engine block.
5. Prime the pump by pouring fresh oil into the pump and turning the rotors or, using petroleum jelly, pack the inside of the oil pump. Using a new gasket, install the oil pump on the engine and torque all bolts to 11 ft. lbs. (15 Nm).
6. Install the balancer and crankshaft sprocket to the end of the crankshaft.
7. Clean out the oil pickup or replace as required. Replace the oil pickup gasket ring and install the pickup to the pump.
8. Install the timing belt, oil pan and all related parts.
9. Install the dipstick. Fill the engine with the proper amount of oil.
10. Connect the negative battery cable and check the oil pressure.

Exploded view of the oil pump—3.0L engine

Oil pump components—3.3L engine

Exploded view of the oil pump—3.9L engine

12. Connect the negative battery cable and check the oil pressure.

3.9L Engine

1. Disconnect the negative battery cable.
2. Raise the vehicle and support safely. Drain the oil and remove the oil pan.
3. Remove the screen.
4. Unbolt the oil pump from the rear main bearing cap and remove it from the vehicle.

To install:

5. Prime the pump by pouring fresh oil into the pump intake and turning the driveshaft until oil comes out the

pressure port. Repeat a few times until no air bubbles are present. Install the oil pump with a rotating motion to ensure proper pump driveshaft engagement.

6. Hold the pump flush against the main cap and finger tighten the attaching bolts.

7. Torque the bolts to 30 ft. lbs. (41 Nm).

8. Install the screen.

9. Install the oil pan with a new gasket.

10. Connect the negative battery cable and check the oil pressure.

CHECKING

2.2L and 2.5L Engines

1. Remove the cover from the oil pump.

2. Check endplay of the inner rotor using a feeler gauge and a straight edge placed across the pump body. The specification is 0.001–0.004 in. (0.03–0.09mm).

3. Measure the clearance between the inner and outer rotors. The maximum clearance is 0.008 in. (0.20mm).

4. Measure the clearance between the outer rotor and the pump body. The maximum clearance is 0.014 in. (0.35mm).

5. The minimum thickness of the outer rotor is 0.944 in. (23.96mm). The minimum diameter of the outer rotor is 2.77 in. (62.70mm). The minimum thickness of the inner rotor is 0.943 in. (23.95mm).

6. Check the cover for warpage. The maximum allowable is 0.003 in. (0.076mm).

7. Check the pressure relief valve for damage. The spring's frelength specification is 1.95 in. (49.50mm).

8. Assemble the outer rotor with the larger chamfered edge in the pump body. Torque the cover screws to 10 ft. lbs. (12 Nm).

2.6L Engine

1. Remove the cover from the oil pump.

2. Measure the clearance between the gears and their bearings. The specification for both is 0.0008–0.0020 in. (0.02–0.05mm).

3. Check the clearance between the gears and the housing. The specification for both gears is 0.004–0.006 in. (0.11–0.15mm).

4. Check endplay of the gears using a feeler gauge and a straight edge placed across the pump body. The specification for both is 0.002–0.004 in. (0.04–0.11mm).

5. Check the pressure relief valve for damage. The spring's frelength specification is 1.85 in. (47.00mm).

6. If the gears were removed from the body, install them with the mating aligned. If they are not aligned properly, the silent shaft will be out of time.

7. Torque the cover screws to 13 ft. lbs. (18 Nm).

3.0L Engine

1. Remove the rear cover.

2. Remove the pump rotors and inspect the case for excessive wear.

3. Measure the diameter of the inner rotor hub that sits in the case. Measure the inside diameter of the inner rotor hub bore. Subtract the first measurement from the second; if the result is over 0.006 in. (0.15mm), replace the oil pump assembly.

4. Measure the clearance between the outer rotor and the case. The specification is 0.004–0.007 in. (0.10–0.18mm).

5. Check the side clearance of the rotors using a feeler gauge and a straightedge placed across the case. The specification is 0.0015–0.0035 in. (0.04–0.09mm).

6. Check the relief plunger and spring for damage and breakage.

7. Install the rear cover to the case.

3.3L Engine

1. Thoroughly clean and dry all parts. The mating surface of the chain case cover should be smooth. Replace the pump cover if it is scratched or grooved.

2. Lay a straightedge across the pump cover surface. If a 0.003 in. (0.076mm) feeler gauge can be inserted between the cover and straightedge, the cover should be replaced.

3. The minimum thickness of the outer rotor is 0.301 in. (7.63mm). The minimum diameter of the outer rotor is 3.14 in. (79.78mm). The minimum

Alignment of the oil pump gear mating marks—2.6L engine

thickness of the inner rotor is 0.301 in. (7.64mm).

4. Install the outer rotor onto the chain case cover, press to one side and measure the clearance between the rotor and case. If the measurement exceeds 0.022 in. (56mm) and the rotor is good, replace the chain case cover.

5. Install the inner rotor to the chain case cover and measure the clearance between the rotors. If the clearance exceeds 0.008 in. (0.203mm), replace both rotors.

6. Place a straightedge over the chain case cover between bolt holes. If a 0.004 in. (0.102mm) thick feeler gauge can be inserted under the straightedge, replace the pump assembly.

7. Inspect the relief valve plunger for scoring and freedom of movement. Small marks may be removed with 400-grit wet or dry sandpaper.

8. The relief valve spring should have a frelength of 1.95 in.

9. Assemble the pump using new parts where necessary.

3.9L Engine

1. Disassemble the pump.

2. Replace the pump assembly if the cover is scratched or grooved or if the cover is warped more than 0.0015 in. (0.038mm).

3. The minimum thickness of the outer rotor is 0.825 in. (20.96mm). The minimum diameter of the outer rotor is 2.469 in. (62.70mm). The minimum thickness of the inner rotor is 0.825 in. (20.96mm). If any of the above measurements are not within specifications, replace the shaft and both rotors.

4. The maximum clearance between the outer rotor and the pump body is 0.014 in. (0.356mm). Replace the pump assembly if not within specifications.

5. Install the inner rotor and place a

straightedge across the bolt holes. If a feeler gauge of 0.004 in. (0.101mm) or more fits, replace the pump assembly.

6. The maximum clearance between the rotors is 0.010 in. (0.254mm). Replace the shaft and both rotors if not within specifications.

7. Inspect the relief valve plunger for scoring. Small marks may be removed with 400-grit wet or dry sandpaper.

8. The relief valve spring should have a frelength of about 2 in. Replace the spring if it fails to meet specifications.

9. Assemble the pump using new parts where necessary.

Rear Main Bearing Oil Seal

REMOVAL & INSTALLATION

Except 3.9L Engine

1. Disconnect the negative battery cable.

2. Remove the transmission or transaxle. Remove the flywheel or flexplate.

3. If there is any leakage coming from the rear seal retainer, drain the engine oil and remove the oil pan, if necessary. Remove the rear main oil seal retainer.

4. Remove the seal from the retainer.

To install:

5. Lightly coat the seal outer diameter with Loctite® Stud N' Bearing Mount, or equivalent.

6. Install the seal to the retainer.

7. If the retainer was removed, thoroughly clean and dry the retainer to block sealing surfaces and install a new gasket or apply silicone sealer and install the retainer. Install the pan, if it was removed.

8. Install the flywheel or flexplate and the transmission or transaxle.

9. Connect the negative battery cable and check for leaks.

3.9L Engine

1. Raise the vehicle and support safely. Drain the engine oil. Remove the oil pan and oil pump.

2. Remove the rear main bearing cap.

3. Remove the lower seal from the cap.

4. To remove the upper rope seal, use oil seal remover and installer kit KD-492, or equivalent, following the instructions provided with the tool.

To install:

5. Wipe the crankshaft surface clean and coat it lightly with oil.

6. Use oil seal remover and installer

kit KD-492, or equivalent to install the upper rope seal. Trim the ends of the upper seal to eliminate frayed ends.

7. Install the lower rope seal in the main cap so that both ends protrude. Use tool C-3511 to seat the seal in its groove. Cut off the portions of the seal that extend above the cap on both sides and install the end seals to the cap.

8. Install the main cap to the block and torque the bolts to 85 ft. lbs. (115 Nm).

9. Install the pan and fill the engine with the proper amount of oil.

10. Connect the negative battery cable and check for leaks.

Removing or installing the shifter assembly — Dakota with NP-2500 transfer case

MANUAL TRANSMISSION

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

Transmission Assembly

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Shift the transmission into Neutral and remove the upper shift lever.

3. Raise the vehicle and support safely. Remove the skid plate(s), if equipped. Drain the transmission lubricant.

4. Matchmark and remove the driveshaft(s).

5. Disconnect the wires from the distance sensor, if equipped. Then loosen the sensor coupling and remove the sensor from the speedometer adaptor.

6. Disconnect the reverse light switch. Remove the transfer case, if equipped.

7. Install engine support fixture C-3487-A, or equivalent to support the engine while the transmission is out of the vehicle. Raise the engine slightly with the support fixture.

8. Disconnect the insulator from the extension housing.

9. Using the proper equipment, support the transmission and remove the crossmember.

10. Remove the transmission to clutch housing bolts.

11. Slide the transmission rearward

until the input shaft clears the clutch disc.

12. Pull the transmission completely away from the clutch housing and remove the transmission from the vehicle.

To install:

13. Lubricate the pilot bushing and input shaft splines very lightly with high temperature lubricant.

14. Mount the transmission securely on a suitable transmission jack and lift it in place until the input shaft is centered in the clutch housing opening. Roll the transmission forward until the input shaft splines fully engage with the clutch disc.

15. Install the transmission to clutch housing bolts. Torque the bolts to 50 ft. lbs. (68 Nm).

16. Install the transmission crossmember. Remove the transmission and engine support fixtures.

17. Install the transfer case, if equipped and connect all linkage, electrical connectors and vacuum lines to the transfer case.

18. Connect the reverse light switch connector and clip all wiring to the transmission case.

19. Connect speedometer cable and distance sensor, if equipped.

20. Install the driveshaft(s).

21. Fill the transmission with the proper amount of 10W-30 engine oil with an API classification SG/CD. Fill the transfer case, if equipped, with the proper amount of Dexron® II lubricant.

22. Apply silicone sealer to the pe-

Manual transmission wiring harness routing — NP-2500 transfer case

rimeter of the shifter base and install the shifter assembly.

23. Install the skid plate(s), if equipped.

24. Connect the negative battery cable and check the transmission for proper operation.

MANUAL TRANSAXLE

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

Transaxle Assembly REMOVAL & INSTALLATION

NOTE: If the vehicle is going to be rolled while the transaxle is out of the vehicle, obtain 2 outer CV joints to install to the hubs. If the vehicle is rolled without the proper torque applied to the front wheel bearings, the bearings will be destroyed.

1. Disconnect the negative battery cable.

2. Remove the air cleaner assembly if it is preventing access to the upper bell housing bolts. Remove the upper bell housing bolts. Disconnect the reverse light switch and the ground wire.

3. Remove the starter attaching nut and bolt at the top of the bell housing.

4. Raise the vehicle and support safely. Remove the tire and wheel assemblies. Remove the axle end cotter pins, nut locks, spring washers and axle nuts.

5. Remove the ball joint retaining bolts and pry the control arm from the steering knuckle. Position a drainpan under the transaxle where the axles enter the differential or extension housing. Remove the axles from the transaxle or center bearing. Unbolt the center bearing and remove the intermediate axle from the transaxle, if equipped.

6. Remove the anti-rotation link from the crossmember. Disconnect the shifter cables from the transaxle and unbolt the cable bracket.

7. Remove the speedometer cable adaptor bolt and remove the adaptor from the transaxle.

8. Remove the rear mount from the starter, unbolt the starter and position it to the side.

9. Using the proper equipment, support the weight of the engine.

10. Remove the front motor mount and bracket.

11. Position a suitable transaxle jack under the transaxle.

12. Remove the lower bell housing bolts.

13. Remove the left side splash shield. Remove the transaxle mount bolts.

14. Carefully pry the transaxle from the engine.

15. Slide the transaxle rearward until the input shaft clears the clutch disc.

16. Pull the transaxle completely away from the clutch housing and remove from the vehicle.

17. To prepare the vehicle for rolling, support the engine with a suitable support or reinstall the front motor mount to the engine. Then reinstall the ball joints to the steering knuckle and install the retaining bolt. Install the obtained outer CV joints to the hubs, install the washers and torque the axle nuts to 180 ft. lbs. (244 Nm). The vehicle may now be safely rolled.

To install:

18. Lubricate the pilot bushing and input shaft splines very lightly with high temperature lubricant.

19. Mount the transaxle securely on a suitable jack and install the left side mount bolts. Lift it in place until the input shaft is centered in the clutch housing opening. Roll the transaxle forward until the input shaft splines fully engage with the clutch disc.

20. Install the transaxle to clutch housing bolts.

21. Jack the transaxle up and install the front motor mount and bracket.

22. Remove the engine and transaxle support fixtures.

23. Install the starter to the transaxle and install the lower bolt fingertight.

24. Install a new O-ring to the speedometer cable adaptor and install to the extension housing; make sure it snaps in place. Install the retaining bolt.

25. Install the shift cable bracket and snap the cable ends in place. Install the anti-rotation link.

26. Install the axles and center bearing, if equipped. Install the ball joints to the steering knuckles. Torque the axle nuts to 180 ft. lbs. (244 Nm) and install new cotter pins. Fill the transaxle with SAE 5W-30 engine oil. Install the splash shield and install the wheels. Lower the vehicle.

27. Install the upper bell housing bolts.

28. Install the starter attaching nut and bolt at the top of the bell housing. Raise the vehicle again and tighten the starter bolt from underneath the vehicle. Lower the vehicle.

29. Connect the reverse light switch and the ground wire.

30. Install the air cleaner assembly, if it was removed.

31. Connect the negative battery cable and check the transaxle for proper operation.

CABLE ADJUSTMENT

1. Working over the left front fender, remove the lock pin from the transaxle selector shaft housing.

2. Reverse the lock pin (long end down) and insert it into the same threaded hole while pushing the selector shaft into the selector housing. A hole in the selector shaft will align with the lock pin, allowing the lock pin to be screwed into the housing. This operation locks the selector shaft in the neutral position between either 1st and 2nd gears or 3rd and 4th gears.

3. Remove the gearshift knob, the retaining nut and the pull-up ring from the gearshift lever.

4. If necessary, remove the shift lever boot and console to expose the gearshift linkage.

5. Fabricate 2 cable adjusting pins: $\frac{3}{16}$ in. diameter $\times$ 5 in. long with a $\frac{1}{2}$ in. 90 degrees bend at one end.

6. Place a pin in the hole provided at the right side and the other in the hole provided at the rear side of the shifting mechanism (make sure the alignment holes match). Torque the selector (right side) and the crossover (left side) adjusting bolts to 4-5 ft. lbs.

7. Remove the lock pin from the selector shaft housing and reinstall the lock pin (with the long end up) in the selector shaft housing. Torque the lock pin to 10 ft. lbs. (12 Nm).

8. Check the first/reverse shifting and blackout into reverse.

9. Reinstall the console, boot, pull-up ring, retaining nut and knob.

CLUTCH

Clutch Assembly

REMOVAL & INSTALLATION

Caravan and Voyager

1. Disconnect the negative battery cable. Remove the transaxle.

2. Matchmark the clutch/pressure plate cover and flywheel. Insert a suitable clutch plate alignment tool into the clutch disc hub.

3. Loosen the flywheel to pressure plate bolts gradually and evenly to avoid warpage.

4. Remove the pressure plate/clutch assembly from the flywheel.

5. Sand the flywheel or replace it if it is scored, cracked or heat damaged.

6. Sparingly apply anti-sieze compound to the input shaft and clutch disc splines. Install a new release bearing.

7. The installation is the reverse of the removal procedure. Use the clutch disc alignment tool when tightening the pressure plate bolts to center the disc. Torque the pressure plate/clutch assembly mounting bolts to the flywheel gradually and evenly to 21 ft. lbs. (28 Nm).

Dakota

1. Disconnect the negative battery cable.

2. Raise the vehicle and support safely.

3. Remove the transmission and transfer case, if equipped.

4. Remove the inspection cover at the bottom of the bell housing.

5. Rotating the engine with a flywheel turner, remove the clutch cover bolts gradually as they appear.

6. Remove the clutch cover and disc by lowering it through the opening at the bottom of the housing.

To install:

7. Sparingly apply anti-sieze compound to the input shaft and clutch disc splines. Install a new release bearing.

8. Raise the clutch cover and disc into place and use a suitable clutch aligning tool or spare input shaft to center the disc. Tighten all of the bolts finger tight.

9. The cover bolts must be turned gradually, evenly and to the proper torque to avoid distorting the cover. Torque the bolts to 21 ft. lbs. (28 Nm).

10. Install the transmission and transfer case, if equipped.

11. Install the inspection cover.

12. Connect the negative battery cable and check the clutch for proper operation.

PEDAL FREE-PLAY ADJUSTMENT

NOTE: The Caravan and Voyager are equipped with a self-adjusting cable operated mechanism and no adjustment is provided. The Dakota has been equipped with a hydraulic clutch release system since its inception. There is no adjustment for free-play on this system.

Clutch Cable

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the clip from the cable mounting bracket on the shock tower and remove the cable from the bracket.

3. Remove the retainer from the clutch release lever on the transaxle.

4. Pry out the ball end of the cable from the position adjuster inside the pedal.

5. The installation is the reverse of the removal procedure. After installing, push the clutch pedal 2 or 3 times to allow the self-adjuster mechanism to function.

Clutch Master Cylinder and Slave Cylinder

The clutch master cylinder, remote reservoir, slave cylinder and connecting lines are all serviced as a complete assembly. The cylinders and connecting lines are sealed units. They are prefilled with fluid from the factory and cannot be disassembled or serviced separately.

Clutch pedal, cable and related parts—Caravan and Voyager

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Raise the vehicle and support safely.

3. Remove the nuts attaching the slave cylinder to the bell housing.

4. Remove the slave cylinder and clip from the housing.

5. Lower the vehicle.

6. Remove the locating clip from the clutch master cylinder mounting bracket.

7. Remove the retaining ring, flat washer and wave washer that attach the clutch master cylinder pushrod to the clutch pedal. Slide the pushrod off of the pedal pin. Inspect the bushing on the pedal pin and replace if it is excessively worn.

8. Verify that the cap on the clutch master cylinder reservoir is tight so that fluid will not spill during removal.

9. Remove the screws attaching the reservoir and bracket to the dash panel and remove the reservoir.

10. Pull the clutch master cylinder rubber seal from the dash panel.

11. Rotate the clutch master cylinder 45 degrees to unlock it. Remove the cylinder from the dash panel.

12. Remove the clutch master cylinder, remote reservoir, slave cylinder and connecting lines from the vehicle.

To install:

13. Verify that the cap on the fluid reservoir is tight so that fluid will not spill during installation.

14. Position the components in the replacement kit in their places on the vehicle.

15. Insert the master cylinder in the dash. Rotate it 45 degrees to lock it in place.

16. Lubricate the rubber seal with a suitable lubricant to ease installation. Seat the seal around the cylinder in the dash.

17. Install the fluid reservoir and bracket, if equipped, to the dash panel.

18. Install the master cylinder pushrod to the clutch pedal pin. Secure the rod with the wave washer, flat washer and retaining ring. Install the locating clip. Do not remove the plastic shipping stop from the pushrod until the slave cylinder has been installed.

19. Raise the vehicle and support safely.

20. Insert the slave cylinder pushrod through the opening and make sure the cap on the end of the pushrod is securely engaged in the release lever before tightening the attaching nuts. Torque the nuts to 17 ft. lbs. (23 Nm).

21. Lower the vehicle. Remove the plastic shipping stop from the master cylinder pushrod.

22. Operate the clutch pedal a few

Clutch hydraulic linkage components—Dakota

times to verify proper operation of the system.

23. Connect the negative battery cable and road test the vehicle.

AUTOMATIC TRANSMISSION

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

Transmission Assembly

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Raise the vehicle and support safely. Drain the transmission and transfer case, if equipped.

3. Remove the exhaust crossover pipe.

4. Remove the skid plates, if equipped.

5. Matchmark and remove the driveshaft(s).

6. Disconnect the distance sensor, if equipped and the speedometer cable.

7. If equipped with 4WD, disconnect all linkage, electrical connectors and vacuum lines from the transfer case. Using a suitable jack, support the transfer case, unbolt the transfer case

from the transmission and slide it backwards to remove it from the vehicle.

8. Remove the engine to transmission struts.

9. Remove the starter and the fluid cooler lines bracket.

10. Remove the torque converter inspection cover.

11. Matchmark the converter to the flex plate. Remove the torque converter bolts.

12. Disconnect the wires to the neutral safety switch and lockup solenoid, if equipped.

13. Disconnect and plug the oil cooler lines from the transmission.

14. Disconnect the gearshift rod and torque shaft assembly from the transmission.

15. Disconnect the throttle rod from the lever.

16. Unbolt the oil filler tube brace and lift the oil filler tube out of its bore.

17. Install an appropriate engine support fixture to hold the engine in place when the transmission is out of the vehicle.

18. Raise the transmission slightly using a suitable transmission jack.

19. Remove the transmission crossmember.

20. Remove the oil filter, if necessary. Remove all bell housing bolts and remove the transmission from the vehicle.

To install:

21. Install the transmission securely on the transmission jack. Rotate the converter so it will align with the positioning of the flex plate.

22. Apply a coating of high tempera-

ture grease to the torque converter pilot hub.

23. Raise the transmission into place and push it forward until the dowels engage and the bell housing is flush with the block.

24. Install the oil filler tube. Install the bell housing bolts and torque to 30 ft. lbs. (41 Nm). Install the oil filter, if it was removed.

25. Install the transmission cross-member. Remove the engine support fixture and the transmission jack.

26. Install the torque converter bolts and torque to 23 ft. lbs. (31 Nm).

27. Connect the oil cooler lines.

28. Connect the throttle rod to the lever and adjust if necessary.

29. Connect the gearshift rod and torque shaft assembly to the transmission and adjust if necessary.

30. Connect the wires to the neutral safety switch and lockup solenoid, if equipped. Make sure all wires are routed correctly and clipped in place.

31. Install the torque converter inspection cover, starter and transmission struts.

32. Install the transfer case, if equipped.

33. Connect the distance sensor, if equipped.

34. Connect the the speedometer cable.

35. Install the driveshaft(s).

36. Install exhaust parts that were removed in order to remove the transmission.

37. Fill the transfer case, if equipped. Lower the vehicle.

38. Connect the negative battery cable.

39. Fill the transmission with the proper amount of Dexron®II.

40. Road test the vehicle, check for leaks and recheck the fluid level.

SHIFT LINKAGE ADJUSTMENT

NOTE: Do not attempt to adjust the linkage if any of the parts are excessively worn. If any rods are removed from the plastic grommets, new grommets should be installed. Pry only where the grommet and rod attach, not on the rod itself. Use pliers to snap the rod into the new grommet.

1. Shift the transmission into P.

2. Raise the vehicle and support safely.

3. Loosen the shift rod adjusting swivel lock screw. Make sure the swivel turns freely on the rod.

4. Make sure the valve body is in the P position by moving it all the way rearward.

5. Adjust the swivel position on the shift rod to obtain a free pin fit in the torque shaft lever. Tighten the lock screw.

6. If the vehicle starts in any gear other than P or N, or does not start in both P and N, then either the adjustment is wrong or another problem exists.

THROTTLE LINKAGE ADJUSTMENT

1. If the vehicle is carbureted, perform the adjustment with the engine at normal operating temperature and off of the fast idle cam.

2. If the vehicle is fuel injected, retract the ISC actuator by doing one of the following:

a. If the DRBII is available, connect its connector to the diagnostic connector. Start the engine and place the DRBII in the "Throttle Body Minimum Air Flow Test" mode. Disconnect the electrical connector on the ISC actuator. Shut off the engine and disconnect the DRBII; the actuator is now fully retracted.

b. If the DRBII is not available, 2 jumper wires may be used. With the engine off, disconnect the connector to the ISC actuator. Connect a pair of jumper wires to the battery. Connect the negative jumper to the top pin of the ISC actuator and the positive jumper to the other pin. Do not leave the jumpers connected for more than 5 seconds. Disconnect the jumpers and the ISC actuator is fully retracted.

3. Raise the vehicle and support safely.

4. Loosen the adjustable swivel lock screw on the throttle rod enough so the rod travels freely in the swivel.

5. Hold the throttle lever firmly forward against its internal stop and tighten the lock screw. Lower the vehicle.

6. Reconnect the ISC actuator, if equipped.

7. If equipped with fuel injection, turn the ignition key to the RUN position for at least 5 seconds, but do not start the engine. Turn the key to the OFF position.

8. Start the engine and road test the vehicle.

AUTOMATIC TRANSAXLE

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

Transaxle Assembly

REMOVAL & INSTALLATION

NOTE: If the vehicle is going to be rolled while the transaxle is out of the vehicle, obtain 2 outer CV joints to install to the hubs. If the vehicle is rolled without the proper torque applied to the front wheel bearings, the bearings will be destroyed.

1. Disconnect the negative battery cable. If equipped with 3.0L or 3.3L engine, drain the coolant. Remove the dipstick.

2. Remove the air cleaner assembly if it is preventing access to the upper bell housing bolts. Remove the upper bell housing bolts and water tube, where applicable. Unplug all electrical connectors from the transaxle.

3. If equipped with a 2.2L or 2.5L engine, remove the starter attaching nut and bolt at the top of the bell housing.

4. Raise the vehicle and support safely. Remove the tire and wheel assemblies. Remove the axle end cotter pins, nut locks, spring washers and axle nuts.

5. Remove the ball joint retaining bolts and pry the control arm from the steering knuckle. Position a drainpan under the transaxle where the axles enter the differential or extension housing. Remove the axles from the transaxle or center bearing. Unbolt the center bearing and remove the intermediate axle from the transaxle, if equipped.

6. Drain the transaxle. Disconnect and plug the fluid cooler hoses. Disconnect the shifter and kickdown linkage from the transaxle, if equipped.

7. Remove the speedometer cable adaptor bolt and remove the adaptor from the transaxle.

8. Remove the starter. Remove the torque converter inspection cover, matchmark the torque converter to the flexplate and remove the torque converter bolts.

9. Using the proper equipment, support the weight of the engine.

10. Remove the front motor mount and bracket.

11. Position a suitable transaxle jack under the transaxle.

12. Remove the lower bell housing bolts.

13. Remove the left side splash shield. Remove the transaxle mount bolts.

14. Carefully pry the transaxle from the engine.

15. Slide the transaxle rearward un-

til dowels disengage from the mating holes in the transaxle case.

16. Pull the transaxle completely away from the engine and remove from the vehicle.

17. To prepare the vehicle for rolling, support the engine with a suitable support or reinstall the front motor mount to the engine. Then reinstall the ball joints to the steering knuckle and install the retaining bolt. Install the obtained outer CV joints to the hubs, install the washers and torque the axle nuts to 180 ft. lbs. (244 Nm). The vehicle may now be safely rolled.

To install:

18. Install the transmission securely on the transmission jack. Rotate the converter so it will align with the positioning of the flex plate.

19. Apply a coating of high temperature grease to the torque converter pilot hub.

20. Raise the transaxle into place and push it forward until the dowels engage and the bell housing is flush with the block.

20. Install the transaxle to bell housing bolts.

21. Jack the transaxle up and install the left side mount bolts. Install the torque converter bolts and torque to 55 ft. lbs. (74 Nm).

22. Install the front motor mount and bracket. Remove the engine and transaxle support fixtures.

23. Install the starter to the transaxle. Install the bolt finger tight if equipped with a 2.2L or 2.5L engine.

24. Install a new O-ring to the speedometer cable adaptor and install to the extension housing; make sure it snaps in place. Install the retaining bolt.

25. Connect the shifter and kickdown linkage to the transaxle, if equipped.

26. Install the axles and center bearing, if equipped. Install the ball joints to the steering knuckles. Torque the axle nuts to 180 ft. lbs. (244 Nm) and install new cotter pins. Install the splash shield and install the wheels. Lower the vehicle. Install the dipstick.

27. Install the upper bell housing bolts and water pipe, if removed.

28. If equipped with 2.2L or 2.5L engine, install the starter attaching nut and bolt at the top of the bell housing. Raise the vehicle again and tighten the starter bolt from underneath the vehicle. Lower the vehicle.

29. Connect all electrical wiring to the transaxle.

30. Install the air cleaner assembly, if it was removed. Fill the transaxle with the proper amount of Dexron®II.

31. Connect the negative battery cable and check the transaxle for proper operation.

UPSHIFT AND KICKDOWN LEARNING PROCEDURE

A-604 Ultradrive Transaxle

In 1989, the A-604 4 speed, electronic transaxle was introduced; it is the first to use fully adaptive controls. The controls perform their functions based on real time feedback sensor information. Although, the transaxle is conventional in design, its functions are controlled by the ECM.

Since the A-604 is equipped with a learning function, each time the battery cable is disconnected, the ECM memory is lost. In operation, the transaxle must be shifted many times for the learned memory to be reinput in the ECM; during this period, the vehicle will experience rough operation. The transaxle must be at normal operating temperature when learning occurs.

1. Maintain constant throttle opening during shifts. Do not move the accelerator pedal during upshifts.

2. Accelerate the vehicle with the throttle $\frac{1}{8}$ – $\frac{1}{2}$ open.

3. Make 15 to 20 $\frac{1}{2}$, $\frac{2}{3}$ and $\frac{3}{4}$ upshifts. Accelerating from a full stop to 50 mph each time at the aforementioned throttle opening is sufficient.

4. With the vehicle speed below 25 mph, make 5 to 8 wide open throttle kickdowns to 1st gear from either 2nd or 3rd gear. Allow at least 5 seconds of operation in 2nd or 3rd gear prior to each kickdown.

5. With the vehicle speed greater than 25 mph, make 5 to part throttle to wide open throttle kickdowns to either 3rd or 2nd gear from 4th gear. Allow at least 5 seconds of operation in 4th gear, preferably at road load throttle prior to performing the kickdown.

SHIFT LINKAGE ADJUSTMENT

1. Place the shifter in the P detent.

2. Loosen the clamp bolt on the gearshift cable bracket.

3. Pull the shift lever all the way to the front detent position and tighten the lock screw.

4. Check for proper neutral safety switch operation.

THROTTLE PRESSURE CABLE ADJUSTMENT

1. Run the engine until it reaches normal operating temperature.

2. Loosen the cable mounting bracket lock screw.

3. Position the bracket so that both alignment tabs are touching the transaxle case surface and tighten the lock screws.

4. Release the cross lock on the cable assembly by pulling the cross lock up.

5. To ensure proper adjustment, the cable must be free to slide all the way toward the engine against its stop after the cross lock is released.

6. Move the transaxle throttle control lever fully clockwise and press the cross lock down until it snaps into position.

7. Road test the vehicle and check the shift points.

THROTTLE PRESSURE ROD ADJUSTMENT

1. Run the engine until it reaches normal operating temperature.

2. Loosen the adjustment swivel lock screw.

3. To ensure proper adjustment, the swivel must be free to slide along the flat end of the throttle rod. Disassembly, clean and lubricate as required.

4. Hold the transaxle throttle control lever firmly toward the engine and tighten the swivel screw.

5. Road test the vehicle and check the shift points.

TRANSFER CASE

Transfer Case Assembly

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Raise the vehicle and support safely.

3. Remove the skid plates, if equipped. Drain the transfer case fluid.

4. Disconnect the distance sensor, if equipped and disconnect the speedometer cable from the transfer case.

5. Matchmark and remove the driveshafts.

6. Disconnect the PTO, if equipped.

7. Disconnect the linkage, electrical connectors and vacuum lines from the transfer case. Using a suitable jack, support the transfer case and remove the crossmember.

8. Unbolt the transfer case from the transmission and slide it backwards to remove it from the vehicle.

9. The installation is the reverse of the removal procedure. Torque the transfer case to transmission case nuts to 26 ft. lbs. (35 Nm). Fill the transfer case with Dexron®II.

LINKAGE ADJUSTMENT

1. Move the transfer case shift lever boot aside for access to the shift lever and gate.
2. Move the shift lever into the **2H** position on 1987 vehicles or the **4H** position on 1988-90 vehicles. Make sure the lever is against the appropriate gate. Insert a 1/8 inch spacer between the shift lever and gate and secure the lever with tape.
3. Raise the vehicle and support safely.
4. Loosen the shift rod clamp screw until the shift rod is free to slide in the swivel.
5. Verify that the lever is in the **2H** or **4H** (depending on year); position and move it if it has moved out of position.
6. Tighten the clamp screw.
7. Check the smoothness of operation of the transfer case.

DRIVE AXLE

Halfshaft

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Raise the vehicle and support safely.
3. Remove the tire and wheel assembly.
4. Remove the cotter pin from the end of the halfshaft. Remove the nut lock, spring washer, axle nut and washer.
5. Remove the ball joint retaining bolt and pry the control arm down to release the ball stud from the steering knuckle.
6. Position a drainpan under the transaxle where the halfshaft enters the differential or extension housing. Remove the halfshaft from the transaxle or center bearing. Unbolt the center bearing from the block and remove the intermediate shaft from the transaxle, if equipped.

To install:

7. Install the halfshaft or intermediate shaft to the transaxle, being careful not to damage the side seals. Make sure the inner joint clicks into place inside the differential. Install the center bearing retaining bolts, if equipped. Install the outer shaft to the center bearing if equipped.
8. Pull the front strut out and insert the outer joint into the front hub.
9. Turn the ball joint stud, if necessary to position the bolt retaining in-

dent to the inside of the vehicle. Install the ball joint stud into the steering knuckle. Install the retaining bolt and nut.

10. Install the axle nut washer and nut and torque the nut to 180 ft. lbs. (244 Nm). Install the spring washer, nut lock and a new cotter pin.

11. Install the tire and wheel assembly.

Driveshaft and U-Joints

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.
2. Matchmark the driveshaft and the rear axle drive pinion gear shaft yoke. Unbolt the support collar from the frame, if equipped.
3. Remove the rear U-joint attaching bolts and both strap clamps from the rear axle drive pinion gear shaft yoke.
4. Fluid may run from the rear of the extension housing or transfer case when the shaft is removed, so position a suitable drain pan under the area.
5. Remove the driveshaft from the transmission or transfer case.
6. The installation is the reverse of the removal procedure. Torque the clamp bolts to 14 ft. lbs. (19 Nm) and the support collar bolts to 50 ft. lbs. (68 Nm).

Front Axle Shaft, Seal and Bearing

REMOVAL & INSTALLATION

Left Side Shaft

1. Raise the vehicle and support safely.
2. Disconnect the left CV driveshaft from the axle shaft flange.
3. Remove the differential housing cover. Rotate the differential case so that the differential pinion mate gear shaft lock screw is accessible. Remove the lock screw and the pinion mate gear shaft from the differential case.
4. Force the left axle shaft toward the center of the vehicle and remove the shaft C-clip lock from the recessed groove in the axle shaft.
5. Remove the axle shaft from the differential housing. Inspect the axle shaft bearing contact surface for brinelling, spalling and pitting. If any of these conditions exist, replace the axle shaft and bearing.
6. Remove the axle shaft seal from the end of the housing bore with a suitable pry bar. Remove the axle shaft bearing only if it is being re-

Left side axle shaft assembly

placed; do not reinstall used bearings. Use removal tool C-4167 and slide hammer tool C-637 to remove the bearing.

To install:

7. Thoroughly clean and dry the bearing bore in the differential housing.
8. Insert the new bearing into the pilot of bearing installation tool C-4198 and attach to the handle. Insert the bearing to the housing until it is seated against the bore shoulder.
9. Install the new seal using tool C-4203 with the flat side of the tool facing the seal. When the installation tool contacts the housing flange face, the seal is installed to the correct depth.
10. Lubricate the bearing bore and seal lip, insert the axle shaft into the housing and engage the splines. With the shaft in place, install the C-clip lock and push the shaft outward to seal the lock.
11. Install the mate shaft, align the hole in the shaft with the lock screw hole in the differential case and install the lock screw. Torque the lock screw to 8 ft. lbs. (11 Nm).
12. Thoroughly clean and dry the case cover, mating surface, bolts and bolt holes. Apply silicone sealer to the cover and install.
13. Connect the CV driveshaft.
14. Level the vehicle and fill the differential with multi-purpose gear lubricant.
15. Road test the vehicle and check for leaks and correct front axle operation.

Right Side and Intermediate Shaft

1. Raise the vehicle and support safely.
2. Remove the tire and wheel assembly.
3. Remove the cotter pin, nut lock and spring washer from the stub shaft. Remove the hub nut and washer.
4. Remove the bolts that attach the inner CV joint to the axle shaft flange.
5. Separate the stub shaft splines from the hub bearing splines and remove the CV joint shaft.
6. Remove the differential housing cover.

**Shift motor and related parts****Shift collar and related parts****Right side axle shaft assembly**

7. Disconnect the 4WD indicator lamp switch and the vacuum tube from the shift motor. Remove the shift motor, housing cover and gasket from the shift motor housing.

8. Remove the bearing seal/retainer attaching screws accessible via the holes in the axle shaft flange.

9. Remove the outer axle shaft from the differential housing.

10. Remove the snapring and the splined gear from the outer axle shaft. Separate the bearing and seal from the outer axle shaft.

11. Remove the shift collar from the shift motor housing.

12. Rotate the differential case so that the differential pinion mate gear shaft lock screw is accessible. Remove the lock screw and the pinion mate

gear shaft from the differential case.

13. Force the intermediate shaft toward the center of the vehicle and remove the shaft C-clip lock from the recessed groove in the axle shaft. Remove the intermediate shaft from the differential housing and tube.

To install:

14. Insert the axle shaft into the tube and housing and engage the splines. With the shaft in place, install the C-clip lock and push the shaft outward to seal the lock.

15. Install the mate shaft, align the hole in the shaft with the lock screw hole in the differential case and install the lock screw. Torque the lock screw to 8 ft. lbs. (11 Nm).

16. Install the shift collar to the intermediate shaft.

17. Install a new seal to the seal retainer and install to the outer shaft. Press on the new bearing, install the splined gear and the snapring.

18. Insert the outer axle shaft into the shift motor housing. Torque the attaching screws to 17 ft. lbs. (23 Nm).

19. Install the shift motor housing cover and gasket. Ensure that the shift fork is correctly engaged in the collar groove. Install the cover bolts. Connect the vacuum tubes to the shift motor and the connector to the 4WD lamp switch.

20. Thoroughly clean and dry the case cover, mating surface, bolts and bolt holes. Apply silicone sealer to the cover and install.

21. Lubricate the contact surface area of the CV driveshaft wear sleeve with grease and install the CV driveshaft. Torque the hub nut to 190 ft. lbs (258 Nm). Install the spring washer, nut lock and a new cotter pin.

21. Level the vehicle and fill the differential with multi-purpose gear lubricant.

22. Road test the vehicle and check for leaks and correct front axle operation.

Rear Axle Shaft, Bearing and Seal

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.

2. Remove the wheel and brake drum.

3. Remove the differential housing cover.

4. Rotate the differential case so that the differential pinion mate gear shaft lock screw is accessible. Remove the lock screw and the pinion mate gear shaft from the differential case.

5. Force the axle shaft toward the center of the vehicle and remove the

axle shaft C-clip lock from the recessed groove in the axle shaft.

6. Remove the axle shaft from the axle housing.

7. Pry the axle shaft seal from the end of the axle tube using a suitable pry bar.

8. To remove the bearing, use tool C-4167 attached to a suitable slide hammer.

To install:

9. Clean the bearing bore in the axle tube.

10. Insert the new axle shaft bearing onto the pilot of tool C-4198. The bearing is fully installed when it is seated firmly against the shoulder in the axle tube.

11. Install the new seal to the axle tube.

12. Lubricate the bearing bore and seal lip with grease and insert the axle shaft into the axle tube engaging its splines with the differential side gear splines.

13. Install the C-clip lock in the groove at the end of the shaft. Force the shaft outward to seat the C-clip.

14. Insert the differential pinion gear mate shaft into the case and through the thrust washers and pinion gears. Align the hole in the shaft with the lock screw hole in the differential case and install the lock screw. Torque the screw to 14 ft. lbs. (19 Nm).

15. Thoroughly clean and dry the case cover, mating surface, bolts and bolt holes. Apply silicone sealer to the cover and install.

16. Install the drum and wheel.

17. Fill the differential with the proper lubricant.

18. Road test the vehicle and check for leaks.

Front Wheel Hub, Knuckle and Bearings

REMOVAL & INSTALLATION

Caravan, Voyager and Town & Country

1. Raise the vehicle and support safely.

2. Remove the tire and wheel assembly. Remove the brake caliper from the adaptor and remove the adaptor. Remove the brake disc.

3. Remove the halfshaft.

4. Disconnect the tie rod from the knuckle.

5. Remove the 2 strut clamp bolts and remove the knuckle from the vehicle.

6. Attach the hub removal tool C-4811 or equivalent and the triangular adapter, to the 3 rear threaded holes of the steering knuckle housing with the thrust button inside the hub bore.

7. Tighten the bolt in the center of the tool, to press the hub from the steering knuckle. Remove the removal tools.

8. Remove the bolts and bearing retainer from the outside of the steering knuckle.

9. Carefully pry the bearing seal

from the machined recess of the steering knuckle and clean the recess.

10. Insert the tool C-4811 or equivalent, through the hub bearing and install bearing removal adapter to the outside of the steering knuckle. Tighten the tool to press the hub bearing from the steering knuckle. Discard the bearing and the seal.

To Install:

11. Use tool C-4811 or equivalent and the bearing installation adapter to press in the hub bearing into the steering knuckle.

12. Install a new seal, the bearing retainer and the bolts to the steering knuckle. Torque the bearing retainer bolts to 20 ft. lbs.

13. Use the tool C-4811 or equivalent and the hub installation adapter, to press the hub into the hub bearing.

14. Using the bearing installation tool C-4698 or equivalent, drive the new dust seal into the rear of the steering the hub and bearing from the knuckle as required.

15. The installation of the knuckle is the reverse of the removal procedure. Torque the tie rod nut to 35 ft. lbs. (47 Nm).

16. Align the front end.

Dakota with 2WD

1. Raise the vehicle and support safely.

2. Remove the tire and wheel assembly.

3. Remove the brake caliper and rotor with from the steering knuckle.

Front suspension components—Caravan, Voyager and Town & Country

4. Disconnect the tie rod end from the steering knuckle.
5. Disconnect both ball joints from the steering knuckle.
6. Remove the steering knuckle from the vehicle. Remove the splash shield and the steering arm from the knuckle.
7. The installation is the reverse of the removal procedure. Torque the steering arm to knuckle nuts to 217 ft. lb.s (294 Nm).

Dakota with 4WD

1. Raise the vehicle and support safely. Remove the tire and wheel assembly.
2. Remove the cotter pin, nut lock and spring washer from the end of the CV driveshaft. Remove the hub nut and washer.
3. Remove the brake caliper and the rotor from the hub.
4. Remove the bolts that attach the wheel hub to the steering knuckle.
5. Remove the wheel hub from the steering knuckle and the stub shaft.
6. Disconnect the tie rod end from the knuckle.
7. Remove the torsion bar. Remove the lower shock absorber attaching bolt.
8. Disconnect the stabilizer bar from the lower suspension arm.
9. Disconnect both ball joints from the steering knuckle.
10. Remove the steering knuckle from the vehicle and remove the bearing seal from the knuckle.

To install:

11. Install the wheel hub on the steering knuckle and torque the retaining bolts to 110 ft. lbs. (149 Nm)/.
12. Fill the cavity between the seal lip and the knuckle with multi-purpose lubricant. Position the new seal in the bore at the inner side of the knuckle and seat it with tool C-4698.
13. Lubricate the contact surface area of the CV driveshaft wear sleeve with grease and install the steering knuckle, engaging the splines of the CV driveshaft with those in the wheel hub. Torque the upper ball stud nut to 105 ft. lbs. (142 Nm) and the lower nut to 120 ft. lbs. (163 Nm).
14. Install the torsion bar.
15. Install the stabilizer bar and shock bolt.
16. Install the tie rod to the steering knuckle and torque the nut to 40 ft. lbs. (54 Nm).
17. Torque the hub nut to 190 ft. lbs (258 Nm). Install the spring washer, nut lock and a new cotter pin.
18. Install the tire and wheel assembly.
19. Set the front suspension height so that the difference between the distance from the surface that the tires

Front wheel hub removal and installation—Dakota with 4WD

- are on to the lower suspension arm inner pivot and the distance that the tires are on to the outer end of the arm is 1-1½ in.
20. Align the front end.
21. Road test the vehicle.

12. Refill the differential with the proper lubricant.
13. Road test the vehicle and check for leaks.

Pinion Seal

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.
2. Matchmark and remove the driveshaft.
3. Remove the rear wheel and brake drums to prevent any drag.
4. Using an inch lb. torque wrench, measure the pinion bearing preload. Read the torque while the handle of the wrench is moving through several complete revolutions.
5. Using the proper tools, hold the companion flange and remove the drive pinion nut and washer.
6. Remove the companion flange. Lower the rear of the vehicle to prevent fluid loss.
7. Using a seal remover tool, remove the seal from the carrier and clean the seal seat.

To install:

8. The outside diameter of the seal is precoated with a special sealer so no sealing compound is required for installing. The seal is properly installed when the flange contacts the housing flange face.
9. Install the companion flange and the washer with the convex side out.
10. Tighten the pinion nut to 210 ft. lbs. (285 Nm) and check the pinion bearing preload. If the preload is less than the original preload measured, continue tightening the nut in very small increments until the proper preload is reached.
11. Install the driveshaft, drums and rear wheels.

Differential Case

REMOVAL & INSTALLATION

Caravan, Voyager and Town & Country

NOTE: The differential case can be removed from some vehicles with the transaxle installed. To do so, remove the halfshafts, remove the 2 K-frame mounting nuts and 2 bolts and lower the K-frame to provide enough room to pull the differential case out of its housing and over the lowered frame.

1. Remove the right side extension housing.
2. Remove the differential cover.
3. Remove the bolts and remove the right side differential bearing retainer using tool L-4435, or equivalent.
4. Remove the differential case from the transaxle.
5. Use new seals and gasket material when assembling. The installation is the reverse of the removal procedure. Torque the extension housing and bearing retainer bolts to 21 ft. lbs. (28 Nm).

Dakota

1. Raise the vehicle and support safely.
2. Remove the wheels and the brake drums.
3. Remove the housing cover and drain the lubricant.
4. Remove the rear wheel anti-lock brake sensor, if equipped.
5. Remove both axle shafts.

6. Matchmark the bearing caps to the differential housing.

7. Remove the differential bearing threaded adjuster lock from each cap.

8. Loosen but do not remove the bearing caps.

9. Loosen the side adjusters using tool C-4164.

10. Remove the bearing caps, the threaded adjusters and the differential case.

To install:

11. Position the assembled differential case in the housing.

12. Install the bearing caps in their original positions according to the matchmarks made during the disassembly.

13. Torque the upper bolts to 10 ft. lbs. (14 Nm) and finger tighten the bottom bolts.

14. Tighten the side adjusters until the proper side play specifications are reached.

15. Torque the bearing caps bolts to 45 ft. lbs. (61 Nm) for 7¼ in. rear or 100 ft. lbs. (136 Nm) for 8¼ in. rears.

16. Install both axle shafts.

17. Install the rear wheel anti-lock brake sensor, if equipped.

18. Install the housing cover and fill with the proper lubricant.

19. Install the drums and wheels.

20. Road test the vehicle.

Axle Housing

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Raise vehicle and support safely.

2. Remove the rear wheel anti-lock brake sensor, if equipped.

3. Remove the rear wheels.

4. Disconnect the brake hose at the T-fitting.

5. Disconnect the parking brake cables.

6. Remove the driveshaft.

7. Support the weight of the assembly with the proper equipment. Disconnect the shock absorbers and remove the leaf spring nuts and U-bolts.

8. Remove the assembly from vehicle.

9. The installation is the reverse of the removal procedure.

STEERING

Steering Wheel

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the horn pad.

3. Remove the steering wheel hold-down nut. Matchmark the steering wheel to the shaft.

4. Using a suitable steering wheel puller, pull the steering wheel off of the shaft.

5. The installation is the reverse of the removal procedure.

Manual Rack and Pinion Steering Gear

REMOVAL & INSTALLATION

Caravan and Voyager

1. Disconnect the negative battery cable.

2. Raise the vehicle and support safely. Remove the front wheel assemblies.

3. Remove the cotter pins, castle nuts and tie rod ends from the steering knuckles.

4. Remove the steering column to steering gear coupling pin.

5. If equipped, remove the the air diverter valve bracket, from the left side of the crossmember. The lower universal joint is removed with the steering gear.

6. Remove the front suspension crossmember attaching bolts and nuts.

7. Lower the crossmember.

8. Remove the axle boot shield, if equipped.

9. Remove the boot shields.

10. Remove the steering gear bolts from the front suspension crossmember.

11. Remove the steering gear from the left side of the vehicle.

12. The installation is the reverse of the removal procedure. The right rear crossmember bolt is a pilot bolt that correctly locates the crossmember, tighten it first. Torque the crossmember bolts to 90 ft. lbs. and the steering gear attaching bolts to 21 ft. lbs.

Dakota with 2WD

1. Disconnect the negative battery cable.

2. Remove the tie rod ends from the steering knuckle.

3. Remove the coupling pin.

4. Remove the bolts attaching the rack to the crossmember.

5. Remove the gear from the vehicle.

6. The installation is the reverse of the removal procedure. Torque the mounting bolts to 150 ft. lbs. (203 Nm).

Power Rack and Pinion Steering Gear

REMOVAL & INSTALLATION

Caravan, Voyager and Town & Country

1. Disconnect the negative battery cable.

2. Raise the vehicle and support safely. Remove front wheel assemblies.

3. Remove the cotter pins, castle nuts and tie rod ends from the steering knuckles.

4. Remove the steering column to steering gear coupling pin. If equipped, remove the anti-rotational link from the crossmember and the air diverter valve bracket, from the left side of the crossmember. The lower universal joint is removed with the steering gear.

5. Disconnect and plug the oil lines from the rack, if equipped.

6. Remove the front suspension crossmember attaching bolts and nuts.

7. Lower the crossmember.

8. Remove the axle boot shield, if equipped.

9. Remove the boot shields.

10. Remove the steering gear bolts from the front suspension crossmember.

11. Remove the steering gear from the left side of the vehicle.

12. The installation is the reverse of the removal procedure. The right rear crossmember bolt is a pilot bolt that correctly locates the crossmember, tighten it first. Torque the crossmember bolts to 90 ft. lbs. and the steering gear attaching bolts to 21 ft. lbs. Refill the power steering pump.

Dakota with 2WD

1. Disconnect the negative battery cable.

2. Remove the tie rod ends from the steering knuckle.

3. Disconnect and plug the power steering fluid lines.

3. Remove the coupling pin.

4. Remove the bolts attaching the rack to the crossmember.

5. Remove the gear from the vehicle.

6. The installation is the reverse of the removal procedure. Torque the mounting bolts to 150 ft. lbs. (203 Nm).

7. Refill the power steering pump.

Power Steering Gear

REMOVAL & INSTALLATION

Dakota with 4WD

1. Disconnect the negative battery cable.

Rack and pinion steering gear mounting—Caravan, Voyager and Town & Country

Rack and pinion steering gear mounting—Dakota

2. Raise the vehicle and support safely. Center the steering.

3. Disconnect the pitman arm from the center link.

4. Disconnect and plug the pressure and return hoses.

5. Disconnect the steering gear to shaft coupling.

6. Remove the steering gear mount bolts and remove the gear from the vehicle.

7. Matchmark and remove the pitman arm from the sector shaft.

8. The installation is the reverse of the removal procedure. Torque the pitman arm nut to 175 ft. lbs. (237 Nm) and the mount bolts to 100 ft. lbs. (136 Nm).

9. Refill the power steering pump.

ADJUSTMENT

1. If the vehicle wanders of the

steering has too much play, the sector shaft can be adjusted.

2. Loosen the adjusting screw locknut and turn the screw all the down.

3. Back the screw off $\frac{1}{4}$ – $\frac{1}{2}$ turn.

4. Tighten the locknut.

5. Road test the vehicle. If the steering wheel does not return easily after a turn, back the screw off until the wheel returns easily.

Power Steering Pump

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Position a drain pan under the power steering pump.

3. Disconnect the fluid hoses from the pump and plug them.

4. Remove the front bracket attach-

ing bolts and remove the belt from the pulley.

5. Remove the rear pump to bracket nut and remove the pump.

6. Remove the bracket from the pump.

7. Remove the pulley from the pump with the proper puller. Install the pulley on the new pump using the special installation tools.

8. The installation is the reverse of the removal procedure.

BELT ADJUSTMENT

NOTE: The belt tension is automatically adjusted by a dynamic tensioner on the 3.0L and 3.3L engines. Adjustment is not possible.

1. Loosen the bracket mounting bolts.

2. Using a $\frac{1}{2}$ in. drive breaker bar in the square hole provided in the bracket, move the pump away from the engine. Do not pry against the fluid reservoir.

3. With the pump moved enough so that the belt deflects about $\frac{1}{4}$ – $\frac{1}{2}$ in. under a 10 lb. load, tighten the bolts.

SYSTEM BLEEDING

1. Fill the reservoir with power steering fluid.

2. Turn the wheels to the full left turn position and add fluid until the reservoir is full.

3. Start the engine and add fluid to bring the level to the correct level.

4. To purge the system of air, turn the steering wheel from side to side without contacting the stops.

5. Return the wheel to the straight ahead position and operate the engine for 2 minutes before road testing. This should bleed the system completely.

Tie Rod Ends

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.

2. Remove the cotter pin and nut from the tie rod end.

3. Using a suitable puller, remove the tie rod from the steering knuckle or center link, if equipped.

4. Loosen the sleeve clamp nut and bolt, if equipped and unscrew the tie rod end from the sleeve or inner tie rod.

5. The installation is the reverse of the removal procedure. Torque the stud nuts to 45 ft. lbs. (61 Nm) and install a new cotter pin.

6. Perform a front end alignment as required.

BRAKES

For all brake system repair and service procedure not detained below, please refer to "Brakes" in the Unit Repair section.

Master Cylinder

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Disconnect and plug the brake lines from the master cylinder.
3. Remove the nuts attaching the master cylinder to the power booster.
4. Remove the master cylinder from the mounting studs.
5. Remove the fluid reservoir from the cylinder.

To install:

6. Bench bleed the master cylinder.
7. Install to the studs and install the nuts.
8. Install the brake lines to the master cylinder.

Combination Valve

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Raise the vehicle and support safely.
3. Tag and disconnect the brake lines from the valve.
4. Disconnect the wires to the pressure switch.
5. Remove the combination valve from the frame bracket.
6. The installation is the reverse of the removal procedure.
7. Bleed the brakes in the following order:
 - a. Rear wheel anti-lock valve, if equipped
 - b. Right rear wheel cylinder
 - c. Left rear wheel cylinder
 - d. Right front caliper
 - e. Left front caliper

Height Sensing Proportioning Valve Assembly

REMOVAL & INSTALLATION

Caravan, Voyager and Town & Country

1. Remove the snow/stone shield.
2. Remove the actuator assembly.
3. Tag and disconnect the brake lines from the valve.

4. Remove the valve from the frame bracket.

5. The installation is the reverse of the removal procedure.

ADJUSTMENT

1. With the vehicle lifted so that the rear suspension is hanging free, disconnect the shock absorbers.
2. Remove the rear tire and wheel assemblies and loosen both front spring hanger pivot bolts.
3. Make sure the actuator hook is properly seated on the valve lever. Loosen the adjustment nut on the actuator assembly.
4. Pull the actuator assembly toward the spring hanger until the valve lever bottoms on the valve body and hold the position.
5. Tighten the adjustment nut to 25 inch lbs. This will complete the adjustment.
6. Tighten the spring bolts, install the shocks and wheels and road test the vehicle.

Power Brake Booster

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Disconnect the vacuum hose(s) from the booster.
2. Remove the nuts attaching the master cylinder to the booster and move the master cylinder to the side.
3. From inside of the vehicle, remove the clip that secures the booster pushrod to the brake pedal.
4. Remove the nuts that attach the booster to the dash panel and remove it from the vehicle.
5. Transfer the check valve to the new booster.

6. The installation is the reverse of the removal procedure.

Brake Caliper

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.
 2. Remove the tire and wheel assembly. Remove the hold-down spring on Dakota.
 3. Remove the caliper mounting pin(s).
 4. Lift the caliper off of the rotor. Remove the outer pad from the caliper.
 5. Remove the brake hose retaining bolt from the caliper.
- To install:**
6. Install the brake hose to the caliper using new copper washers.
 7. Position the caliper over the rotor so the caliper engages the adaptor correctly. Install the mounting pin(s). Install the hold-down spring, if equipped.
 8. Fill the master cylinder and bleed the brakes.

Combination switch - Dakota

Height sensing proportioning valve - Caravan, Voyager and Town & Country

Disc Brake Pads

REMOVAL & INSTALLATION

1. Remove some of the fluid from the master cylinder.

2. Raise the vehicle and support safely. Remove the tire and wheel assemblies.

3. Remove the hold-down spring on Dakota. Remove the caliper and remove the outer pad from the caliper.

4. Remove the inner pad from the adaptor.

To install:

5. Use a large C-clamp to compress the piston back into the caliper bore.

6. Install the inner pad to the adaptor.

7. Position the caliper over the rotor so the caliper engages the adaptor correctly and install the retainer pin(s).

8. Install the hold-down spring, if equipped.

9. Refill the master cylinder.

2. Remove the caliper and brake pads.

3. Remove the factory installed clips, if equipped. It is not necessary to reinstall these clips.

4. Remove the rotor from the hub.

5. The installation is the reverse of the removal procedure.

Brake Rotor

REMOVAL & INSTALLATION

Caravan, Voyager and Town & Country

1. Raise the vehicle and support safely. Remove the tire and wheel assembly.

Dakota

1. Raise the vehicle and support safely.

2. Remove the wheel and tire assembly.

3. Remove the caliper and disc brake pads.

4. Remove the dust cap.

5. Remove the cotter pin, nut lock, wheel bearing nut and washer from the spindle.

6. Remove the outer wheel bearing.

7. Remove the rotor with the inner wheel bearing from the spindle. Remove the grease seal.

To install:

8. Lubricate and install the inner wheel bearing. Install a new grease seal.

9. Install the rotor to the spindle.

10. Lubricate and install the outer wheel bearing, washer and nut. When the bearing preload is properly set, install the nut lock and a new cotter pin.

11. Install the grease cap.

12. Install the brake pads and caliper.

13. Install the wheel and tire assembly.

Kelsey-Hayes front disc brake caliper, pads and related parts—1986-88 Caravan and Voyager

ATE front disc brake caliper, pads and related parts—1988-90 Caravan, Voyager and Town & Country

Kelsey-Hayes front disc brake caliper, pads and related parts—Dakota

Brake Drums

REMOVAL & INSTALLATION

Caravan, Voyager and Town & Country

1. Raise the vehicle and support safely.
2. Remove the wheel and tire assembly.
3. Remove the dust cap.
4. Remove the cotter pin and nut lock.
5. Remove the wheel bearing nut and washer from the spindle.
6. Remove the outer wheel bearing.
7. Remove the drum with the inner wheel bearing from the spindle. If the drum is difficult to remove, remove the plug from the rear of the backing plate and push the self adjuster lever away from the star wheel. Rotate the star wheel to retract the shoes. Remove the grease seal.

To install:

8. Lubricate and install the inner wheel bearing. Install a new grease seal.
9. Install the drum to the spindle.
10. Lubricate and install the outer wheel bearing, washer and nut. When the bearing preload is properly set, install the nut lock and a new cotter pin.
11. Install the grease cap.
12. Install the wheel and tire assembly. Adjust the rear brakes as required.

Dakota

1. Raise the vehicle and support safely.
2. Remove the wheel.
3. Remove the factory clips from the wheel studs, if equipped. It is not necessary to reinstall these clips.
4. Remove the drum. If the drum is difficult to remove, remove the plug from the rear of the backing plate and push the self adjuster lever away from the star wheel. Rotate the star wheel to retract the shoes.
5. The installation is the reverse of the removal procedure.
6. Adjust the rear brakes as required.

Brake Shoes

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely. Remove the wheel and tire assemblies and the drums.
2. Remove the primary and secondary shoe return springs from the anchor pin.
3. Lift the adjuster lever and disconnect the actuator cable.
4. Remove the shoe retainers and springs.
5. Remove the shoes (held together by the lower spring) while separating the parking brake actuating lever from the shoe with a twisting motion.

To install:

6. Thoroughly clean and dry the backing plate. To prepare the backing plate, lubricate the bosses, anchor pin and parking brake actuating lever pivot surface lightly with lithium based grease.
7. Remove, clean and dry all parts

still on the old shoes. Lubricate the star wheel shaft threads with anti-sieze lubricant and transfer all parts to their proper locations on the new shoes.

8. Spread the shoes apart, engage the parking brake lever and position them on the backing plate so the wheel cylinder pins engage and the anchor pins hold the shoes.

9. Install the parking brake strut and hold-down spring assemblies. Install the anchor plate. Lubricate the sliding surface of the actuator cable plate lightly and install the cable.

10. Install the shoe return spring opposite the cable, then install the remaining cable.

11. Adjust the star wheel.

12. Remove any grease from the linings and install the drum.

13. Complete the brake adjustment with the wheels installed.

Wheel Cylinder

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.
2. Remove the wheel, drum and brake shoes.
3. Remove the brake line from the wheel cylinder.
4. Remove the wheel cylinder bolts and remove the cylinder from the backing plate.

To install:

5. Apply a very thin coating of silicone sealer to the cylinder mounting surface, install the cylinder to the

Typical rear brake shoe assembly

backing plate and install the retaining bolts.

6. Connect the brake line to the wheel cylinder.

7. Install all brake parts that were removed.

8. Install the tire and wheel assembly.

9. Bleed the brakes.

Front Parking Brake Cable

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.

2. Remove the front cable adjusting nut.

3. Remove the clip securing the cable to the anchor bracket, if equipped and slide the cable out of the bracket.

4. Remove the retainer attaching the cable to the pedal assembly frame. Disengage the cable from the pedal clevis.

5. Remove the cable grommet from the floor pan and remove the cable.

6. The installation is the reverse of the removal procedure.

Intermediate Parking Brake Cable

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.

2. Loosen the parking brake adjuster nut enough so the cable is slack.

3. Disengage the adjuster hook from the frame rail.

4. Disengage the intermediate cable from the connectors and the right side cable guide.

5. Remove the cable.

6. The installation is the reverse of the removal procedure.

Rear Parking Brake Cable

REMOVAL & INSTALLATION

1. Release the parking brakes fully.

2. Raise the vehicle and support safely.

3. Remove the adjusting nut from the front cable.

4. Remove the brake drums. Remove the shoes, if necessary. Disconnect the cable from the lever and compress the cable retainer tabs and remove the cable from the backing plate.

5. Remove the cable from the guides and connectors or equalizer and remove the retaining clips from the frame bracket.

6. The installation is the reverse of the removal procedure.

ADJUSTMENT

1. Release the parking brakes fully.

2. Raise the vehicle and support safely.

3. Adjust the rear brakes.

4. Loosen the nut on the front cable until there is slack in all the cables.

5. Rotate the rear wheels and tighten the cable adjusting nut until there is a slight drag at the wheels.

6. Continue to rotate the rear wheels and loosen the nut until all drag is eliminated.

7. Back off the nut an additional 2 turns.

8. Apply and release the parking brake several times. Upon the least release, verify that there is no drag at the wheels.

9. To check the operation, make sure the parking brake holds on an incline.

FRONT SUSPENSION

Shock Absorbers

REMOVAL & INSTALLATION

1. Support the vehicle safely and raise enough to so there is room to get to the upper shock mount.

2. Remove the upper shock nut, washer and bushing. Raise the vehicle fully.

3. Remove the lower mounting bolts and remove the shock from the vehicle.

4. The installation is the reverse of the removal procedure.

MacPherson Strut

REMOVAL & INSTALLATION

1. Remove the 3 mounting nuts from the shock tower under the hood.

2. Raise the vehicle and support safely.

3. Remove the brake hose bracket screw from the strut.

4. Remove the strut to knuckle bolts, nuts and nut washer.

5. The installation is the reverse of the removal procedure. Torque the upper mounting nuts to 20 ft. lbs. (27 Nm).

6. Perform a front end alignment. Torque the strut to knuckle nuts to 75 ft. lbs. (100 Nm) plus 1/4 turn.

Coil Spring

REMOVAL & INSTALLATION

Caravan, Voyager and Town & Country

1. Raise the vehicle and support

MacPherson strut assembly

safely. Remove the MacPherson strut from the vehicle.

2. Compress the coil spring using tool C-4838, or a suitable MacPherson spring compressor.

3. Remove the upper assembly retaining nut.

4. Remove the damper assembly and plastic strut tube, if equipped.

To install:

5. Install the compressed spring to the strut, making sure the spring end is seated in the recess.

6. Install the damper assembly to the strut rod.

7. Align the alignment notch or tab with the lower bracket.

8. Tighten the upper assembly retaining nut to 60 ft. lbs. (81 Nm). Make sure the spring and damper assembly are still aligned before releasing the compressor tool.

9. Release the compressor tool.

10. Install the strut to the vehicle.

11. Perform a front end alignment.

Dakota with 2WD

1. Raise the vehicle and support safely.

2. Remove the shock absorber.

3. Disconnect the sway bar from the lower control arm, if equipped.

4. Install spring compressor tool DD-1278, or equivalent to the coil spring and tighten the nut finger tight, then back off half a turn.

5. Remove the cotter pin and lower ball joint nut.

6. Release the lower ball joint taper using ball stud loosening tool C-3564-A, or equivalent.

7. Remove the tool and remove the ball stud from the control arm. Re-

Installing and aligning the damper assembly— 1986 Caravan and Voyager

Installing and aligning the damper assembly— 1987-90 Caravan, Voyager and Town & Country

Front Suspension—Dakota with 2WD

lease the compressor tool from the coil spring.

8. Pull the arm down and remove the spring with the rubber isolation pad from the vehicle.

To install:

9. Install the spring with the rubber isolator. Install the compressor tool and compress it enough so the lower ball joint can be inserted through the knuckle.

10. Torque the lower ball joint nut to 135 ft. lbs. (183 Nm). Install a new cotter pin. Remove the spring compressor.

11. Connect the sway bar to the lower control arm, if equipped.

12. Install the shock absorber.

Torsion Bar

REMOVAL & INSTALLATION

Dakota with 4WD

NOTE: The left and right side torsion bars are not interchangeable. The bars are identified by the letter R or L stamped into one end of the bar. The bars do not have a front or rear, though and can be installed with either end facing forward.

1. Remove the upper control arm jounce bumper.

2. Raise the vehicle with the front suspension hanging free and support safely.

Torsion Bar assembly—Dakota with 4WD

3. Release the load from the torsion bar by turning the adjustment bolt counterclockwise.

4. Remove the adjustment bolt from the swivel and then remove the torsion bar and the anchor together from the vehicle. Remove the torsion bar from the anchor.

5. Remove any dirt, rust or pebbles from the hex shaped socket in the anchor and lower control arm.

6. Inspect the anchor and bolt and replace them if any damage or corrosion exists.

To install:

7. Insert the torsion bar ends into the sockets.

8. Position the anchor and the bushing in the crossmember, insert the adjustment bolt and thread it into the swivel.

9. Turn the adjustment bolt clockwise to apply a load on the bar.

10. Lower the vehicle.

11. Set the front suspension height so that the difference between the distance from the surface that the tires are on to the lower control arm inner pivot and the distance that the tires are on to the outer end of the arm is 1-1½ in.

12. Install the upper control arm jounce bumper.

Upper Ball Joint

INSPECTION

To inspect the ball joints, unload the suspension. Upper ball joints on 2WD vehicles and any ball joint on 4WD vehicles should be replaced if any play exists at all.

REMOVAL & INSTALLATION

Dakota with 2WD

1. Raise the vehicle and support safely.

2. Position a support at the outer end of the lower control arm and lower the vehicle so that the support compresses the coil spring.

3. Remove the tire and wheel assembly.

4. Release the upper ball joint taper using ball stud loosening tool C-3564-A, or equivalent.

5. Unthread the ball joint from the control arm with tool C-3561, or equivalent.

6. Torque the ball joint itself to 125 ft. lbs. (169 Nm).

7. Torque the upper ball stud nut to 135 ft. lbs. (183 Nm) and install a new cotter pin.

8. The installation is the reverse of the removal procedure.

Dakota with 4WD

1. Raise the vehicle and support safely.

2. Remove the CV driveshaft from the vehicle.

3. Turn the torsion bar adjustment nut counterclockwise to relieve all tension from the torsion bar.

4. Remove the cotter pin from the upper ball stud.

5. Release the upper ball joint taper using ball stud loosening tool C-3564-A, or equivalent. Remove the tool.

6. Remove the upper ball stud seal.

7. Force the ball joint from the arm using the ball stud removal and installation tool C-4212.

To install:

8. Install the new ball joint using the ball stud removal and installation tool C-4212.

9. Install the ball stud seal.

10. Insert the upper ball stud in the steering knuckle arm bore and install the nut. Torque the nut to 105 ft. lbs. (142 Nm) and install a new cotter pin.

11. Turn the torsion bar adjustment nut clockwise to apply a load on the bar.

12. Install the CV driveshaft and all related parts.

13. Lower the vehicle.

14. Set the front suspension height so that the difference between the distance from the surface that the tires are on to the lower control arm inner pivot and the distance that the tires are on to the outer end of the arm is 1-1½ in.

Lower Ball Joint

INSPECTION

To inspect the ball joints on Caravan, Voyager and Town & Country, grasp the grease fitting by hand with the vehicle on the ground. If the grease fitting can be moved at all by hand, the ball joint should be replaced.

To inspect the lower ball joints on Dakota, unload the suspension. Lower ball joints on 2WD vehicles should be replaced if they have more than 0.020 in. play. Any ball joint on 4WD vehicles should be replaced if any play exists.

REMOVAL & INSTALLATION

Caravan, Voyager and Town & Country

On Caravan, Voyager and Town & Country, the ball joints are welded to the lower control arms. This necessitates replacement of the control arm assembly. Do not attempt to replace ball joints that are welded to the control arm; replacement control arms are equipped with a new ball joint.

Dakota with 2WD

1. Raise the vehicle and support safely.

2. Remove the shock absorber.

3. Disconnect the sway bar from the lower control arm, if equipped.

4. Install spring compressor tool DD-1278, or equivalent to the coil spring and tighten the nut finger tight, then back off half a turn.

5. Remove the cotter pin and lower ball joint nut.

6. Release the lower ball joint taper using ball stud loosening tool C-3564-A, or equivalent.

7. Remove the tool and remove the ball stud from the control arm. Release the compressor tool from the coil spring.

8. Pull the arm down and remove the spring with the rubber isolation pad from the vehicle. Remove the ball joint boot. Use tool C-4212, or an appropriate ball joint press to remove the ball joint from the arm.

To install:

9. Use the remover tool to press the ball joint into the arm. Install a new rubber boot. Install the spring with the rubber isolators. Install the compressor tool and compress it enough so the lower ball joint can be inserted through the knuckle.

10. Torque the lower ball joint nut to 135 ft. lbs. (183 Nm). Install a new cotter pin. Remove the spring compressor.

11. Connect the sway bar to the lower control arm, if equipped.

12. Install the shock absorber.

Dakota with 4WD

1. Raise the vehicle and support safely.

2. Remove the CV driveshaft.

3. Remove the torsion bar.

4. Remove the shock absorber lower attaching bolt.

5. Disconnect the stabilizer bar from the lower control arm.

6. Remove the cotter pin and the nut from the lower ball stud. Separate the lower ball stud from the steering knuckle.

7. Pry the peened ball joint retainer sections upward from the lower control arm and remove the ball joint from the arm.

To install:

8. Install the new ball joint in the control arm. Peen the ball joint housing retainer over to secure the ball joint.

9. Install the grease seal.

10. Insert the ball stud into the steering knuckle bore. Install the nut, torque to 120 ft. lbs. (163 Nm) and install a new cotter pin.

11. Attach the stabilizer bar to the control arm and install the shock mount bolt.

12. Install the torsion bar and turn the adjustment bolt clockwise to apply a load to the bar.

13. Install the CV driveshaft and all related parts.

14. Lower the vehicle.

15. Set the front suspension height so that the difference between the distance from the surface that the tires are on to the lower control arm inner pivot and the distance that the tires are on to the outer end of the arm is 1-1/2 in.

16. Perform a front end alignment.

Front Suspension—Dakota with 4WD

Upper control arm—Dakota with 2WD

Upper Control Arm REMOVAL & INSTALLATION

Dakota with 2WD

1. Raise the vehicle and support safely.

2. Remove the shock absorber.

3. Disconnect the sway bar from the lower control arm, if equipped.

4. Install spring compressor tool DD-1278, or equivalent to the coil spring and tighten the nut finger tight, then back off half a turn.

5. Remove the cotter pin and upper ball joint nut. Suspend the rotor assembly with a wire so there is not excessive pull on the brake hose.

6. Release the upper ball joint taper using ball stud loosening tool C-3564-A, or equivalent.

7. Remove the tool and remove the ball stud from the control arm.

8. Remove the pivot bar retaining bolts and remove the arm from the vehicle.

To install:

9. Install the arm to the frame rail bracket and install the retaining bolts.

10. Torque the ball joint nut to 135 ft. lbs. (183 Nm). Install a new cotter pin. Remove the spring compressor.

11. Connect the sway bar from the lower control arm, if equipped.

12. Install the shock absorber.

13. Align the front end. When all settings are at specifications, torque the pivot bar retaining bolts to 155 ft. lbs. (210 Nm).

Dakota with 4WD

1. Raise the vehicle and support safely.

2. Remove the CV driveshaft from the vehicle.

3. Turn the torsion bar adjustment nut counterclockwise to relieve all tension from the torsion bar. Remove the screws that attach the brake hose bracket to the upper arm. Remove the shock absorber.

4. Remove the cotter pin from the upper ball stud.

5. Release the upper ball joint taper using ball stud loosening tool C-3564-A, or equivalent. Remove the tool. Remove the ball stud from the steering knuckle.

6. Remove the pivot bar retaining bolts.

7. Remove the arm from the vehicle.

To install:

8. Position the arm at the frame rail bracket.

9. Install the pivot arm nuts and bolts.

10. Insert the upper ball stud in the steering knuckle arm bore and install the nut. Torque the nut to 105 ft. lbs. (142 Nm) and install a new cotter pin. Install the shock absorber and attach the brake hose bracket.

11. Turn the torsion bar adjustment nut clockwise to apply a load on the bar.

12. Install the CV driveshaft and all related parts.

13. Lower the vehicle.

14. Set the front suspension height so that the difference between the distance from the surface that the tires are on to the lower control arm inner pivot and the distance that the tires are on to the outer end of the arm is 1-1/2 in.

Lower Control Arm

REMOVAL & INSTALLATION

Caravan, Voyager and Town & Country

1. Raise the vehicle and support safely. Remove the tire and wheel assembly.

2. Remove the sway bar.

3. Remove the ball joint stud retaining bolt and nut.

4. Pry the lower control arm from the steering knuckle.

5. Remove the control arm to cross-member bolts, nuts bushings and retainers.

6. Remove the control arm from the vehicle.

7. Transfer all reusable parts to the new control arm and lubricate.

8. The installation is the reverse of the removal procedure. Torque the front pivot bolt to 120 ft. lbs. (163 Nm) and the rear mounting nut to 70 ft. lbs. (95 Nm).

9. Perform a front end alignment as required.

Dakota with 2WD

1. Raise the vehicle and support safely.

2. Remove the shock absorber.

3. Disconnect the sway bar from the lower control arm, if equipped.

4. Install spring compressor tool DD-1278, or equivalent to the coil spring and tighten the nut finger tight, then back off half a turn.

5. Remove the cotter pin and lower ball joint nut.

6. Release the lower ball joint taper using ball stud loosening tool C-3564-A, or equivalent.

7. Remove the tool and remove the ball stud from the control arm. Release the compressor tool from the coil spring.

8. Pull the arm down and remove the spring with the rubber isolation pad from the vehicle. Remove the lower control arm pivot bolts from the crossmember and remove the arm from the vehicle.

To install:

9. Install the arm to the crossmember finger tight. Install the spring with the rubber isolators. Install the compressor tool and compress it enough so the lower ball joint can be inserted through the knuckle.

10. Torque the lower ball joint nut to 135 ft. lbs. (183 Nm). Install a new cotter pin. Remove the spring compressor.

11. Connect the sway bar from the lower control arm, if equipped.

12. Install the shock absorber.

13. Lower the vehicle completely. When the weight of the vehicle is off of the lifting apparatus, torque the front lower arm pivot bolt to 130 ft. lbs. (176 Nm) and the rear nut to 80 ft. lbs. (108 Nm).

14. Align the front end as required.

Dakota with 4WD

1. Raise the vehicle and support safely.

2. Remove the CV driveshaft.

3. Remove the torsion bar.

4. Remove the shock absorber lower attaching bolt.

5. Disconnect the stabilizer bar from the lower control arm.

6. Remove the cotter pin and the nut from the lower ball stud. Separate the lower ball stud from the steering knuckle.

7. Remove the pivot bolts and remove the arm from the vehicle.

To install:

8. Install the new control arm to the vehicle.

9. Install the pivot bolts.

10. Insert the ball stud into the steering knuckle bore. Install the nut, torque to 120 ft. lbs. (163 Nm) and install a new cotter pin.

11. Attach the stabilizer bar to the control arm and install the shock mount bolt.

12. Install the torsion bar and turn the adjustment bolt clockwise to apply a load to the bar.

13. Install the CV driveshaft and all related parts.

14. Lower the vehicle so the weight of the vehicle is completely off of the lifting apparatus.

15. Torque the front pivot nut to 80 ft. lbs. (108 Nm) and the rear nut to 130 ft. lbs. (176 Nm).

16. Set the front suspension height so that the difference between the distance from the surface that the tires are on to the lower control arm inner pivot and the distance that the tires are on to the outer end of the arm is 1-1/2 in.

17. Perform a front end alignment.

Sway Bar

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.

2. Remove the front sway bar brackets and retainers.

3. Remove the sway bar support brackets and bushings from the lower control arm. Remove the sway bar from the vehicle.

4. The installation is the reverse of the removal procedure.

Front Wheel Bearings

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.

2. Remove the tire and wheel assembly.

3. Remove the caliper and disc brake pads.

4. Remove the dust cap.

5. Remove the cotter pin, castellated nut lock, wheel bearing nut and washer from the spindle.

6. Remove the outer wheel bearing.

7. Remove the rotor with the inner wheel bearing from the spindle. Remove the grease seal.

To install:

8. Lubricate and install the inner wheel bearing. Install a new grease seal.

9. Install the rotor to the spindle.

10. Lubricate and install the outer wheel bearing, washer and nut. When the bearing preload is properly set, install the nut lock and a new cotter pin.

11. Install the grease cap.

12. Install the brake pads and caliper.

13. Install the wheel.

ADJUSTMENT

1. Tighten the wheel bearing nut to 20–25 ft. lbs. (27–34 Nm) while turning the rotor.
2. Loosen the wheel bearing adjusting nut completely.
3. Tighten the nut finger tight.
4. Check the wheel bearing endplay. The specification is 0.0001–0.003 in.
5. Install the nut lock and cotter pin.

REAR SUSPENSION

Shock Absorber

REMOVAL & INSTALLATION

1. Raise the vehicle and support safely.
2. Remove the bolts that attach the shock to the frame or bracket.
3. Remove the shock from the vehicle.
4. The installation is the reverse of the removal procedure.

Leaf Springs

REMOVAL & INSTALLATION

Caravan, Voyager and Town & Country

1. Raise the vehicle and support safely.
2. Disconnect the actuator valve for the height sensing proportional valve.
3. Disconnect the shock absorbers from the axle brackets.
4. Remove the U-bolt nuts and washers and remove the U-bolts.
5. Lower the rear axle assembly allowing the spring to hang free.

6. Remove the bolts from the front hanger.

7. Remove the rear spring shackle nuts and plate and remove the shackle from the spring.

8. Remove the front pivot bolt from the front spring hanger and remove the springs from the vehicle.

To install:

9. Assemble the shackle bushings and plate on the rear of the spring and rear spring hanger and start the shackle bolts.

10. Assemble the front spring hanger to the front of the spring eye and install the pivot bolt and nut. The pivot bolt must face inboard to prevent structural damage during installation.

11. Raise the front of the spring to the vehicle and install the 4 hanger bolts and torque to 45 ft. lbs. (61 Nm). Connect the actuator assembly for the height sensing proportioning valve.

12. Raise the axle assembly to the correct position with the axle centered under the spring center bolt.

13. Install the U-bolts, washers and nuts and torque the nuts to 60 ft. lbs. (81 Nm).

14. Install the shock absorbers.

15. Lower the vehicle so the full weight of the vehicle is off of the lifting apparatus.

16. Torque the front pivot bolts to 105 ft. lbs. (142 Nm).

17. Torque the shackle nuts to 35 ft. lbs. (47 Nm).

18. Adjust the height sensing proportioning valve.

Dakota

1. Raise the vehicle and support safely.

2. Using the proper equipment, support the weight of the axle.

3. Remove the nuts, washers and U-bolts attaching the springs to the axle housing. Remove the spacer.

4. Remove the spring shackle bolts, shackle and spring front bolt.

5. Remove the springs and auxiliary spring, if equipped, from the vehicle.

6. The installation is the reverse of the removal procedure.

Rear Wheel Bearings

REMOVAL & INSTALLATION

Caravan, Voyager and Town & Country

1. Raise the vehicle and support safely.
2. Remove the tire and wheel assembly.
3. Remove the dust cap.
4. Remove the cotter pin, nut lock and nut.
5. Remove the thrust washer and the outer wheel bearing.
6. Remove the drum with the inner wheel bearing and the grease seal.
7. Remove the grease seal and remove the inner bearing.

To install:

8. Lubricate the inner bearing and install to the drum.
9. Install a new grease seal.
10. Install the drum to the vehicle.
11. Lubricate and install the outer wheel bearing to the spindle.
12. Install the thrust washer.
13. Install and tighten the wheel bearing nut to 20–25 ft. lbs. (27–34 Nm) while rotating the drum.
14. Back off the adjusting nut ¼ turn then tighten it finger tight.
15. Install the nut lock and a new cotter pin.

Rear Axle Assembly

REMOVAL & INSTALLATION

Caravan, Voyager and Town & Country

1. Raise the vehicle and support safely.
2. Disconnect the brake hose connection from the axle tube.
3. Unclip the brake tubes from the axle housing.
4. Support the axle tube with jack stands.
5. Unbolt the shock absorbers from the axle.
6. Unbolt the axle tube from the leaf springs.
7. Remove the axle from the vehicle.
8. The installation is the reverse of the removal procedure.

VEHICLE IDENTIFICATION CHART

It is important for servicing and ordering parts to be certain of the vehicle and engine identification. The VIN (vehicle identification number) is a 17 digit number visible through the windshield on the driver's side of the dash and contains the vehicle and engine identification codes. The tenth digit indicates model year and the eighth digit indicates engine code. It can be interpreted as follows:

Engine Code					
Code	Cu. In.	Liters	Cyl.	Fuel Sys.	Eng. Mfg.
Y (86)	300	4.9	6	1bbl	Ford
Y (87-90)	300	4.9	6	EFI	Ford
N	302	5.0	8	EFI	Ford
H (86-87)	351 (HD)	5.8	8	4bbl	Ford
H (88-90)	351	5.8	8	EFI	Ford
I	420	6.9	8	Diesel	International Harvester ①
M	445	7.3	8	Diesel	Navistar
G	460	7.5	8	EFI	Ford
L	460	7.5	8	4bbl	Ford

Model Year	
Code	Year
G	1986
H	1987
J	1988
K	1989
L	1990

① Navistar—1987

① Curb idle speed is specified on the Vehicle Emissions Control Information Decal

② ATDC @ 1400 rpm fuel cetane value of 47 or greater

③ BTDC @ 2000 rpm

FIRING ORDERS

NOTE: To avoid confusion, always replace spark plug wires one at a time.

351 (5.8L) V8 engine
Firing order: 1-3-7-2-6-5-4-8

302 (5.0L) and 460 (7.5L) V8 engines
Firing order: 1-5-4-2-6-3-7-8
Distributor rotation: counterclockwise

300 (4.9L) 6 cylinder engine
Firing order: 1-5-3-6-2-4
Distributor rotation: clockwise

420 (6.9L) and 445 (7.3L) Diesel engines
Firing order: 1-2-7-3-4-5-6-8

① Torque in 3 steps 55 ft. lbs., 60 ft. lbs. and 85 ft. lbs.

② Torque in 2 steps 55-65 ft. lbs. and 65-72 ft. lbs.

③ Torque in 3 steps 85, 95 ft. lbs. and 105-112 ft. lbs.

④ Torque to 40 ft. lbs. then 70 ft. lbs. and then to 80 ft. lbs. then torque to 80 ft. lbs. again in sequence

⑤ Torque in 2 steps 75 ft. lbs. then 95 ft. lbs.

⑥ Torque in 2 steps 38 ft. lbs. then to 49-54 ft. lbs.

⑦ Torque in 3 steps 80-90 ft. lbs., 100-110 ft. lbs. then to 130-140 ft. lbs.

⑧ Torque 65 ft. lbs. then to 90 ft. lbs. then 100 ft. lbs.

ENGINE ELECTRICAL

NOTE: Disconnecting the negative battery cable on some vehicles may interfere with the functions of the on board computer systems and may require the computer to undergo a relearning process, once the negative battery cable is reconnected.

Distributor

REMOVAL & INSTALLATION

Duraspark II System

1. Disconnect the negative battery cable. Remove the distributor cap and position the cap and ignition wires to the side.
2. Disconnect and plug the vacuum hose(s) from the vacuum diaphragm assembly.
3. Disconnect the wire harness plug from the distributor connector.

4. Rotate the engine to align the stator pole and armature pole.

5. Scribe a mark on the distributor body and engine block to indicate the position of the rotor tip and position of the distributor in the engine.

6. Remove the holddown bolt and clamp located at the base of the distributor.

7. Remove the distributor from the engine. Do not rotate the engine while the distributor is removed.

To install:

8. Position the distributor in the engine with the rotor aligned to the

marks made on the distributor, or to the place the rotor pointed when the distributor was removed.

9. Install the mounting bolt and clamp, but do not tighten so the distributor can be turned for ignition timing purposes.

10. If the engine was rotated while the distributor was removed, rotate the engine (in normal direction of rotation) until No. 1 piston is on TDC (Top Dead Center) of the compression stroke. The TDC mark on the crankshaft pulley and the pointer should align. Rotor tip pointing at No. 1 spark plug wire position on distributor cap upon installation.

11. Engage the oil pump intermediate shaft and insert the distributor until fully seated on the engine, if the distributor does not fully seat, turn the engine slightly to fully engage the intermediate shaft.

NOTE: The oil pump intermediate shaft may be turned with a tool to align the shaft with the distributor.

12. Rotate the distributor in block if necessary to align armature and stator assembly poles. Install the distributor holddown bolt but do not fully tighten.

13. Check that No. 1 piston is on compression stroke and timing marks and rotor are aligned in the correct position.

14. Connect distributor to wiring harness connection.

15. Install the distributor cap and wires in the correct position.

16. Set the initial timing to specifications as shown on the Vehicle Emission Control Information Decal.

17. Tighten the distributor holddown bolt to 17-25 ft. lbs. Recheck the initial timing and readjust if necessary. Connect the diaphragm assembly hose(s).

TFI-IV System (Thick Film Integrated)

1. Disconnect the negative battery cable. Disconnect the primary wiring connector from the distributor.

2. Remove the distributor cap and adapter and position it and the attached wires out of the way.

NOTE: Before removing the distributor cap, mark the position of the No. 1 wire tower on the distributor base for installation purposes.

3. Remove the rotor. Remove the TFI connector.

4. Remove the distributor holddown bolt (some engines may be equipped with security-type holddown bolt) and clamp.

5. Avoid turning the engine, if possible, while the distributor is removed. If the engine is turned from TDC posi-

tion, TDC timing marks will have to be reset.

To install:

6. Rotate the distributor in the engine block to align the leading edge of the vane and the vane switch (vane should be centered in the vane switch stator assembly).

7. Check that No. 1 piston is on compression stroke and timing marks and rotor (rotor tip pointing at No. 1 spark plug wire position on distributor cap) are aligned in the correct position.

8. After the distributor has been fully seated on the block, install the hold down bracket and bolt. Do not fully tighten at this time.

9. Connect the distributor TFI and primary wiring harnesses.

10. Install the distributor rotor and cap adapter. Tighten the attaching screws to 2.1-2.9 ft. lbs.

11. Install the distributor cap and wires in the correct position.

12. Set the initial timing to specifications as shown on the Vehicle Emission Control Information Decal.

13. Tighten the distributor holddown bolt to 17-25 ft. lbs. Recheck the initial timing and readjust if necessary.

Ignition Timing

ADJUSTMENT

The procedure below is for setting initial timing only. This procedure is to

Duraspark II Ignition system

Thick film Integrated (TFI) Ignition system with universal distributor

be used under normal circumstances. If problems are encountered setting initial timing using this procedure than further diagnosis is necessary.

1. Place the transmission in **P** or **N**. Turn the air conditioner and heater to the **OFF** position.

2. Remove the vacuum hoses from the distributor vacuum advance con-

nection at the distributor and plug the hoses on Non-EEC systems.

3. Connect inductive timing light and tachometer (Non-EEC systems).

4. Disconnect the single wire in-line spout connector (near the distributor) or remove the shorting bar from the double spout connector on EEC-IV systems.

5. If the vehicle is equipped on Non-EEC systems with a barometric pressure switch disconnect it from the ignition module. Install a jumper wire across the pins at the ignition module connector (yellow and black wires).

6. Start the engine and allow it to reach normal operating temperature.

7. With the engine at the timing

Typical schematic of Duraspark II Ignition system

rpm if specified, check initial timing.

Alternator

BELT TENSION ADJUSTMENT

Manually Tensioned Belt

1. Loosen alternator adjustment and pivot bolts.
2. Pry on alternator housing using a suitable tool to attain correct belt tension. Use caution not to damage alternator housing.
3. Tighten adjustment bolt and release pressure on tool.
4. Tighten pivot bolt and check belt tension.
5. The belt tension measurement specifications are if belt span is less than 12 inches the deflection should be $\frac{1}{8}$ – $\frac{1}{4}$ in. If belt span is more than 12 inches the deflection should be $\frac{1}{8}$ – $\frac{3}{8}$ in.

Automatically Tensioned Belt

The automatic belt tensioner will

Typical schematic of TFI ignition system with universal distributor

Typical schematic of TFI system with closed bowl distributor

Armature/stator assembly alignment

Tachometer connection

Closed bowl distributor

MAKE SURE RULER IS PERPENDICULAR TO STRAIGHT EDGE

Manual belt deflection method

Exploded view universal distributor

maintain correct belt tension if the correct length belt is used on the engine. To verify that the tensioner is working properly check to see that the belt length indicator mark on the tensioner is between the maximum and minimum marks. The belt tensioner has no provision for adjustment and will be damaged if forced to travel beyond the normal operating range.

REMOVAL & INSTALLATION

1. Disconnect battery ground cable(s).
2. Remove all electrical connectors from the alternator.
3. Loosen the alternator mounting bolts and remove the adjustment arm to alternator attaching bolt.
4. Disengage the alternator belt.
5. Remove the alternator mounting bolt and alternator. Remove the alternator fan shield if so equipped.
6. Installation is the reverse of the removal procedure.

INDICATOR SHOULD BE BETWEEN MARKS

Typical automatic belt tensioner

INDICATOR SHOULD BE BETWEEN MARKS

Typical automatic belt tensioner

Voltage Regulator

For further information on the charging system, please refer to "Charging and Starting" in the Unit Repair section.

ADJUSTMENT

External Regulator

These regulators are 100 percent solid state, consisting of transistors, diodes and resistors. They are calibrated and preset by the manufacturer. No readjustment is required or possible on these units.

REMOVAL & INSTALLATION

NOTE: Removing the voltage regulator electrical connector from an ungrounded regulator with the ignition switch ON will destroy the regulator. If vehicle is equipped with an electric choke, be sure to disconnect electric choke wire from stator terminal of the alternator when working on the charging system. Check electric choke wire for a ground condition.

1. Disconnect the battery ground cable(s).
2. Remove the regulator mounting screws.
3. Disconnect the regulator from the wiring harness.
4. Installation is the reverse of the removal procedure.

Starter

For further information on the charging system, please refer to "Charging and Starting" in the Unit Repair section.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable(s).
2. Raise the vehicle and support it safely.
3. Disconnect starter cable at the starter terminal. Remove the starter mounting bolts.
4. Remove the starter assembly.

To install:

5. Position the starter assembly to the flywheel housing and start the mounting bolts.
6. Snug all the bolts while holding the starter squarely against its mounting surface and fully inserted into the pilot hole. Tighten the bolts to 15-20 ft. lbs.
7. Reconnect the starter cable at the starter terminal. Lower the vehicle. Connect the negative battery cable(s).

Charging system with electronic regulator and ammeter

Exploded view of typical ford starter

Glow plug engine harness

Diesel Glow Plugs

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Disconnect the glow plug electrical leads.
2. Remove the glow plugs by unscrewing them from the cylinder head.
3. Inspect the tips of the plugs for any evidence of melting. If a glow plug tip looks bad, all the glow plugs must be replaced.
4. Installation is the reverse of the removal procedure.

CHASSIS ELECTRICAL

Heater Blower Motor

REMOVAL & INSTALLATION

With Air Conditioning

BRONCO AND F SERIES

1. Disconnect the negative battery cable. Disconnect the motor connector.
2. Disconnect the air cooling tube from the motor.
3. Remove the 4 mounting plate screws and remove the motor and

wheel assembly from the blower housing.

4. Installation is the reverse of removal procedure.

E SERIES

NOTE: On late models remove the blower motor mounting plate from the evaporator case then remove the blower motor from evaporator case.

1. Disconnect the negative battery cable. Disconnect the electrical leads from the resistor on the front face of the A/C blower scroll cover. Remove the scroll cover.
2. Push the wiring grommet forward out of the hole in the blower housing.

3. Remove the four screws from the blower motor mounting plate.

4. Remove the motor and wheel assembly.

5. Installation is the reverse of removal procedure.

Without Air Conditioning BRONCO AND F SERIES

1. Disconnect the negative battery cable(s).
2. On California vehicles, remove the emission module forward of the blower motor.
3. Disconnect the wire harness connection from the motor by pushing down on the tab while pulling the connector off at the motor.

E series blower motor installation

E series blower motor installation hi-output system

4. Disconnect the cooling tube from the blower motor.

5. Remove the blower motor retaining screws.

6. Position the cooling tube aside, pull the motor and wheel assembly from the blower housing.

7. Installation is the reverse of removal procedure.

E SERIES

1. Disconnect the negative battery cable. Disconnect the lead wire (orange/black) at the wiring harness.

2. Remove the ground wire (black) mounting from the heater blower assembly.

3. Remove the 3 mounting plate screws and remove the motor and wheel assembly.

4. Install in reverse order.

Windshield Wiper Motor

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable(s).

2. On E series, remove the fuse panel, bracket assembly and cover assemblies.

3. Remove both wiper arm and blade assemblies.

4. Disconnect the washer nozzle hose and remove the cowl grille assembly.

5. Remove the wiper linkage clip from the motor output arm.

6. Disconnect the motor wiring connector.

7. Remove the 3 attaching screws and remove the motor.

(*) MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR IS NOT PART OF A/C SYSTEM.

F series and Bronco blower motor installation

8. Installation is the reverse of removal procedure. Always ensure the wiper motor is in the park position before installing. Torque the wiper motor retaining screws to 60-85 in. lbs.

Windshield Wiper Switch

REMOVAL & INSTALLATION

Bronco and F Series

1. Disconnect the negative battery cable(s).
2. Remove the wiper switch knob and bezel.
3. Pull out the switch from under the instrument panel.
4. Disconnect the plug connector from the switch and remove the switch.
5. Reverse the procedure for installation.

E Series

1. Disconnect the negative battery cable(s).
2. Remove the windshield wiper switch knob.
3. Remove the ignition switch bezel.
4. Remove the headlamp switch knob and shaft by pulling the switch to the ON position. Depress the button on the top of the switch and pull the knob and shaft out.

5. Remove the 2 screws at the bottom of the finish panel, then pry the 2 upper retainers away from the instrument panel.
6. Disconnect the connector from the switch.
7. Remove the attaching screws and remove the switch.
8. Reverse the procedure for installation.

Instrument Cluster

REMOVAL & INSTALLATION

Bronco and F Series

1. Disconnect the negative battery cable(s).
2. Remove the wiper/washer knob using a hook tool to release each knob lock tab.
3. Remove the knob from the headlamp switch. Remove the fog lamp switch knob, if so equipped.
4. Remove the steering column shroud.
5. If equipped with an automatic transmission, remove the loop on the indicator cable assembly from the retainer pin. Open the cable retaining clips. Remove the screw from the cable bracket and slide the bracket out of the slot in the tube.
6. Remove the cluster finish panel assembly.
7. Remove the 4 cluster attaching

screws and disconnect the speedometer cable.

8. Disconnect the wire connector from the printed circuit.

9. Disconnect the 4WD indicator light, if so equipped and remove the cluster.

10. Installation is the reverse of the removal procedure.

E Series

1. Disconnect the negative battery cable(s).
2. Remove the steering column shroud if necessary.
3. If equipped with a tilt steering column, loosen the bolts which attach the column to the band support to provide sufficient clearance for cluster removal.
4. Remove the 7 cluster to panel retaining screws.
5. Position the cluster away from the panel to disconnect the speedometer cable.
6. Disconnect the harness connector plug from the printed circuit and remove the cluster assembly.
7. Installation is the reverse of the removal procedure.

Speedometer

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Remove the instrument cluster.
2. Remove the lens and mask from the cluster.
3. Remove the 2 speedometer attaching screws and remove the speedometer cable.
4. Remove the speedometer.
5. Reverse the procedure for installation. If a new speedometer head is being installed, examine the square drive hole for sufficient lubrication.

Radio

REMOVAL & INSTALLATION

Bronco and F Series

1. Disconnect the battery ground cable(s).
2. Remove bezel.
3. Remove the screws securing radio mounting bracket to instrument panel. Remove the radio.
4. Disconnect the antenna cable, speaker wires and power wire.
5. Installation is the reverse of the removal procedure.

E Series

1. Disconnect the battery ground cable(s).
2. Remove the heater, A/C control knobs and cigar lighter if so equipped.

Windshield wiper control switch installation-E series

Instrument cluster-E series

Speedometer cable quick connect

3. Remove all finish panel attaching screws. Remove the finish panel (cluster panel).
4. Remove the front radio retaining screws and remove the radio.
5. Disconnect the antenna cable, speaker wires and power wire.
6. Installation is the reverse of the removal procedure.

Headlight Switch

REMOVAL & INSTALLATION

Bronco and F Series

1. Disconnect the negative battery cable(s).
2. Remove the wiper/washer and headlamp switch knobs using a hook tool to release each knob lock tab.
3. Remove the fog lamp switch knob if so equipped.
4. Remove the steering column shroud and the cluster finish panel.

Typical headlamp switch

5. Remove the switch from the instrument panel then the wiring connector from the switch.
6. Installation is the reverse of the removal procedure.

E Series

1. Disconnect the negative battery cable(s).
2. Pull the headlamp switch knob to the full ON position. Depress the shaft release button and remove the knob and shaft assembly.
3. Remove the instrument panel finish panel.
4. Unscrew the mounting nut. Remove the switch, then remove the wiring connector from the switch.
5. Installation is the reverse of the removal procedure.

Dimmer Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable(s).
2. Pull back floor mat or carpet in the area of the switch. Remove the dimmer switch retaining screws.
3. Disconnect the electrical connection from the switch.
4. Installation is the reverse of the removal procedure.

Turn Signal Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable(s).
2. Remove the horn switch.
3. Remove the steering wheel.
4. Unscrew the turn signal switch lever from the steering column.
5. Remove the steering column shroud and the opening cover if so equipped.
6. Disconnect the switch wiring connector.

7. Remove the screws that secure the switch to the column.

8. Vehicles equipped with a fixed column, remove the switch by lifting it out of the column and guiding the connector plug through the opening in the shift socket. On E series with automatic transmission, also remove the PRNDL lamp assembly from the shift socket.

9. Vehicles equipped with a tilt column require disassembly of the turn signal switch harness plug before removing the switch from the column. On E series with automatic transmission, remove the PRNDL lamp wire from the turn signal switch harness sheath.

10. Reverse the procedure for installation. Tighten turn signal lever to 10-20 in. lbs. Install steering wheel retaining nut to 30-40 ft. lbs.

Ignition Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable(s).
2. Remove the steering column shroud and lower the steering column.
3. Disconnect the switch wiring at the multiple plug.

Wire terminal removal-tilt wheel only

Stoplight Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Disconnect electrical connection from the switch. Locking tab must be lifted before connector can be removed.

2. Remove the hairpin retainer. Slide switch, master cylinder pushrod, nylon washer and bushing away from the pedal. Remove the washer, then switch by sliding switch up or down.

To install:

3. Position switch so that U-shaped side is nearest the pedal and directly over/under the pin. Then slide switch up/down installing the master cylinder pushrod and bushing between the switch side plates.

4. Push switch and pushrod assembly toward brake pedal arm. Install outside plastic washer to pin. Install the hairpin retainer (do not substitute for this retainer-use only factory supplied retainer) to entire assembly.

5. Install electrical connection to switch. Make sure switch wire harness has sufficient length to travel with switch during full stroke of brake pedal. Check switch for proper operation.

Wire connector removal

4. Remove the 2 nuts that hold the switch to the steering column.

5. Lift the switch upward to disengage the actuator rod and remove the switch.

6. To install the switch, the locking mechanism at the top of the column and the switch must be in the **LOCK** position for correct adjustment.

7. To hold the parts of the column in the **LOCK** position, move the shift

lever into **P** (with automatic transmission) or **R** (with manual transmission), turn the key to the **LOCK** position and remove the key. New replacement switches are already pinned in the **LOCK** position.

8. Reverse the removal procedure for installation. Tighten the ignition switch retaining screws to 40-65 inch lbs. Check system in each range for proper operation.

Ignition switch installation

Clutch Switch

REMOVAL & INSTALLATION

Bronco and F Series

1. Disconnect the negative battery cable. Disconnect the wiring harness from the switch.
2. Pull down on the orientation clip to separate it from the tab on the switch.
3. Rotate the switch to expose the plastic retainer.
4. Push the tabs together to allow the retainer to slide rearward and separate from the switch.
5. Remove the switch from the clutch master cylinder pushrod.
6. Installation is the reverse of the removal procedure.

E Series

1. Disconnect the negative battery cable. Remove the nut and bolt attaching switch to bracket.
2. Disconnect the switch connector.
3. Installation is the reverse of the removal procedure.

Fuses and Circuit Breakers

LOCATION

The fuse panel for the Bronco and F series vehicles is located on the firewall under the instrument panel left of the steering column. The fuse panel for the E series vehicles is located on the mounting bracket under the instrument panel left of the steering column. Circuit breakers are located in the fuse panel.

Clutch/starter interlock switch—E series

ENGINE COOLING

Radiator

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Drain the cooling system by removing the cap and opening the drain cock located at the lower rear corner of the radiator.
2. Remove the overflow tube from the coolant recovery bottle and shroud as necessary.
3. Remove the radiator shroud retaining bolts and position it out of the way.
4. Remove all water hoses from the radiator.
5. Disconnect the automatic transmission oil cooling lines if equipped.
6. Remove the radiator retaining bolts and tilt the radiator back to clear radiator support for removal from the vehicle.
7. Installation is the reverse of the removal procedure.

Heater Core

REMOVAL & INSTALLATION

With Air Conditioning

BRONCO AND F SERIES

1. Disconnect the negative battery cable(s). Disconnect the heater hoses from the heater core tubes and plug the hoses.

2. Remove the glove compartment liner.

3. Remove 8 screws attaching the heater core cover to the plenum and remove the cover. Remove and tag all vacuum lines.

4. Remove the heater core from the plenum.

5. Installation is the reverse of removal.

1986-87 E SERIES

1. Disconnect the negative battery cable(s). Disconnect the resistor electrical leads on the front of the blower cover inside the vehicle. Detach the vacuum line from the vacuum motor. Remove the blower cover.

2. Remove the nut and push washer from the air door shaft. Remove the control cable from the bracket and the air door shaft.

3. Remove the blower motor housing and the air door housing.

4. Drain the coolant and detach the heater hoses.

5. Remove the heater core retaining brackets. Remove the core and seal assembly.

6. Reverse the procedure for installation.

1988-90 E SERIES

1. Disconnect the negative battery cable(s). Disconnect and plug heater hoses from the heater core.

2. Remove the modesty panel from underside of instrument panel.

3. Remove the 4 screws from the heater core cover located on the left side of the heater case underneath the instrument panel.

4. Remove the heater core cover.

5. Remove heater core retaining bracket from assembly.

Clutch/starter interlock switch—Bronco and F series

Heater core-E series with air conditioning 1988-90

Heater core-Bronco and F series with air conditioning

6. Remove the heater core and seal from case.

7. Reverse the procedure for installation. Check heater system for proper operation.

Without Air Conditioning

1986 BRONCO AND F SERIES

1. Disconnect the negative battery cable(s).

2. Disconnect the temperature cable from the temperature blend door and the mounting bracket on top of the heater case.

3. Disconnect the wires from the blower motor resistor and the blower motor.

4. Disconnect the heater hoses from the heater core and plug the hoses.

5. Working under the instrument panel, remove nuts retaining the left end of the heater case and the right end of the plenum to the dash panel.

6. In the engine compartment, remove screw attaching the top center of the heater to the dash panel.

7. Remove screws attaching the right end of the heater case to the dash panel and remove the heater case from the vehicle.

8. Remove screws and bolt/nut attaching the heater housing plate to the heater case and remove the heater housing plate.

9. Remove the heater core and seal from the heater case.

10. Reverse the procedure for installation. Check heater system for proper operation.

1987-90 BRONCO AND F SERIES

1. Disconnect the negative battery cable(s). Disconnect the heater hoses from the heater core tubes and plug the hoses.

2. Remove the glove compartment liner.

3. Remove 8 screws attaching the heater core cover to the plenum and remove the cover. Remove and tag all vacuum lines.

4. Remove the heater core from the plenum.

5. Installation is the reverse of removal.

1986-87 E SERIES

1. Disconnect the negative battery cable(s). Drain the coolant and remove the battery.

2. Disconnect the resistor wiring harness and the orange blower motor lead. Remove the ground wire screw from the firewall.

3. Detach the heater hoses and the plastic hose retaining strap.

4. Remove the 5 mounting screws inside the vehicle.

5. Remove the heater assembly.

6. Cut the seal at the top and bot-

Heater core—Bronco and F series without air conditioning 1986

tom edge of the core retainer. Remove the 2 screws and the retainer. Slide the core and seal out of the case.

7. Reverse the procedure for installation.

1988-90 E SERIES

1. Disconnect the negative battery cable(s). Disconnect and plug heater hoses from the heater core.

2. Remove the modesty panel from underside of instrument panel.

3. Remove the 4 screws from the heater core cover located on the left side of the heater case underneath the instrument panel.

4. Remove the heater core cover.

5. Remove heater core retaining bracket from assembly.

6. Remove the heater core and seal from case.

7. Reverse the procedure for installation. Check heater system for proper operation.

Water Pump

REMOVAL & INSTALLATION

4.9L Engine

1. Disconnect the negative battery cable. Drain cooling system.

2. Disconnect radiator lower hose and heater hose at the water pump.

3. Remove fan belt, fan and water

pump pulley. Remove the air pump and alternator belts.

4. On vehicles equipped with air conditioning, remove the belt as required.

5. Remove water pump retaining bolts, then remove pump and gasket.

To install:

6. Clean mating gasket surfaces of pump body and engine block.

7. If a new water pump is being installed, remove the fittings from the old pump and install them on the new pump.

8. Coat new gasket with water-resistant sealer on both sides and install gasket and pump on engine. Tighten mounting bolts to 12-18 ft. lbs.

9. Install water pump pulley, fan and fan belt and adjust fan belt tension.

10. If so equipped, install air compressor belt.

11. Connect radiator and heater hoses.

12. Fill and bleed cooling system. Check for leaks and recheck coolant level.

5.0L and 5.8L Engines

1. Disconnect the negative battery cable. Drain the cooling system. On E series remove the air cleaner and intake duct assembly.

2. Remove the bolts securing the

fan shroud to the radiator, if so equipped and position the shroud over the fan. On E series remove the radiator assembly.

3. Disconnect the lower radiator hose, heater hose and by-pass hose at the water pump. Remove the drive belts, fan, fan spacer and pulley. Remove the fan shroud, if so equipped.

4. Loosen the alternator pivot bolt and the bolt attaching the alternator adjusting arm to the water pump.

5. Remove the bolts securing the water pump to the timing chain cover and remove the water pump.

6. Installation is the reverse of removal procedure. Tighten water pump bolts to 12-18 ft. lbs on installation. Fill and bleed cooling system. Check for leaks and recheck coolant level.

6.9L and 7.3L Engines

1. Disconnect the negative battery cable(s). Drain the cooling system and remove the fan shroud halves.

NOTE: Fan and clutch assembly has a left hand thread. Remove by turning nut clockwise.

2. Remove the fan and clutch assembly.

3. Remove all drive belts and water pump pulley.

4. Disconnect heater hose and hose fitting from the water pump.
5. Remove alternator adjusting arm and arm bracket.
6. Remove the air conditioning compressor attaching bolts and secure the compressor out of the way.
7. Remove the air conditioning compressor brackets.
8. Remove the power steering pump and bracket position out of the way.
9. Remove water pump retaining bolts. Remove the water pump from the engine.
10. Installation is the reverse of removal procedure. Install the water pump using a new gasket and water-proof sealer.
11. Tighten water pump retaining bolts to 15 ft. lbs. Tighten fan clutch assembly bolt (counterclockwise) 163 ft. lbs. Fill and bleed cooling system.

7.5L Engine

1. Disconnect the negative battery cable. Drain the cooling system and remove the fan shroud attaching bolts.
2. Remove the fan assembly attaching screws and remove the shroud and fan.
3. Loosen the power steering pump attaching bolts.
4. If the vehicle is equipped with air conditioning, loosen the compressor attaching bolts and remove the air conditioning compressor and power steering pump drive belts.
5. Loosen the alternator pivot bolt. Remove the 2 attaching bolts and spacer. Remove the drive belt, then rotate the bracket out of the way.
6. Remove the 3 air conditioning compressor attaching bolts and secure the compressor out of the way.
7. Remove the power steering pump attaching bolts and position the pump to one side.
8. Remove the air conditioner bracket attaching bolts and remove the bracket.
9. Disconnect the lower radiator hose and heater hose from the water pump.
10. Loosen the bypass hose clamp at the water pump.
11. Remove the water pump attaching bolts and remove the pump from the front cover. Remove the separator plate from the pump. Discard the gaskets.
12. Remove all gasket material from all of the mating surfaces.
13. Install the water pump in the reverse order of removal, using a new gasket and waterproof sealer.
14. Tighten water pump retaining bolts to 15–21 ft. lbs. Fill and bleed cooling system.

APPLY AVIATION PERMATEX[®]
NO. 3 OR EQUIVALENT
TO THESE BOLTS

- ① THESE BOLTS 2 3/4-INCHES LONG.
ALL OTHERS ARE 1 1/2 INCHES LONG.

Water pump—7.3L diesel engine

Fan clutch assembly—7.3L diesel engine

Thermostat

REMOVAL & INSTALLATION

Gasoline Engine

1. Disconnect the negative battery cable. Drain the radiator so that the coolant level is below the thermostat.
2. If equipped with a V8 engine, disconnect the bypass hoses at the water pump and the intake manifold. Remove the bypass tube.
3. Remove the water outlet housing attaching bolts and pull the housing away from the engine to gain access to the thermostat.
4. Installation is the reverse of removal procedure. Fill and bleed cooling system as necessary.

Diesel Engine

1. Disconnect ground cables from both batteries.

2. Drain the radiator so that the coolant level is below the thermostat.
3. Remove the alternator and vacuum pump drive belts.
4. Remove the alternator, vacuum pump and position out of the way.
5. Remove the water outlet housing attaching bolts and pull the housing away from the engine to gain access to the thermostat.
6. Installation is the reverse of removal procedure. Fill and bleed cooling system as necessary.

COOLING SYSTEM BLEEDING

To bleed cooling system disconnect the heater outlet hose at the water pump to bleed or release trapped air in the system. When the coolant begins to escape, connect the heater outlet.

GASOLINE FUEL SYSTEM

Fuel Service Precautions

Always disconnect the negative battery cable if possible. Never smoke, carry lighted tobacco, open flame and keep a Class B dry chemical fire extinguisher available. Always relieve the fuel pressure before working on any fuel system component.

RELIEVING FUEL SYSTEM PRESSURE

1. Open hood and install protective covers.
2. Disconnect battery ground cable.
3. Remove the fuel cap from the gas tank. A valve at the fuel injection rail can be bled for this purpose.
4. Alternate method is to remove the fuel pump relay or disconnect the electrical connection to the high pressure fuel pump.
5. Crank engine for approximately 10 seconds. If engine runs wait till engine stalls and crank engine an additional 5 seconds then disconnect the negative battery cable.

Fuel Filter

REMOVAL & INSTALLATION

Carbureted Vehicle

1. Disconnect the negative battery cable. Remove the air cleaner.
2. Loosen (hold filter with backup wrench) and remove the fuel tube from the filter.
3. Remove the filter from the carburetor. If a inlet type fuel filter is used remove the fuel inlet fitting then remove the gasket, filter and spring.
4. Installation is the reverse of removal procedure. Always hand start filter threads before tightening with wrench.

Fuel Injected Vehicle

NOTE: If vehicle has in-line reservoir fuel filter type relieve fuel pressure. Unscrew the lower canister using a flexible type oil filter wrench and slide filter and canister out from the frame rail.

1. Relieve fuel pressure. Disconnect the battery ground cable.
2. Raise and support the vehicle safely.
3. Loosen screw clamp slide filter

forward. Remove fuel lines from the filter. Some late models have push type connection fittings.

4. Remove fuel filter from mounting bracket.

5. Installation is the reverse of removal procedure. Always hand start filter gas line threads before tightening with wrench.

Mechanical Fuel Pump

PRESSURE TESTING

1. Remove the air cleaner. Connect a suitable pressure gauge to carburetor end of the fuel line.
2. Start the engine and read the fuel pressure after 10 seconds. The fuel pressure should be 5-7 psi on 4.9L engine. On the 5.0L, 5.8L and 7.5L engines the pressure should be 6-8 psi with the fuel return line closed, if equipped.
3. Reconnect the fuel line and install the air cleaner.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Loosen the threaded connections and then retighten them snugly. Do not remove the lines at this time.
2. Loosen the mounting bolts about 2 turns and loosen the fuel pump from the engine.
3. Rotate the engine until the fuel pump cam lobe is near its low position.
4. Disconnect the fuel pump inlet, outlet (wrap shop towel around fitting) and vapor return line, if so equipped.

Typical fuel filter

5. Remove the fuel pump attaching bolts and remove the fuel pump and gasket.

6. Installation is the reverse of removal procedure. Install the fuel pump with a new mounting gasket and torque the retaining bolts to evenly to 19-27 ft. lbs. on 5.0L, 5.8L and 7.5L engines and 12-18 ft. lbs. on 4.9L engine.

Electric Fuel Pump

REMOVAL & INSTALLATION

In-Tank Pump

1. Disconnect the negative battery cable.
2. Depressurize the system and drain as much gas from the tank by pumping out through the filler neck.
3. Raise the vehicle and safely support it.
4. Disconnect and plug the fuel supply, return and vent lines as necessary.
5. Disconnect the wiring harness to the fuel pump.
6. Support the gas tank, loosen and remove the mounting straps. Remove the gas tank.

Testing mechanical pump

7. Disconnect the lines and harness at the pump flange.

8. Clean the outside of the mounting flange and retaining ring. Turn the fuel pump lock ring counterclockwise and remove.

9. Remove the fuel pump.

10. Clean the mount faces. Put a light coat of grease on the mounting surfaces and on the new sealing ring. Install the new fuel pump.

11. Installation is in the reverse order of removal. Fill the tank with at least 10 gallons of gas. Turn the ignition key **ON** for 3 seconds. Repeat 6 or 7 times until the fuel system is pressurized. Check for any fitting leaks. Start the engine and check for leaks.

Typical high pressure fuel pump

Typical low pressure fuel pump

Gas line spring lock coupling

External Pump

NOTE: The high pressure fuel pump is frame mounted and can be serviced from under the vehicle.

1. Disconnect the negative battery cable.
2. Depressurize the fuel system.
3. Raise and support the vehicle safely.
4. Disconnect and plug the inlet and outlet fuel lines.
5. Remove the pump from the mounting bracket.
6. Install in reverse order, make sure the pump is indexed correctly in the mounting bracket insulator. Always start fuel line threads by hand before tightening with wrench.

Carburetor

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Remove the air cleaner and duct assembly.
2. Remove the throttle cable or rod from the throttle lever. Disconnect the distributor vacuum line, EGR vacuum

line, if so equipped, the inline fuel filter and the choke heat tube at the carburetor.

3. Disconnect the choke clean air tube from the air horn. Disconnect the choke actuating cable, if so equipped. Disconnect the electric choke wire at the connector, if so equipped. Disconnect the governor throttle control lines and governor wire connector at the carburetor, if so equipped.

4. Remove the carburetor retaining nuts, then remove the carburetor. Remove the carburetor mounting gasket, spacer and the lower gasket from the intake manifold.

5. Installation is the reverse of the removal procedure. Adjust the carburetor to specification, as required. Torque the carburetor mounting nuts to 14-20 ft. lbs.

IDLE SPEED ADJUSTMENT

4.9L Engine with YFA 1-V FB and Idle Speed Control Carburetor

1. Block drive wheels, apply parking brake and bring engine to normal operating temperature.
2. Remove the air cleaner and plug vacuum lines at air cleaner.
3. Turn off all accessories.
4. Perform closed throttle plate speed adjustment (kill speed) as follows:
 - a. With the engine **OFF**, locate SELF-TEST connector and SELF-TEST INPUT (STI) connector. These 2 connectors are located on the passenger side of the engine compartment.
 - b. Connect a jumper wire between the STI connector and the signal return pin on the SELF-TEST connector.
 - c. Turn ignition key to the run position. Do not start the engine.

Closed throttle plate speed adjustment—YFA-IV feedback carburetor

d. The ISC plunger will retract. Wait about 10 seconds and shut off key. Remove the jumper wire.

e. Start the engine verify that the anti-diesel setting (when ISC motor is retracted the throttle should rest against anti-diesel screw) is at or below 500 rpm in N.

f. Reset the anti-diesel screw as required. Reconnect the ISC electrical connection.

5. Perform maximum extension speed adjustment as follows:

- a. With engine in **P** or **N** and all accessories off, warm engine to normal operating temperature.
- b. Shut engine **OFF**. Disconnect engine coolant temperature sensor (ECT) connector.
- c. Start engine and open throttle 3 times. Adjust (using Allen wrench) idle speed motor maximum extension to specifications. Refer to Emission decal for correct specifications.

5.8L and 7.5L Engines with 4180-C 4-V Carburetor

1. Block drive wheels, apply parking brake and bring engine to normal operating temperature.
2. Place the transmission in **N** or **P** and turn off all accessories.

TYPICAL 7.9mm (5/16 INCH) PUSH CONNECT

TYPICAL 9.5mm (3/8 INCH) PUSH CONNECT

Gas line push connectors

3. Disconnect and plug vacuum hoses at air bypass valve, EGR valve and purge control valve.

4. Adjust the curb idle speed screw as required. Refer to Emission decal for correct specifications.

IDLE MIXTURE ADJUSTMENT

Propane Enrichment Method

NOTE: Remove the air cleaner when necessary to perform adjustments. Use this service and adjustment procedure as a guide.

1. Bring the engine to normal operation temperature and connect a tachometer.

2. Disconnect the evaporative emission purge hose from the air cleaner. Disconnect the PCV closure hose from the air cleaner and plug the hose.

3. Adjust the curb idle speed to specifications.

4. If vehicle is equipped with thermactor system, revise the dump valve vacuum hoses as follows:

a. For dump valves with 2 vacuum fittings, disconnect and plug the hose(s).

b. For dump valves with 1 fitting, remove the hose at the dump valve and plug it. Connect a slave hose from the dump valve vacuum fitting to an intake manifold vacuum fitting.

5. Place the special gas tool into the air cleaner evaporative purge nipple. With the engine idling, slowly open the propane valve until the engine speed reaches a maximum and then begins to drop. Note the maximum speed increase. If the speed will not drop, check the bottle gas supply. If necessary, repeat the operation with a new bottle gas supply.

a. If the speed increase is within specifications, but not zero rpm, proceed to Step 6. If the speed increase is zero and minus specification is zero, proceed to Step 5d.

b. If the speed increase is higher than specification; enrich the mixture without propane by turning the mixture limiter screws counterclockwise in equal amounts until the rpm increases as necessary. Example: If the increase was 80 rpm and the desired reset is 50 rpm, the mixture screws should be richened to attain a 30 rpm increase. Repeat Steps 3 and 5.

c. If the speed increase is lower than specifications proceed as follows; lean the mixture without propane by turning the mixture screws clockwise in equal amounts until the rpm decreases as necessary. Example: If the increase was zero rpm and

YFA-IV feedback carburetor

Curb Idle adjustment—4180C 4-V carburetor

the desired reset increase is 20 rpm, the mixture screws should be leaned to attain a 20 rpm decrease. Repeat Steps 3 and 5.

d. If the speed increase is zero rpm and the minimum speed gain specification is zero, perform the following speed drop test; Turn the mixture limiters counterclockwise to the maximum rich position. (If the limiters have been removed, do not enrich; assume the mixture screws are already set at the maximum rich position.) Lean the idle fuel mixture by turning the screws clockwise equally as specified. Note the drop in engine rpm.

e. If the speed drop is equal to or

greater than the specified minimum speed drop, return the mixture limiters to the maximum rich position or the mixture screws to the "assumed" maximum rich position. If the engine speed before mixture adjustment was 650 rpm and the speed drop specification is 100 rpm minimum, proceed to Step 6 if the engine speed drops to at least 550 rpm or stalls.

f. If the speed drop is less than the specified minimum speed drop, leave the mixture limiters or screws in the adjusted position and repeat Steps 3 and 5.

6. If the idle limiters were removed, install new blue service limiters at the

maximum rich stop. Check the speed increase after installation of the limiters to be certain that the settings were not disturbed. If the setting is within specification, proceed to Step 7, if not correct as required.

7. Remove the gas tool from the nipple and connect all system components that were removed.

8. Set the curb idle speed to specification if Step 3 required an idle speed adjustment.

9. Turn off the engine and disconnect the tachometer. Remove the limiter caps with appropriate tool if required. Road test the vehicle for proper operation.

SERVICE ADJUSTMENTS

For all carburetor service adjustments procedures and Specifications, please refer to "Carburetor Service" in the Unit Repair section.

Fuel Injection

IDLE SPEED ADJUSTMENT

4.9L, 5.0L, 5.8L and 7.5L EFI Engines

1. With engine **OFF** install feeler gauge between throttle plate stop screw and throttle lever. On 4.9L use 0.050 in. feeler gauge, 5.0L use 0.050 in. automatic transmission and 0.030 in. on manual transmission and on 5.8L use 0.030 in. on automatic and manual transmissions. This step of the procedure is not necessary on the 7.5L engine.

2. Unplug spout connector and verify timing is base plus or minus 2 degrees BTDC.

3. Disconnect idle speed control-air bypass solenoid on all engines.

4. With transmission in **N** or **P** race engine for 30 seconds at 2500 rpm then let engine idle for 2 minutes.

5. Adjust idle speed by turning the throttle plate stop screw as necessary.

6. Repeat Steps 5 and 6. Turn engine to **OFF** position and disconnect battery for 3 minutes on 4.9L and 5.0L engines.

7. Remove the feeler gauge and reconnect the spout connector.

8. Start engine and let engine stabilize for 2 minutes. Road test the vehicle to check for proper operating conditions.

Fuel Injector

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

4.9L, 5.0L and 5.8L engines EFI throttle body

2. Release the pressure from the fuel system.

3. Remove the upper intake manifold as follows:

a. Disconnect the electrical connectors at the air bypass valve, throttle position sensor and EGR position sensor.

b. Disconnect the throttle linkage at the throttle ball and the AOD transmission linkage if so equipped from the throttle body.

c. Disconnect all vacuum lines to the upper intake, EGR valve and the fuel pressure regulator.

d. Disconnect the PCV system hose from the rear of the upper manifold.

e. Remove the canister purge lines and the water heater lines from the fittings on the throttle body.

f. Disconnect the EGR tube from the valve by removing the flange nut.

4.9L engine EFI upper intake manifold assembly

g. Remove the upper intake manifold retaining bolts and remove it and the throttle body as an assembly.

4. Remove the fuel supply manifold as follows:

a. Disconnect the fuel chassis inlet and outlet fuel hoses from the fuel supply manifold.

b. Disconnect the fuel supply and the return line connections.

c. Remove the manifold retaining bolts. Disengage the manifold from the injectors and remove it.

5. Remove the electrical harness connectors from the injectors and remove the injectors.

6. Installation is the reverse of the removal procedure. Never use silicone grease on injector O-rings it may clog the injectors. Torque the upper manifold retaining bolts to 12-18 ft. lbs.

7.5L engine EFI throttle body

DIESEL FUEL SYSTEM

Fuel Filter

REPLACEMENT

1. Disconnect the battery ground cables from both batteries.

2. Drain fuel from the fuel filter.

3. Remove the water drain tube from the bottom of the filter assembly.

4. Unscrew water separator drain bowl and remove. Remove the filter element.

5. Installation is the reverse of the removal procedure. Screw filter element onto filter base until seal con-

tacts then tighten filter 1/2-1 turn additional.

DRAINING WATER FROM THE SYSTEM

1. Turn ignition to the **OFF** position.

2. Place container under fuel filter/water separator drain tube.

3. Open drain valve. Allow drain valve to remain open approximately 15 seconds or until clear diesel fuel flows from the drain tube.

4. Close drain valve. Start engine. Check Water In Fuel Lamp the lamp should not glow.

Diesel Injection Pump

REMOVAL & INSTALLATION

6.9L and 7.3L Engines

1. Disconnect the negative battery cable(s).

2. Remove the engine cover (doghouse cover) on E250 and E350 series.

3. Remove the adapter housing cover plate.

4. Remove bolts attaching injection pump to drive gear.

5. Disconnect all electrical connections to injection pump.

6. Remove the fast idle solenoid bracket assembly to provide access to injection pump mounting nuts.

7. Disconnect accelerator cable and speed control cable from throttle lever, if so equipped.

8. Remove air cleaner and install suitable cover.

9. Remove accelerator cable bracket from intake manifold.

10. On E series vehicles, disconnect fuel inlet line from the fuel filter and cap all lines.

11. On E series vehicles, disconnect fuel return line from fuel filter and cap all lines.

12. On E series vehicles, remove fuel filter bracket attaching bolts and remove fuel filter and bracket as an

Fuel filter/water separator assembly

Injection pump drive gear attaching bolts

Fuel line installation

assembly.

13. Remove fuel return hose and clip from the 90 degree elbow at the governor cover. Always cap all disconnected fuel lines.

14. Remove fuel filter to injection pump fuel line. It is not necessary to remove injection lines from injection pump to remove injection pump. If lines are to be removed, loosen injection line fittings at injection pump before removing it from engine.

15. Remove fuel injection lines from nozzles and cap lines and nozzles to prevent entry of dirt into the system.

16. Remove retaining nuts attaching injection pump to injection pump drive gear cover using special wrench T86T-9000-C or equivalent.

17. If injection pump is to be replaced, loosen injection line retaining clips and injection nozzle fuel lines and cap all fittings.

18. On F series vehicles remove injection pump, with nozzle lines attached, up and out of engine compart-

ment. Do not carry injection pump by injection nozzle fuel lines.

19. On E series vehicles, remove injection pump through passenger compartment. Do not carry injection pump by injection nozzle fuel lines.

To install:

20. Position new O-ring onto drive gear end of injection pump.

21. On F series, install injection pump down and into position. On E series, install injection pump from passenger compartment.

22. Install alignment dowel on injection pump into alignment hole on drive gear. If necessary, rotate pump driveshaft to align drive slot.

23. Install bolts attaching injection pump to drive gear and tighten to 25 ft. lbs.

24. Install nuts attaching injection pump to adapter. Align scribe lines on injection pump flange and injection pump adapter.

25. If injection nozzle fuel lines were

removed from injection pump, install at this time.

26. Remove protective caps from fuel lines. Install fuel line nuts onto nozzles and tighten to 22 ft. lbs. using a suitable wrench.

27. Install fuel inlet line and fuel return line.

28. Install injection pump fitting adapter with a new O-ring.

29. Install elbow (coat elbow threads with pipe sealant) in injection pump adapter and tighten to 6 ft. lbs. Then tighten further, if necessary, to align elbow with injection pump fuel inlet line, but do not exceed 360 degrees of rotation or 10 ft. lbs.

30. Install fuel filter to injection pump fuel line. On E series install fuel filter and bracket as an assembly.

31. Install fuel filter return line and inlet line as necessary.

32. Install accelerator cable bracket to intake manifold and air cleaner.

33. Install accelerator and speed control cable, if so equipped, to throttle

Injection pump mounting

Injection pump cylinder sequence

Idle speed adjustment—diesel engine

Luminosity probe—dynamic timing

lever.

34. Install fast idle solenoid bracket assembly. Reconnect electrical connectors on injection pump.

35. Clean adapter housing cover plate sealing surfaces. Apply a bead of sealant in adapter housing grooves. Install adapter cover tighten retaining bolts to 14 ft. lbs.

36. Install ground cables to both batteries. Start engine and check for fuel leaks. If necessary, bleed high pressure fuel lines of air by loosening connection ½ turn and cranking engine.

37. Adjust injection pump timing. Check idle speed and road test vehicle for proper operation.

IDLE SPEED ADJUSTMENT

1. Run engine to normal operating temperature. Idle speed is determined with manual transmission in **N** and automatic transmission in **D**.

2. Set transmission in **N** or **P**.

3. Check that curb idle adjusting screw is against the stop correct if necessary.

4. Check idle speed, using tachometer or equivalent test equipment. Idle speed is specified on the Vehicle Emissions Control Information decal. Adjust to specification using idle speed adjusting screw.

5. Road test to check for proper operation of the vehicle.

Diesel Injection Timing

ADJUSTMENT

Static Timing

1. Remove fast idle bracket and solenoid from injection pump.

2. Break torque (keeping nuts snug) on 3 nuts attaching injection pump to

pump mounting adapter using special tool T86T-9000-C or equivalent.

3. Install special rotating tool T83T-9000-C or equivalent on front of pump and rotate injection to align timing mark on injection pump mounting flange with timing mark on pump mounting adapter, to with plus or minus 0.030 inch.

4. Remove rotating tool and tighten nuts to 25 ft. lbs.

5. Check timing to verify that timing marks are aligned. Install fast idle bracket and solenoid.

Dynamic Timing

6.9L ENGINE

1. Bring engine up to normal operating temperature. When checking or setting dynamic injection timing it is mandatory that the engine be stabilized at normal operating temperature. This temperature is needed to ensure proper fuel ignition in the precombustion chambers.

2. Obtain fuel sample and check cetane valve using special tester or equivalent.

3. Install special tool dynamic timing meter Rotunda 078-00200 or equivalent, by placing magnetic pickup in timing pointer probe hole. Insert pickup until it almost touches vibration damper.

4. Remove No. 1 glow plug. Install luminosity probe and tighten to 12 ft. lbs. Install photocell over probe.

5. Connect dynamic timing meter to battery and dial in minus 20 degrees offset on meter. Disconnect cold start advance solenoid connector from solenoid terminal.

6. With transmission in **N** and rear wheels raised off the ground, start engine. Using throttle control tool D83T-9000-E or equivalent, set engine speed to 1400 rpm with no acces-

sory load. Observe injection timing on dynamic timing meter.

7. Apply battery voltage to cold start advance solenoid terminal to activate it. Activating cold start advance solenoid can result in engine speed increase. Adjust throttle control to attain 1400 rpm, if necessary.

8. Check timing at 1400 rpm. The timing should be advanced at least 2.5 degrees before the timing obtained in Step 9 of this procedure.

9. If dynamic timing is not within plus or minus 2 degrees of specification, adjustment of pump timing is necessary.

10. Turn engine off. Note timing mark alignment. Remove fast idle bracket and solenoid from injection pump. Break torque (keeping nuts snug) on nuts attaching injection pump to pump mounting adapter.

11. Install special rotating tool, T83T-9000-C or equivalent, on front of pump. Rotate clockwise (when viewed from front of engine) to retard and counterclockwise to advance timing, by lightly tapping tool with a rubber mallet. A 2 degree movement of dynamic timing is approximately 0.030 inch of timing mark movement.

12. Remove rotating tool and tighten

Magnetic pickup—dynamic timing

nuts to 25 ft. lbs. Start engine and re-check timing.

13. Turn engine off. Remove dynamic timing components. Install glow plug and electrical connection. Install fast idle bracket and solenoid.

7.3L ENGINE

1. Bring engine up to normal operating temperature. When checking or setting dynamic injection timing it is mandatory that the engine be stabilized at normal operating temperature. This temperature is needed to ensure proper fuel ignition in the precombustion chambers.

2. Stop engine and install special tool dynamic timing meter Rotunda 078-00200 or equivalent, by placing magnetic pickup in timing pointer probe hole. Insert pickup until it almost touches vibration damper.

3. Install clamp from timing meter adapter Rotunda 078-00201 or equivalent, to the line pressure sensor on No. 1 injector nozzle (F series) and No. 4 injector nozzle (E series) and connect to timing meter.

4. Connect dynamic timing meter to battery and dial in minus 20 degrees offset on meter. Disconnect cold start advance solenoid connector from solenoid terminal.

5. With transmission in N and rear wheels raised off the ground, start engine. Using throttle control tool

D83T-9000-E or equivalent, set engine speed to 2000 rpm with no accessory load. Observe injection timing on dynamic timing meter. Injection timing should be 8.5 degrees BTDC at 2000 rpm.

6. Apply battery voltage to cold start advance solenoid terminal to activate it. Activating cold start advance solenoid can result in engine speed increase. Adjust throttle control to attain 2000 rpm, if necessary.

7. Check timing at 2000 rpm. The timing should be advanced at least 1 degree before the timing obtained in Step 5. If the advance is less than 1 degree, replace fuel injection pump top cover assembly.

8. If dynamic timing is not within plus or minus 2 degrees of specification, adjustment of pump timing is necessary.

9. Turn engine off. Note timing mark alignment. Remove fast idle bracket and solenoid from injection pump. Break torque (keeping nuts snug) on nuts attaching injection pump to pump mounting adapter.

10. Install special rotating tool, T83T-9000-C or equivalent, on front of pump. Rotate clockwise (when viewed from front of engine) to retard and counterclockwise to advance timing, by lightly tapping tool with a rubber mallet. A 2 degree movement of dynamic timing is approximately 0.030

inch of timing mark movement.

11. Remove rotating tool and tighten nuts to 25 ft. lbs. Start engine and re-check timing.

12. Turn engine off. Remove dynamic timing components. Install fast idle bracket and solenoid.

Fuel Nozzles

REMOVAL & INSTALLATION

NOTE: Before removing nozzle assemblies, clean exterior of each nozzle assembly and the surrounding area with solvent to prevent entry of dirt into engine when nozzle assemblies are removed. Always cap all open fuel lines to prevent dirt from entering system.

1. Disconnect the negative battery cable. Disconnect nozzle fuel inlet (high pressure) and fuel leak off tees from each nozzle assembly.

2. Remove fuel leak off lines as an assembly.

3. Remove injection nozzles by turning counterclockwise. Pull nozzle assembly with copper washer from engine. Be careful not to strike nozzle tip against any hard surface during removal.

4. Installation is the reverse of the removal procedure. Thoroughly clean

Fuel line routing and installation

EMW system schematic

nozzle bore in cylinder head before reinserting nozzle assembly. Tighten nozzle assembly to 35 ft. lbs. Bleed fuel system if necessary.

EMISSION CONTROLS

Please refer to "Emission Control" in the Unit Repair section for system maintenance procedures. Due to the complex nature of modern electronic engine control systems, comprehensive diagnosis and testing procedures fall outside the confines of this repair manual. For complete information on diagnosis, testing and repair procedures concerning all modern engine and emission control systems, please refer to "Chilton's Guide to Electronic Engine Controls".

Emission Warning Lamps

RESETTING

NOTE: The Emission Maintenance Warning (EMW) light system consists of an instrument panel mounted amber lens light that is electrically connected to a sensor module located under the instrument panel.

1. Turn the key switch to the **OFF** position.
2. Lightly push a tool through the 0.2 in. diameter hole with the sticker

labeled "RESET" and press down and hold.

3. While pressing the tool, turn the keyswitch to the **RUN** position. The Emission Maintenance Warning (EMW) lamp will then light and remain lit for as long as the tool is pressed down.

4. Hold the tool down for 5 seconds. Remove the tool. The lamp should go out within 2 to 5 seconds indicating a reset has occurred.

5. Turn the keyswitch to the **OFF** position then turn the keyswitch to the **RUN** position. The EMW lamp will light for 2-5 seconds and will then go out. This verifies that a proper reset of the module has been accomplished.

GASOLINE ENGINE MECHANICAL

Engine

REMOVAL & INSTALLATION

Bronco and F Series

4.9L ENGINE

NOTE: On fuel injected vehicles always relieve the fuel pressure before starting this repair. Always mark all vacuum lines, electrical connection wires and hoses for correct installation.

1. Drain the cooling system and the crankcase. Remove (mark the hood hinges for correct installation) the

hood and the air cleaner. Disconnect the negative battery cable.

2. Disconnect the heater hose from the water pump and coolant outlet housing.

3. Disconnect the flexible fuel line from the fuel pump. Remove the throttle body inlet tubes if so equipped.

4. Evacuate the air conditioning system. Remove the air conditioner compressor and the condenser.

5. Remove the radiator. Remove the fan, water pump pulley and fan belt.

6. Disconnect the accelerator cable at the carburetor or throttle body. Remove the throttle return spring.

7. On vehicles equipped with power brakes, disconnect the brake booster vacuum hose at the intake manifold. On vehicles with automatic transmission, disconnect the transmission kickdown rod at the bellcrank assembly or the cable at the throttle body.

8. Disconnect the exhaust pipe from the exhaust manifold. Disconnect the body ground strap and the battery ground cable from the engine. Disconnect the Electronic Engine Control (EEC) harness from all sensors if so equipped.

9. Disconnect the engine wiring harness at the ignition coil, the coolant temperature sending unit and the oil pressure sending unit. Position the wiring harness out of the way.

10. Remove the alternator mounting bolts and position the alternator out of the way.

11. On a vehicle equipped with power steering, remove the power steering pump from the mounting brackets and move it to one side, leaving the lines attached.

12. Raise and safely support the vehicle.

13. Remove the starter and automatic transmission filler tube bracket, if so equipped. Also, remove the rear en-

gine plate upper right bolt.

14. On manual transmission equipped vehicles, remove the flywheel housing lower attaching bolts and disconnect the clutch return spring.

15. On automatic transmission equipped vehicles, remove the converter housing access cover assembly and remove the flywheel-to-converter attaching nuts. Secure the converter in the housing. Remove the transmission oil cooler lines from the retaining clip at the engine. Remove the lower converter housing-to-engine attaching bolts.

16. Remove the nut from each of the 2 front engine mounts.

17. Lower the vehicle and position a jack under the transmission and support it. Remove the remaining bellhousing-to-engine attaching bolts.

18. Attach the engine lifting device and raise the engine slightly and carefully pull it from the transmission. Lift the engine out of the vehicle.

19. Installation is the reverse of the removal procedure.

20. Torque all bolts to specifications. Fill the cooling system. Fill the crankcase.

21. Start the engine and check for leaks. Bleed the cooling system. Adjust the clutch pedal free-play or the automatic transmission control linkage.

5.0L AND 5.8L ENGINES

NOTE: On fuel injected vehicles always relieve the fuel pressure before starting this repair. Always mark all vacuum lines, electrical connection wires and hoses for correct installation.

1. Drain the cooling system and crankcase. Remove (mark the hinges for correct installation) the hood.

2. Disconnect the battery cable first and alternator cables from the cylinder block.

3. Remove the air cleaner and intake duct assembly, plus the crankcase ventilation hose.

4. Disconnect the upper and lower radiator hoses and if so equipped, the automatic transmission oil cooler lines.

5. Discharge the A/C system and remove the condenser.

6. Remove the fan shroud and lay it over the fan. Remove the radiator and fan, shroud, fan spacer, pulley and belt.

7. Disconnect the alternator leads and the alternator adjusting bolts. Allow the alternator to swing down out of the way.

8. Disconnect the oil pressure sending unit lead from the sending unit.

9. Disconnect the fuel tank-to-pump fuel line at the fuel pump and

plug the line. For EFI, disconnect the chassis fuel line quick disconnects at the fuel rails.

10. Disconnect the accelerator linkage. Disconnect the speed control linkages. Disconnect the automatic transmission kickdown rod and remove the return spring, if so equipped.

11. Disconnect the power brake booster vacuum hose.

12. For EFI, after disconnecting the accelerator and the TV cable from the throttle body, disconnect the throttle bracket from the upper intake manifold and swing out of the way with the cables still attached to the bracket.

13. Disconnect the heater hoses from the water pump and intake manifold. Disconnect the temperature sending unit wire from the sending unit.

14. Remove the upper bellhousing-to-engine attaching bolts.

15. Disconnect the primary wire from the coil. Remove the wiring harness from the left rocker arm cover and position the wires out of the way. Disconnect the ground strap from the cylinder block.

16. Raise and safely support the vehicle and disconnect the starter cable from the starter. Remove the starter.

17. Disconnect the exhaust pipe from the exhaust manifolds.

18. Disconnect the engine mounts from the brackets on the frame.

19. On vehicles with automatic transmission, remove the converter inspection plate and remove the torque converter-to-flywheel attaching bolts.

20. Remove the remaining bellhousing-to-engine attaching bolts.

21. Lower the vehicle and support the transmission with a jack.

22. Install an engine lifting device.

23. Raise the engine slightly and carefully pull it out from the transmission. Lift the engine out of the engine compartment.

24. Install the engine in the reverse order of removal procedure. Make sure that the dowels in the engine block engage the holes in the bellhousing through the rear cover plate.

25. Torque all bolts to specifications. Fill the cooling system. Fill the crankcase.

26. Start the engine and check for leaks. Bleed the cooling system. Adjust the clutch pedal free-play or the automatic transmission control linkage as necessary.

7.5L ENGINE

NOTE: On fuel injected vehicles always relieve the fuel pressure before starting this repair. Always mark all vacuum lines, electrical connection wires and hoses for correct installation.

1. Mark the hood hinges for correct installation then remove the hood.

2. Drain the cooling system and the cylinder block. Drain the engine oil.

3. Disconnect the negative battery cable and remove the air cleaner assembly.

4. Disconnect the upper and lower radiator hoses and the transmission oil cooler lines from the radiator.

5. Remove the fan shroud from the radiator and remove the fan from the water pump. Remove the fan and shroud from the engine compartment.

6. Remove the upper support and remove the radiator.

7. If the vehicle is equipped with air conditioning, remove the compressor from the engine and position it out of the way. If the compressor must be removed completely, loosen the air conditioning service valves (disconnect) carefully to discharge the air conditioning system. Remove the compressor.

8. Remove the power steering pump from the engine, if so equipped and position it to one side. Do not disconnect the fluid lines.

9. Disconnect the fuel pump inlet line from the pump and plug the line.

10. Remove the alternator drive belts and disconnect the alternator from the engine, positioning it aside.

11. Disconnect the ground cable from the right front corner of the engine.

12. Disconnect the heater hoses.

13. Remove the transmission fluid filler tube attaching bolt from the right-side valve cover and position the tube out of the way.

14. Disconnect all vacuum lines at the rear of the intake manifold.

15. Disconnect the speed control cable at the carburetor, if so equipped. Disconnect the accelerator rod and the transmission kickdown rod and secure them out of the way.

16. Disconnect the engine wiring harness at the connector on the fire wall.

17. Raise and support the vehicle safely. Disconnect the exhaust pipes at the exhaust manifolds.

18. Disconnect the starter cable and remove the starter. Bring the starter forward and rotate the solenoid outward to remove the assembly.

19. Remove the access cover from the converter housing and remove the flywheel-to-converter attaching nuts. Remove the lower converter housing-to-engine attaching bolts.

20. Remove the engine mount through-bolts attaching the rubber insulators to the frame brackets.

21. Lower the vehicle and place a jack under the transmission to support it.

22. Remove the converter housing-

to-engine block attaching bolts (left-side).

23. Disconnect the coil wire and remove the coil and bracket assembly from the intake manifold.

24. Attach the engine lifting device and carefully lift the engine from the engine compartment.

25. Install the engine in the reverse order of removal procedure.

26. Torque all bolts to specifications. Fill the cooling system. Fill the crankcase.

27. Start the engine and check for leaks. Bleed the cooling system. Adjust the clutch pedal free-play or the automatic transmission control linkage as necessary.

E Series

4.9L ENGINE

NOTE: On fuel injected vehicles always relieve the fuel pressure before starting this repair. Always mark all vacuum lines, electrical connection wires and hoses for correct installation.

1. Take off the engine cover (dog-house cover), drain the coolant, remove the air cleaner and disconnect the battery.

2. Remove the bumper, grille and gravel deflector.

3. Remove the upper radiator hose at the engine. Remove the alternator splash shield and detach the lower hose at the radiator. Remove the radiator and shroud, if equipped.

4. Disconnect the engine heater hoses and the alternator wires. Remove the power steering pump and support. If vehicle is equipped with air conditioning, discharge the system and remove the air conditioning compressor.

5. Disconnect and plug the fuel line at the pump.

6. Disconnect the Electronic Engine Control (EEC) harness from all sensors, if so equipped.

7. Detach from the engine: distributor and gauge sending unit wires, brake booster hose, accelerator cable and bracket.

8. Disconnect the automatic transmission kickdown linkage at the bellcrank. With fuel injection, disconnect the cable at the throttle body.

9. Remove the exhaust manifold heat deflector and unbolt the pipe from the manifold.

10. Disconnect the automatic transmission vacuum line from the intake manifold and from the junction. Remove the transmission dipstick tube support bolt at the intake manifold.

11. Raise and safely support the vehicle. Remove the upper engine-to-transmission bolts.

12. Remove the starter. Remove the flywheel inspection cover. Remove the automatic transmission torque converter retaining nuts, then remove the front engine support nuts. Drain the engine oil and remove the oil filter.

13. Remove the rest of the transmission-to-engine fasteners, then lift the engine out from the engine compartment with a floor crane.

14. Installation is the reverse of the removal procedure.

15. Check all fluid levels. Start the engine and check for leaks. Bleed the cooling system. Adjust the clutch pedal free-play or the automatic transmission control linkage as necessary.

5.0L, 5.8L AND 7.5L ENGINES

NOTE: On fuel injected vehicles always relieve the fuel pressure before starting this repair. Always mark all vacuum lines, electrical connection wires and hoses for correct installation.

1. Take off the engine cover (dog-house cover), drain the coolant, remove the air cleaner and disconnect the battery. Remove the bumper, grille and gravel deflector. Remove the upper grille support bracket, hood lock support and air conditioning condenser upper mounting brackets.

2. With air conditioning, the system must be discharged to remove the condenser. Disconnect the lines at the compressor.

3. Remove the accelerator cable bracket and the heater hoses. Detach the radiator hoses and the automatic transmission shift rod.

7. Disconnect the fuel and choke lines, detach the vacuum lines and remove the carburetor and spacer on vehicles so equipped.

8. Raise the vehicle and safely support as necessary. Drain oil and remove the oil filter. Remove the fan shroud, fan and radiator.

4. Pivot the alternator in and detach the wires.

5. Remove the air cleaner, duct and valve, exhaust manifold shroud and flex tube.

6. Disconnect the automatic filter. Detach the exhaust pipe from the manifold. Unbolt the automatic transmission tube bracket from the cylinder head. Remove the starter.

9. Remove the engine mount bolts. With automatic, remove the converter inspection cover and unbolt the converter from the flex plate.

10. Unbolt the engine ground cable and support the transmission.

11. Remove the power steering front bracket. Detach only one vacuum line at the rear of the intake manifold. Disconnect the engine wiring loom. Re-

move the speed control servo from the manifold. Detach the compressor clutch wire.

12. Install a lifting bracket and attach a floor crane. Remove the transmission-to-engine bolts, making sure the transmission is supported. Remove the engine.

13. Installation is the reverse of the removal procedure.

14. Check all fluid levels. Start the engine and check for leaks. Bleed the cooling system. Adjust the clutch pedal free-play or the automatic transmission control linkage as necessary.

Cylinder Head

REMOVAL & INSTALLATION

4.9L Engine

1. Drain the cooling system. Remove the air cleaner. Remove the oil filler tube. Disconnect the negative battery cable.

2. Relieve fuel pressure and throttle body inlet tubes if so equipped. Disconnect the muffler inlet pipe at the exhaust manifold. Pull the muffler inlet pipe down. Remove the gasket.

3. Disconnect the accelerator rod or

Cylinder head bolts tightening sequence
4.9L engine

cable retracting spring. Disconnect the choke control cable and the accelerator rod at the carburetor if so equipped.

4. Disconnect the transmission kickdown rod. Disconnect the accelerator linkage at the bellcrank assembly.

5. Disconnect the fuel inlet line at the fuel filter hose and the distributor vacuum line at the carburetor if so equipped. Disconnect other vacuum lines as necessary for accessibility and identify them for proper connection.

6. Remove the radiator upper hose at the coolant outlet housing.

7. Disconnect the distributor vacuum line at the distributor. Disconnect the carburetor if so equipped fuel inlet line at the fuel pump. Remove the lines as an assembly.

8. Disconnect the spark plug wires at the spark plugs and the temperature sending unit wire at the sending unit.

9. Grasp the PCV vent hose near the PCV valve and pull the valve out of the grommet in the valve rocker arm cover. Disconnect the PCV vent hose

at the hose fitting in the intake manifold spacer and remove the vent hose and PCV valve.

10. Disconnect the carburetor if so equipped air vent tube and remove the valve rocker arm cover.

11. Remove the valve rocker arm shaft assembly. Remove the pushrods in sequence so that they can be identified and reinstalled in their original positions.

12. Remove the cylinder head bolts and remove the cylinder head. Do not pry between the cylinder head and the block as the gasket surfaces may be damaged.

13. Installation is the reverse of the removal procedure. Coat the threads of the cylinder head bolts with engine oil. Tighten the bolts in numerical sequence and tighten in 3 steps. The 1st step 50–55 ft. lbs., 2nd step 60–65 ft. lbs. and 3rd step 70–85 ft. lbs. It is not necessary to retorque cylinder head bolts after extended operation.

5.0L and 5.8L Engines

1. Disconnect the negative battery cable. Drain the cooling system. Remove the intake manifold and carburetor as an assembly. On fuel injected vehicles relieve fuel pressure and remove intake manifold and throttle body as assembly.

2. Remove rocker arm cover.

3. To remove right cylinder head, loosen alternator adjusting arm bolt and remove the alternator mounting bracket bolt and spacer. Swing alternator down out of the way. On some vehicles it may be necessary to remove the coil and air cleaner inlet duct from the right head. To remove left cylinder head, remove accelerator shaft fastening bolts at the front of the head. On some later models, it may be necessary to remove the air conditioning compressor bracket.

4. Raise and safely support the vehicle. Disconnect exhaust pipe from the manifold.

5. Loosen rocker arm stud nuts and twist rocker arms so that the pushrods may be removed. Identify the pushrods when removing so that they may be reinstalled in their original locations.

6. Remove the cylinder head retaining bolts and remove the assembly from the vehicle.

To install:

7. Clean all gasket surfaces of block, head and rocker cover. Position new head gasket over the dowels onto the block (do use sealer on this composition gasket). Install the cylinder head on the engine block.

8. On 5.0L engine, install head bolts and tighten in 2 steps. The 1st step 55–65 ft. lbs. and the 2nd step 65–72 ft.

Cylinder head bolt tightening sequence—5.0L, 5.8L and 7.5L engines

lbs. On 5.8L engine, install head bolts and tighten in 3 steps. The 1st step 85 ft. lbs., 2nd step 95 ft. lbs. and 3rd step 105–112 ft. lbs. It is not necessary to retorque cylinder head bolts after extended operation.

9. Clean pushrods, blowing out oil passage and check them for straightness. Lubricate pushrod ends, valve stem tips and rocker arm cups, fulcrum sets and followers. Install pushrods in their original locations.

10. Connect the exhaust pipe to the manifold, using new gasket and torque nuts to 25–38 ft. lbs.

11. On right cylinder head, position the alternator and install the attaching bolt and spacer, ignition coil and air cleaner inlet duct. Adjust drive belt tension. On left cylinder head, install accelerator shaft assembly and air conditioning compressor bracket.

12. Install rocker cover using new gasket and tightening cover bolts to 3–5 ft. lbs.

13. Install intake manifold/carburetor assembly or intake manifold/throttle body as assembly.

14. Install the thermactor air supply assembly where necessary. Check all fluid levels and road test the vehicle for proper operation.

7.5L ENGINE

1. Disconnect the negative battery cable. Drain the cooling system. Remove the intake manifold and carburetor as an assembly. On fuel injected vehicles relieve fuel pressure and remove intake manifold and throttle body as assembly.

2. Raise and safely support the vehicle as necessary. Disconnect the exhaust pipe from the exhaust manifold. Some applications may require the removal of the exhaust manifold at the cylinder heads.

3. Loosen the air conditioning compressor drive belt, if so equipped.

4. Loosen the alternator attaching bolts and remove the bolt attaching the alternator bracket to the right cylinder head.

5. Disconnect the air conditioning compressor from the engine and move it aside, out of the way. Do not discharge the air conditioning system, if possible.

6. Remove the bolts securing the

power steering reservoir bracket to the left cylinder head. Position the reservoir and bracket out of the way. Remove air brake and thermactor brackets as necessary.

7. Remove the valve rocker arm covers. Remove the rocker arm bolts, rocker arms, oil deflectors, fulcrums and pushrods in sequence so that they can be reinstalled in their original positions.

8. Remove the cylinder head bolts and lift the head and exhaust manifold off the engine. If necessary, pry at the forward corners of the cylinder head against the casting bosses provided on the cylinder block. Do not damage the gasket mating surfaces of the cylinder head and block by prying against them.

9. Remove all gasket material from the cylinder head and block. Clean all gasket material from the mating surfaces of the intake manifold. If the exhaust manifold was removed, clean the mating surfaces of the cylinder head exhaust port areas and install the exhaust manifold.

10. Position the 2 long cylinder head bolts in the 2 rear lower bolt holes of the left cylinder head. Place a long cylinder head bolt in the rear lower bolt hole of the right cylinder head. Use rubber bands to keep the bolts in position until the cylinder heads are installed on the cylinder block.

11. Position new cylinder head gaskets on the cylinder block dowels. Do not apply sealer to the gaskets, heads, or block.

12. Place the cylinder heads on the block, guiding the exhaust pipe connections. Install the remaining cylinder head bolts. The longer bolts go in the lower row of holes.

13. Tighten all the cylinder head attaching bolts in the proper sequence in 3 steps. The 1st step 80–90 ft. lbs., 2nd step 100–110 ft. lbs. and 3rd step 130–140 ft. lbs. It is not necessary to retorque cylinder head bolts after extended operation.

Valve Lash

ADJUSTMENT

4.9L Engine

A 0.060 in. shorter or longer pushrod is available for service to provide a means of adjustment in the valve mechanism. Use the following service procedure to determine whether a shorter or longer pushrod is necessary.

1. Install an auxiliary starter switch or equivalent.

2. Make 2 marks on the crankshaft damper. Space the marks 120 degrees apart so that with timing mark the damper is divided into 3 equal parts.

3. With No. 1 piston on TDC at the end of the compression stroke, tighten the rocker arm bolts of the No. 1 intake and exhaust valve to 17-23 ft. lbs.

4. Slowly apply pressure to bleed down the tappet until the plunger is completely bottomed. Hold the tappet in this position and check the available clearance between the rocker arm and the valve stem tip with a feeler gauge.

5. Repeat this procedure for the rest of the valves, turning the crankshaft one-third turn at a time in the direction of rotation. Adjust the valves in the firing order sequence 1-5-3-6-2-4.

5.0L Engine

NOTE: A 0.060 in. shorter or longer pushrod is available for service to provide a means of adjustment in the valve mechanism.

1. Install an auxiliary starter switch. Crank the engine with the ignition switch **OFF** until No. 1 piston is on TDC after the compression stroke.

2. With the crankshaft in the positions designated in Steps 5, 6 and 7, position a hydraulic tappet compressor tool or equivalent on the rocker arm.

3. Slowly apply pressure to bleed down the hydraulic tappet until the plunger is completely bottomed. Hold the tappet in this position and check the available clearance between the

rocker arm and the valve stem tip with a feeler gauge.

4. If the clearance is less than specification (0.060 in.), install a shorter pushrod. If clearance is greater than specification (0.060 in.), install a longer pushrod.

5. With the No. 1 piston on TDC at the end of the compression stroke, Position 1 on the crankshaft pulley, check the following valves:

- No. 1 intake
- No. 1 exhaust
- No. 7 intake
- No. 5 exhaust
- No. 8 intake
- No. 4 exhaust

6. After these valves have been checked, rotate the crankshaft to Position 2 and check the following valves:

- No. 5 intake
- No. 2 exhaust
- No. 4 intake
- No. 6 exhaust

7. After these valves have been checked, rotate the crankshaft to Position 3 and check the following valves:

- No. 2 intake
- No. 7 exhaust
- No. 3 intake
- No. 3 exhaust
- No. 6 intake
- No. 8 exhaust

5.8L Engine

NOTE: A 0.060 in. shorter or longer pushrod is available for service to provide a means of adjustment in the valve mechanism.

1. Disconnect the brown lead (I terminal) and the red and blue leads (S terminal) at the starter relay. Install an auxiliary starter switch between the battery and the S terminals of the starter relay. Crank the engine with the ignition switch **OFF** until No. 1 piston is on TDC after the compression stroke.

2. With the crankshaft in the positions designated in Steps 5, 6 and 7, position a hydraulic tappet compressor tool or equivalent on the rocker arm.

3. Slowly apply pressure to bleed down the hydraulic tappet until the plunger is completely bottomed. Hold the tappet in this position and check the available clearance between the rocker arm and the valve stem tip with a feeler gauge.

4. If the clearance is less than specification (0.060 in.), install a shorter pushrod. If clearance is greater than specification (0.060 in.), install a longer pushrod.

5. With the No. 1 piston on TDC at the end of the compression stroke, Position 1 on the crankshaft pulley, check the following valves:

- No. 1 intake

STEP 1 - SET NO. 1 PISTON ON T.D.C. AT END OF COMPRESSION STROKE ADJUST NO. 1 INTAKE AND EXHAUST

STEP 4 - CHECK NO. 6 INTAKE AND EXHAUST

STEP 2 - CHECK NO. 5 INTAKE AND EXHAUST
STEP 5 - CHECK NO. 2 INTAKE AND EXHAUST

STEP 3 - CHECK NO. 3 INTAKE AND EXHAUST
STEP 6 - CHECK NO. 4 INTAKE AND EXHAUST

4.9L engine—valve clearance adjustment

TAPPET BLEED DOWN WRENCH

Checking valve clearance

ROTATE THE CRANKSHAFT 180 DEGREES (ONE HALF REVOLUTION) CLOCKWISE FROM POSITION 1

POSITION 3—
ROTATE THE CRANKSHAFT 270 DEGREES (THREE QUARTER REVOLUTION) CLOCKWISE FROM POSITION 2

5.0L and 5.8L engines—valve clearance adjustment

- No. 1 exhaust
- No. 4 intake
- No. 3 exhaust
- No. 8 intake
- No. 7 exhaust

6. After these valves have been checked, rotate the crankshaft to Position 2 and check the following valves:

- No. 3 intake
- No. 2 exhaust
- No. 7 intake
- No. 6 exhaust

7. After these valves have been checked, rotate the crankshaft to Position 3 and check the following valves:

- No. 2 intake
- No. 4 exhaust
- No. 5 intake
- No. 5 exhaust
- No. 6 intake
- No. 8 exhaust

7.5L Engine

NOTE: A 0.060 in. shorter or longer pushrod is available for service to provide a means of adjustment in the valve mechanism.

1. Install an auxiliary starter switch. Crank the engine with the ignition switch **OFF** until No. 1 piston is on TDC after the compression stroke.

2. With the crankshaft in the positions designated in Steps 5 and 6, position a hydraulic tappet compressor tool or equivalent on the rocker arm.

3. Slowly apply pressure to bleed down the hydraulic tappet until the

plunger is completely bottomed. Hold the tappet in this position and check the available clearance between the rocker arm and the valve stem tip with a feeler gauge.

4. If the clearance is less than specification (0.060 in.), install a shorter pushrod. If clearance is greater than specification (0.060 in.), install a longer pushrod.

5. With the No. 1 piston on TDC at the end of the compression stroke, Position 1 on the crankshaft pulley, check the following valves:

- No. 1 intake
- No. 1 exhaust
- No. 3 intake
- No. 4 exhaust
- No. 7 intake
- No. 5 exhaust
- No. 8 intake
- No. 8 exhaust

6. After these valves have been checked, rotate the crankshaft 360 degrees to Position 2 and check the following valves:

- No. 2 intake
- No. 2 exhaust
- No. 4 intake
- No. 3 exhaust
- No. 5 intake
- No. 6 exhaust
- No. 6 intake
- No. 7 exhaust

Rocker Arms/Shaft

REMOVAL & INSTALLATION

4.9L Engine

1. Disconnect the negative battery cable. Remove the inlet air hose at the oil fill cap and air cleaner. On fuel injected engines remove the inlet air

hose and throttle body inlet tubes.

2. Disconnect the accelerator cable at the carburetor or throttle body. Remove the cable retracting spring. Remove the accelerator cable bracket from the cylinder head and position the cable and bracket assembly out of the way.

3. On fuel injected engines relieve the fuel pressure and remove the fuel line from the fuel rail. Remove the upper intake and throttle body assembly.

4. Remove the PCV valve from the valve rocker arm cover. Remove the cover bolts and remove the valve rocker arm cover.

5. Remove (keep all parts in order for correct installation) the valve rocker arm stud nut, fulcrum seat and rocker arm.

6. Installation is the reverse of the removal procedure. Adjust the valve clearance as required. Tighten the valve cover retaining bolts starting in the middle and working toward the ends to 4–7 ft. lbs.

5.0L, 5.8L and 7.5L Engines

1. Disconnect the negative battery cable. Remove air cleaner and intake duct assembly.

2. Remove crankcase ventilation hose from rocker cover. Remove the coil and the solenoid brackets.

3. For removal of the right side rocker cover, remove the lifting eye and the thermactor tube.

4. Remove the oil filler pipe hose from the left side rocker arm cover, if so equipped.

5. Disconnect spark plug leads and remove leads from bracket on the valve rocker cover.

6. Remove the vacuum harness and

POSITION 1—NO. 1 AT TDC AT END OF COMPRESSION STROKE.
POSITION 2—ROTATE THE CRANKSHAFT 360 DEGREES (ONE REVOLUTION) CLOCKWISE FROM POSITION 1.

7.5L engine—valve clearance adjustment

Rocker arm assembly

the electrical connectors to the vacuum solenoids mounted on the rocker arm covers and position out of the way.

7. Disconnect the choke tubes at the carburetor if so equipped and position out of the way.

8. Disconnect the evaporative system hoses from the canister and position out of the way.

9. Remove the thermactor air supply hose.

10. Remove the rocker cover bolts and remove the covers.

11. Remove the valve rocker arm bolt, fulcrum seat and rocker arm.

12. For installation, reverse the removal procedure. Install the fulcrum guide, valve rocker arm, fulcrum seat and bolt. Tighten the rocker arm bolts to 18-25 ft. lbs. and the valve cover retaining bolts to 10 ft. lbs. Adjust the valve clearance as required.

Intake Manifold

REMOVAL & INSTALLATION

Fuel Injected Engines

5.0L AND 5.8L ENGINES

1. To remove the upper manifold: Disconnect the negative battery cable and relieve fuel pressure. Remove the air cleaner. Disconnect the electrical connectors at the air bypass valve, throttle position sensor and EGR position sensor.

2. Disconnect the throttle linkage at the throttle ball and the transmission linkage from the throttle body. Remove the bolts that secure the bracket to the intake and position the bracket and cables out of the way.

3. Disconnect the upper manifold vacuum fitting connections by removing all the vacuum lines at the vacuum tree (label lines for position identification). Remove the vacuum lines to the EGR valve and fuel pressure

Upper Intake manifold assembly-5.0L and 5.8L engines

Lower intake manifold assembly-5.0L and 5.8L engines

Lower manifold installation torque sequence—5.0L and 5.8L engines

regulator.

4. Disconnect the PCV system by disconnecting the hose from the fitting at the rear of the upper manifold.

5. Remove the 2 canister purge lines from the fittings at the throttle body.

6. Disconnect the EGR tube from the EGR valve by loosening the flange nut.

7. Remove the bolt from the upper intake support bracket to upper manifold. Remove the upper manifold retaining bolts and remove the upper intake manifold and throttle body as an assembly.

8. Position a new mounting gasket on the lower intake manifold and install the upper manifold in the reverse order of removal. Tighten the upper manifold retaining bolts to 12-18 ft. lbs.

9. To remove the lower intake man-

ifold: Upper manifold and throttle body must be removed first.

10. Disconnect the negative battery cable. Drain the cooling system.

11. Remove the distributor assembly, cap and wires.

12. Disconnect the electrical connectors at the engine coolant temperature sensor and sending unit, at the air charge temperature sensor and at the knock sensor.

13. Disconnect the injector wiring harness from the main harness assembly. Remove the ground wire from the intake manifold stud. The ground wire must be installed at the same position it was removed from.

14. Relieve the fuel pressure. Disconnect the fuel supply and return lines from the fuel rails.

15. Remove the upper radiator hose from the thermostat housing. Remove the bypass hose. Remove the heater outlet hose at the intake manifold.

16. Remove the air cleaner mounting bracket. Remove the intake manifold mounting bolts and studs. Pay attention to the location of the bolts and studs for reinstallation. Remove the lower intake manifold assembly.

17. Installation is the reverse of the removal procedure. Tighten the upper manifold retaining bolts to 12-18 ft. lbs. and lower manifold retaining bolts in sequence to 22-32 ft. lbs.

7.5L ENGINE

1. Disconnect the battery cable. Drain the cooling system and remove the air cleaner assembly.

2. Disconnect the upper radiator hose at the engine.

3. Disconnect the heater hoses at the intake manifold and the water pump. Position them out of the way. Loosen the water pump bypass hose clamp at the intake manifold.

4. Disconnect the PCV valve and hose at right valve cover. Disconnect all of the vacuum lines at the rear of the intake manifold and tag them for proper reinstallation.

5. Disconnect the wires at the spark plugs and remove the wires from the brackets on the valve covers. Disconnect the high-tension wire from the coil and remove the distributor cap and wires as an assembly.

6. Remove the distributor.

7. Disconnect the accelerator linkage at the throttle body. Remove the speed control linkage bracket, if so equipped, from the manifold and throttle body.

8. Remove the bolts holding the accelerator linkage bellcrank and position the linkage and return springs out of the way.

9. Relieve the fuel pressure. Disconnect the fuel line at the fuel rail.

10. Disconnect the wiring harness from the main wiring harness. Remove lower intake manifold and wiring as an assembly.

11. Remove the throttle body heater hose. Remove the intake manifold attaching bolts and lift the manifold and throttle body from the engine as an assembly. It may be necessary to pry the manifold away from the cylinder heads. Do not damage the gasket sealing surfaces.

12. Install the manifold and related equipment in reverse order of removal. Tighten the upper manifold (if removed) retaining bolts to 12-18 ft. lbs. Using 3 steps, torque the lower intake manifold retaining nuts and bolts in sequence to 22-35 ft. lbs.

Carbureted Engines

5.0L AND 5.8L ENGINES

1. Disconnect the negative battery

Intake manifold torque sequence—7.5L engine

Intake manifold assembly—7.5L engine

cable. Drain the cooling system. Remove the air cleaner and the intake duct assembly.

2. Disconnect the accelerator rod from the carburetor and remove the accelerator retracting spring. Disconnect the automatic transmission kick-down rod at the carburetor, if so equipped.

3. Disconnect the high tension lead and all other wires from the ignition coil.

4. Disconnect the spark plug wires from the spark plugs by grasping the rubber boots and twisting and pulling at the same time. Remove the wires from the brackets on the rocker covers. Remove the distributor cap and spark plug wire assembly.

5. Remove the carburetor fuel inlet line and the distributor vacuum line from the carburetor.

6. Remove the distributor lock bolt and remove the distributor and vacuum line, as required.

7. Disconnect the upper radiator hose from the coolant outlet housing and the water temperature sending unit wire at the sending unit. Remove the heater hose from the intake manifold.

8. Loosen the clamp on the water pump bypass hose at the coolant outlet housing and slide the hose off the outlet housing.

9. Disconnect the PCV hose at the rocker cover.

10. If the engine is equipped with the thermactor exhaust emission control system, remove the air pump to cylinder head air hose at the air pump and position it out of the way. Also remove the air hose at the backfire suppressor valve. Remove the air hose bracket from the valve rocker arm cover and position the air hose out of the way. Remove the intake manifold retaining bolts.

11. Remove the intake manifold and carburetor as an assembly. It may be necessary to pry the intake manifold from the cylinder head. Remove all traces of the intake manifold to cylinder head gaskets and the 2 end seals from both the manifold and the other mating surfaces of the engine.

To install:

12. Clean the mating surfaces of the intake manifold, cylinder heads and block with laquer thinner or similar solvent. Apply a $\frac{1}{8}$ in. bead of silicone rubber RTV sealant in the correct location.

13. Install new seals on the block and press the seal locating extensions into the holes in the mating surfaces.

14. Apply a $\frac{1}{16}$ in. bead of sealer to the outer end of each manifold seal for the full length of the seal (4 places).

NOTE: This sealer sets in about 15 minutes, depending on brand, so work quickly but carefully. Do not drop any sealer into the manifold cavity. It will form, set and plug the oil gallery.

15. Position the manifold gasket onto the block and heads with the alignment notches under the dowels in the heads. Be sure gasket holes align with head holes.

16. Install the manifold and related equipment in reverse order of removal procedure. Torque the intake manifold retaining bolts in sequence to 23–25 ft. lbs. The torque sequence pattern is the same as the one used on the fuel injected engines.

7.5L ENGINE

1. Disconnect the battery cable. Drain the cooling system and remove the air cleaner assembly.

2. Disconnect the upper radiator hose at the engine.

3. Disconnect the heater hoses at the intake manifold and the water pump. Position them out of the way. Loosen the water pump by-pass hose clamp at the intake manifold.

4. Disconnect the PCV valve and hose at right valve cover. Disconnect all of the vacuum lines at the rear of the intake manifold and tag them for proper reinstallation.

5. Disconnect the wires at the spark plugs and remove the wires from the brackets on the valve covers. Disconnect the high-tension wire from the coil and remove the distributor cap and wires as an assembly.

6. Disconnect all of the distributor vacuum lines at the carburetor and vacuum control valve and tag them for proper installation. Remove the distributor and vacuum lines as an assembly.

7. Disconnect the accelerator linkage at the carburetor. Remove the speed control linkage bracket, if so equipped, from the manifold and carburetor.

8. Remove the bolts holding the accelerator linkage bellcrank and position the linkage and return springs out of the way.

9. Disconnect the fuel line at the carburetor.

10. Disconnect the wiring harness at the coil battery terminal, engine temperature sending unit, oil pressure sending unit and other connections as necessary. Disconnect the wiring harness from the clips at the left valve cover and position the harness out of the way.

11. Remove the coil and bracket assembly.

12. Remove the intake manifold at-

taching bolts and lift the manifold and carburetor from the engine as an assembly. It may be necessary to pry the manifold away from the cylinder heads. Do not damage the gasket sealing surfaces.

13. Install the manifold and related equipment in reverse order of removal. Using 3 steps, torque intake manifold retaining nuts and bolts in sequence to 22–35 ft. lbs.

Exhaust Manifold

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Remove the air cleaner and intake duct assembly.

2. Remove the air cleaner inlet duct retaining bolts on E series vehicles.

3. Raise and safely support the vehicle. Disconnect the muffler inlet pipes.

4. Remove the exhaust manifold heat shields. On the left side exhaust manifold remove oil dipstick tube assembly, speed control bracket and heat control valve.

5. Remove the exhaust manifold retaining bolts and remove the manifold from the vehicle.

6. Install the exhaust manifold in the reverse order of removal procedure. Tighten the attaching bolts to specifications, starting from the center and working to both ends alternately.

Combination Manifold

REMOVAL & INSTALLATION

4.9L Engine

1. Disconnect the negative battery cable. Remove the air cleaner and on fuel injected engines remove the throttle body air inlet hoses. Disconnect the choke cable at the carburetor if so equipped.

2. Disconnect the accelerator cable or rod at the carburetor or throttle body. Remove the accelerator retracting spring. Remove bracket and position it out of the way.

3. On a vehicle with automatic transmission, remove the kickdown rod retracting spring. Remove the accelerator rod bellcrank assembly.

4. Disconnect the fuel inlet line and the distributor vacuum line from the carburetor.

5. On fuel injected vehicles relieve the fuel pressure and remove the fuel line from the fuel rail. Disconnect all vacuum lines and remove the upper intake manifold and throttle body as an assembly.

6. Disconnect the muffler inlet pipe from the exhaust manifold.

Combination manifold torque sequence—4.9L engine

7. Disconnect the power brake vacuum line, if so equipped.

8. Remove the bolts and nuts attaching the manifolds to the cylinder head. Lift the manifold assemblies from the engine. Remove and discard the gaskets.

9. To separate the manifolds, remove the nuts joining the intake and exhaust manifolds.

10. Installation is the reverse of the removal procedure. Place the manifold assembly in position against the cylinder head. Make sure that the new gaskets have not become dislodged. Install the attaching washers, bolts and nuts. Tighten the attaching nuts and bolts in the proper sequence to 22–32 ft. lbs.

Timing Chain Front Cover

REMOVAL & INSTALLATION

NOTE: On E series vehicles raise and safely support the vehicle to aid in this service repair. On all vehicles, it may be necessary to remove the complete oil pan assembly to gain clearance to remove front cover.

1. Disconnect the negative battery cable. Drain the cooling system.

2. Remove all necessary hoses and vacuum lines. Remove the shroud and radiator.

3. Remove the drive belt(s), power steering bracket, fan and pulleys.

4. Remove the screw and washer from the end of the crankshaft and remove the vibration damper using a suitable tool.

5. Remove the oil pan (loosen the first 6 bolts on each side and push down) and front cover attaching bolts. Remove the front cover.

6. Installation is the reverse of the removal procedure. Tighten oil pan retaining bolts to 10–15 ft. lbs. and front cover retaining bolts 12–18 ft. lbs.

Front Cover Oil Seal

REMOVAL & INSTALLATION

NOTE: On E series vehicles raise and safely support the vehicle to aid in this service repair.

1. Disconnect the negative battery cable.

2. Remove the fan clutch assembly and the shroud.

3. Loosen the accessory drive belts.

4. Remove the crankshaft pulley.

5. Remove the crankshaft damper using a suitable tool.

6. Pry the seal from the front cover using care to prevent damage to front cover and the crankshaft.

7. Installation is the reverse of the removal procedure. Lubricate the seal lip with clean engine oil before install-

CRANKSHAFT DAMPER REMOVER D80L-522-A

Removing crankshaft damper

ing. Tighten the crankshaft pulley bolt to specifications.

Timing Chain and Gears

REMOVAL & INSTALLATION

Bronco and F Series

4.9L ENGINE

1. Disconnect the negative battery cable.

2. Drain the cooling system.

3. Remove the front cover assembly.

4. Crank the engine until the timing marks are in the correct position.

5. Install a camshaft gear puller or equivalent and remove the camshaft and crankshaft gears.

6. Installation is the reverse of the removal procedure. Make sure that the camshaft gear key spacer and thrust plate are properly installed and timing marks are in the correct position. Drain the crankcase and replace the oil filter. Refill all fluid levels.

Timing mark alignment—4.9L engine

5.0L AND 5.8L ENGINES

1. Bring the engine to No. 1 cylinder at TDC (top dead center) on the compression stroke. Disconnect the negative battery cable. Drain the cooling system.

2. Remove the fan shroud to radiator attaching bolts. Position the shroud over the fan.

3. Disconnect the radiator lower hose, heater hose and bypass hose at the water pump. Remove the drive belt(s), fan, fan spacer and pulley.

4. Remove the fan shroud.

5. Loosen the alternator pivot bolt and bolt attaching the alternator adjusting arm to the water pump.

6. Remove the crankshaft pulley from the crankshaft vibration damper.

Remove the damper attaching bolt and washer. Install a puller or equivalent on the vibration damper and remove the damper.

7. Relieve fuel system pressure. Disconnect the fuel pump outlet line from the fuel pump. Remove the fuel pump to one side with the flexible fuel line still attached on vehicles equipped with a carburetor.

8. Remove the oil dipstick and the bolt attaching the dipstick to the exhaust manifold as required.

9. Remove the oil pan to cylinder front cover attaching bolts. Cut the oil pan gasket flush with the cylinder block face prior to separating the cover from the cylinder block. Remove the cylinder front cover and water pump as an assembly.

10. Discard the cylinder front cover gasket. Remove the crankshaft front oil slinger.

11. Ensure that the timing marks on the sprockets are correctly aligned.

12. Remove the camshaft sprocket capscrew, washers and fuel pump eccentric. Slide both sprockets and the timing chain forward and remove the chain and sprockets as an assembly.

13. Position the sprockets and timing chain on the camshaft. Be sure that the timing marks are properly aligned.

14. Install the fuel pump, eccentric, washers and camshaft sprocket capscrew. Tighten the capscrew to 40–45 ft. lbs.

15. Install the crankshaft front oil slinger.

16. Clean the cylinder front cover, oil pan and block gasket surfaces. Clean the oil pan gasket surface where the oil pan and front cover fasten.

17. Install a new crankshaft front oil seal.

18. Lubricate the timing chain and fuel pump eccentric with a heavy engine oil.

19. Coat the gasket surface of the oil pan with sealer, then cut and position the required sections of a new gasket on the oil pan and apply sealer at the corners. Install the pan seal as required. Coat the gasket surfaces of the block and cover with sealer and position a new gasket on the block.

20. Position the cylinder front cover (with new front oil seal installed) on the cylinder block. Use care when installing the cover to avoid seal damage or possible gasket dislocation.

21. Install the cylinder front cover. It may be necessary to force the cover downward to slightly compress the pan gasket. This operation can be facilitated by using a suitable tool at the front cover attaching hole locations.

22. Coat the threads of the attaching bolts with a oil-resistant sealer and install the bolts. Tighten the oil pan to

cover attaching bolts to 12–18 ft. lbs. Tighten the cover to block attaching bolts to 12–18 ft. lbs.

23. Apply Lubriplate or equivalent to the oil seal rubbing surface of the vibration damper inner hub to prevent damage to the seal.

24. Line up the crankshaft vibration damper keyway with the key on the crankshaft. Install the vibration damper on the crankshaft. Install the capscrew and washer and tighten to 70–90 ft. lbs. Install the crankshaft pulley.

25. Lubricate the fuel pump lever with heavy engine oil and install the pump using a new gasket. Connect the fuel pump outlet pipe as required.

26. Install the alternator pivot bolt and bolt attaching the alternator adjusting arm to the water pump.

27. Position the fan shroud over the water pump. Install the pulley, spacer and fan. Install and adjust the drive belts. Connect the radiator, heater and bypass hoses. Position the fan shroud on the radiator and install the attaching bolts.

28. Fill and bleed the cooling system. Drain the crankcase and replace the oil filter.

29. Connect the battery cable. Run the engine and check for coolant and oil leaks. Check the coolant level. Check and adjust the ignition timing.

30. Install the air cleaner and intake duct assembly including the crankcase ventilation hose.

30. Road test the vehicle for proper operation.

7.5L ENGINE

1. Bring the engine to No. 1 piston at TDC (top dead center) on the compression stroke. Disconnect the negative battery cable. Drain the cooling system.

2. Remove the radiator shroud and fan.

3. Disconnect the upper and lower radiator hoses and the automatic transmission oil cooler lines from the radiator if so equipped.

4. Remove the radiator upper support and remove the radiator.

5. Remove the alternator splash shield. Loosen the alternator attaching bolts and air conditioning compressor idler pulley and remove the drive belts with the water pump pulley. Remove the bolts attaching the compressor support to the water pump and remove the bracket (support), if so equipped.

6. Remove the crankshaft pulley from the vibration damper. Remove the bolt and washer attaching the crankshaft damper and remove the damper with a puller. Remove the Woodruff key from the crankshaft.

7. Loosen the bypass hose at the

water pump and disconnect the heater return tube at the water pump.

8. Relieve fuel system pressure. Disconnect and plug the fuel inlet and outlet lines at the fuel pump and remove the fuel pump on vehicles equipped with a carburetor.

9. Remove the bolts attaching the front cover to the cylinder block. Cut the oil pan seal flush with the cylinder block prior to separating the cover from the cylinder block. Remove the front cover and water pump as an assembly. Discard the front cover gasket and oil pan seal.

10. Clean all of the gasket sealing surfaces on both the front cover and the cylinder block.

11. Ensure that the engine timing marks on the sprockets are aligned.

12. Remove the camshaft sprocket capscrew, washer and fuel pump eccentric. Slide both sprockets and the timing chain forward and remove them as an assembly.

13. Position the sprockets and timing chain on the camshaft and crankshaft. Be certain that the timing marks on the sprockets are correctly aligned.

14. Install the fuel pump eccentric, washers and camshaft sprocket capscrew. Tighten the camshaft capscrew to 40–45 ft. lbs.

15. Coat the gasket surface of the oil pan with sealer. Cut and position the required sections of a new seal on the oil pan. Apply sealer to the corners.

16. Coat the gasket surfaces of the cylinder block and cover with sealer and position the new gasket on the block.

17. Position the front cover on the cylinder block. Use care not to damage the seal and gasket.

18. Coat the front cover attaching screws with sealer and install them. It may be necessary to force the front cover downward to compress the oil pan seal in order to install the front cover attaching bolts.

19. Tighten the oil pan to front cover attaching bolts to 9–11 ft. lbs.

20. Tighten the front cover to engine block attaching bolts to 15–21 ft. lbs.

21. Install the vibration damper capscrew and washer and tighten to 70–90 ft. lbs.

22. Install the crankshaft pulley and water pump pulley.

23. Install the front end engine accessory drive hardware.

24. Install and adjust all drive belts. Tighten the alternator mounting and compressor idler pulley.

25. Install alternator splash shield.

26. Install radiator and support assemblies. Install all water hoses and reconnect the transmission oil cooler lines.

27. Install the fan assembly.

28. Drain the crankcase and replace the oil filter.

29. Refill the crankcase. Reconnect the battery cable. Fill and bleed the cooling system.

30. Start the engine, check for oil and coolant leaks. Check and adjust ignition timing. Road test the vehicle for proper operation.

E Series

4.9L ENGINE

1. Disconnect the negative battery cable.

2. Drain the cooling system.

3. Remove the front cover assembly.

4. Crank the engine until the timing marks are in the correct position.

5. Install a camshaft gear puller or equivalent and remove the camshaft and crankshaft gears.

6. Installation is the reverse of the removal procedure. Make sure that the camshaft gear key spacer and thrust plate are properly installed and timing marks are in the correct position. 7. Drain the crankcase and replace the oil filter. Refill all fluid levels.

5.0L AND 5.8L ENGINES

1. Bring engine to No. 1 cylinder at TDC (top dead center) on the compression stroke. Disconnect the negative battery cable at the battery. Drain the radiator and remove the radiator from the vehicle. Disconnect and plug transmission lines if equipped with automatic transmission.

2. Remove the air conditioning idler pulley, bracket and drive belt if equipped.

3. Remove the upper radiator hose from the engine block. Remove the fan and shroud as an assembly. Raise and support the vehicle safely.

4. Loosen the thermactor and alternator drive belts.

5. Disconnect the lower radiator hose at the water pump. Relieve fuel system pressure. Disconnect the fuel line at the fuel pump and remove the pump on vehicles equipped with a carburetor. Lower the vehicle.

6. Remove the bypass hose. Remove the power steering pump drive belt if equipped. Remove the water pump pulley and disconnect the heater hose at the water pump.

7. Remove the air conditioning compressor upper bracket and the power steering pump mount.

8. Remove the crankshaft pulley. Remove the oil pan to front cover bolts. Remove the front cover.

9. Ensure that engine timing marks on the sprockets are correctly aligned.

10. Remove the camshaft sprocket cap screw, washers and fuel pump ec-

centric. Slide both sprockets and the timing chain forward and remove the chain and sprockets as an assembly.

11. Install the sprockets and timing chain on the camshaft. Be sure that the timing marks are properly aligned.

12. Install the fuel pump, eccentric, washers and camshaft sprocket cap screw. Tighten the cap screw to 40-45 ft. lbs.

13. Clean the front cover, fuel pump and damper. Clean the gasket surface at the pan and trim the gasket. Clean the front cover gasket surface at the block.

14. Replace the oil seal in the front cover. Position the gasket on the front cylinder cover. Apply a silicone sealer to the oil pan and cylinder block. Cut the pan gasket and position on pan and front cover.

15. Install the front cover, fuel pump and vibration damper.

16. Tighten the oil pan to front cover attaching bolts to 12-18 ft. lbs.

17. Tighten the front cover to engine block attaching bolts to 12-18 ft. lbs.

18. Install the vibration damper cap screw and washer and tighten to 70-90 ft. lbs.

19. Install the power steering pump and water pump bypass hose. Connect the heater hose at the water pump.

20. Install the air conditioning compressor upper bracket, water pump pulley and power steering drive belt.

21. Install the alternator belt, thermactor belt and fan/shroud assembly.

22. Adjust the power steering belt.

23. Install the air conditioning drive belt idler pulley and bracket. Install the air conditioning drive belt and adjust.

24. Install the upper radiator hose.

25. Raise and safely support the vehicle. Install the fuel pump with a new gasket and connect the fuel line on vehicles equipped with a carburetor.

26. Install the lower radiator hose. Adjust the alternator and air injection pump drive belts.

27. Drain the crankcase and replace the oil filter as necessary. Lower the vehicle.

28. Connect the battery cable. Fill the crankcase and cooling system.

29. Start the engine, check for oil and coolant leaks. Check and adjust ignition timing. Road test the vehicle for proper operation.

7.5L ENGINE

1. Bring the engine to No. 1 piston at TDC (top dead center) on the compression stroke. Disconnect the negative battery cable. Drain the cooling system.

2. Remove the radiator shroud and fan.

3. Disconnect the upper and lower

Timing mark alignment—
5.0L, 5.8L and 7.5L engines

radiator hoses and the automatic transmission oil cooler lines from the radiator if so equipped.

4. Remove the radiator upper support and remove the radiator.

5. Remove the alternator splash shield. Loosen the alternator attaching bolts and air conditioning compressor idler pulley and remove the drive belts with the water pump pulley. Remove the bolts attaching the compressor support to the water pump and remove the bracket (support), if so equipped.

6. Remove the crankshaft pulley from the vibration damper. Remove the bolt and washer attaching the crankshaft damper and remove the damper with a puller. Remove the Woodruff key from the crankshaft.

7. Loosen the bypass hose at the water pump and disconnect the heater return tube at the water pump.

8. Relieve the fuel system pressure. Disconnect and plug the fuel inlet and outlet lines at the fuel pump and remove the fuel pump on vehicles equipped with a carburetor.

9. Remove the bolts attaching the front cover to the cylinder block. Cut the oil pan seal flush with the cylinder block prior to separating the cover from the cylinder block. Remove the front cover and water pump as an assembly. Discard the front cover gasket and oil pan seal.

10. Clean all of the gasket sealing surfaces on both the front cover and the cylinder block.

11. Ensure that the engine timing marks on the sprockets are aligned.

12. Remove the camshaft sprocket cap screw, washer and fuel pump eccentric. Slide both sprockets and the timing chain forward and remove them as an assembly.

13. Position the sprockets and timing chain on the camshaft and crankshaft. Be certain that the timing marks on the sprockets are correctly

aligned.

14. Install the fuel pump eccentric, washers and camshaft sprocket cap-screw. Tighten the camshaft cap-screw to 40-45 ft. lbs.

15. Coat the gasket surface of the oil pan with sealer. Cut and position the required sections of a new seal on the oil pan. Apply sealer to the corners.

16. Coat the gasket surfaces of the cylinder block and cover with sealer and position the new gasket on the block.

17. Position the front cover on the cylinder block. Use care not to damage the seal and gasket.

18. Coat the front cover attaching screws with sealer and install them. It may be necessary to force the front cover downward to compress the oil pan seal in order to install the front cover attaching bolts.

19. Tighten the oil pan to front cover attaching bolts to 9-11 ft. lbs.

20. Tighten the front cover to engine block attaching bolts to 15-21 ft. lbs.

21. Install the vibration damper cap-screw and washer and tighten to 70-90 ft. lbs.

22. Install the crankshaft pulley and water pump pulley.

23. Install the front end engine accessory drive hardware.

24. Install and adjust all drive belts. Tighten the alternator mounting and compressor idler pulley.

25. Install alternator splash shield.

26. Install radiator and support assemblies. Install all water hoses and reconnect the transmission oil cooler lines.

27. Install the fan assembly.

28. Drain the crankcase and replace the oil filter.

29. Refill the crankcase. Reconnect the battery cable. Fill and bleed the cooling system.

30. Start the engine, check for oil and coolant leaks. Check and adjust ignition timing. Road test the vehicle for proper operation.

Camshaft

REMOVAL & INSTALLATION

4.9L Engine

1. Drain the cooling system. Disconnect the negative battery cable. Remove the radiator shroud and radiator.

2. Remove the front cover.

3. Remove air cleaner and crankcase vent tube at the rocker cover.

4. Disconnect accelerator cable, choke cable and hand throttle cable if so equipped. Remove accelerator cable retracting spring.

5. If applicable, remove air condi-

tioning compressor and power steering belts.

6. Disconnect oil filler hose from rocker cover.

7. Remove distributor cap and wiring as an assembly, then disconnect vacuum line and primary wire and remove distributor (mark distributor for correct installation).

8. Remove fuel pump on vehicles equipped with carburetor.

9. Remove valve rocker arm cover, loosen rocker arm stud nuts and move rocker arms to one side. Remove pushrods, identifying each so that they may be installed in their original locations.

10. Remove pushrod cover and valve lifters, identifying the position of each.

11. Turn crankshaft to align timing marks, remove camshaft thrust plate bolts and carefully pull camshaft and gear from block.

12. To install camshaft reverse the removal procedures.

13. Oil journals and apply Lubriplate to lobes, then carefully install camshaft, spacer, thrustplate and gear as an assembly, making sure timing marks are aligned, then tightening thrustplate bolts to 9-12 ft. lbs.

14. Measure the camshaft endplay. If the endplay is more than 0.009 in., replace the thrust plate.

15. Do not rotate crankshaft until distributor is installed. Drain the crank-

Camshaft assembly-4.9L engine

Typical camshaft assembly-8 cylinder engines

case replace oil filter. Refill all fluid levels. Check and adjust timing as necessary.

5.0L, 5.8L and 7.5L Engines

1. Disconnect the negative battery cable. Drain the cooling system. Remove all required components to gain access to the intake manifold. On fuel injected vehicles relieve the fuel pressure. Remove the intake manifold assembly and valley pan, if so equipped.

2. Remove the radiator and front grille assembly as required. If equipped with A/C discharge the system then remove the condenser if necessary to gain clearance to remove the camshaft.

3. Remove the rocker covers and either remove the rocker arm shafts or loosen the rockers on their pivots. Remove the pushrods. The pushrods must be reinstalled in their original positions.

4. Remove the valve lifters in sequence with a magnet or equivalent. They must be replaced in their original positions.

5. Remove the timing cover and timing chain and sprockets.

6. Remove the camshaft thrust plate attaching screws and carefully slide the camshaft out of its bearing bores. Use extra caution not to scratch

Piston and Connecting Rod POSITIONING

Piston-4.9L engine

Piston-5.0L and 5.8L engines

Piston-7.5L engine

the bearing journals with the camshaft lobes.

7. Install the camshaft in the reverse order of removal. Coat the camshaft with engine oil liberally before installing it. Slide the camshaft into the engine very carefully so as not to scratch the bearing bores with the camshaft lobes. Install the camshaft thrust plate and tighten the attaching screws to 9-12 ft. lbs. Measure the camshaft endplay. If the endplay is more than 0.009 in., replace the thrust plate. Assemble the remaining components in the reverse order of removal.

DIESEL ENGINE MECHANICAL

Engine

REMOVAL & INSTALLATION

F Series

1. Disconnect battery ground cables from both batteries.
2. Scribe alignment marks at hood hinges and remove hood.
3. Drain cooling system.
4. Remove air cleaner and intake duct assembly. Install intake manifold cover over air intake opening.
5. Remove radiator fan shroud halves.
6. Remove fan and clutch assembly. Left-hand thread. Remove by turning nut clockwise.
7. Disconnect radiator upper and lower hoses from radiator.
8. Disconnect and plug automatic transmission oil cooler lines at radiator, if so equipped.
9. Remove radiator.
10. Loosen A/C compressor, if so equipped and remove drive belt.
11. Remove A/C compressor from its mounting, if so equipped and position it on radiator upper support.
12. Loosen power steering pump and remove drive belt. Remove power steering pump and position out of the way on left side of engine compartment.
13. Disconnect fuel supply line heater and alternator wires at alternator. Disconnect oil pressure sending unit wire at sending unit. Remove oil pressure sender from dash panel and lay on engine.
14. Disconnect accelerator cable from injection pump. Disconnect speed control cable from injection pump, if so equipped. Remove accel-

ator cable bracket with cables attached, from intake manifold and position out of the way.

15. Disconnect transmission kickdown rod from injection pump, if so equipped. Disconnect main wiring harness connector from right side of engine. Disconnect engine ground strap from rear of engine. Disconnect fuel return hose from left rear of engine. Remove the vacuum supply hose from the vacuum pump.

16. Remove upper transmission-to-engine attaching bolts.

17. Disconnect heater hoses from water pump and right cylinder head. Disconnect water temperature sender wire from sender on left front of engine block. Disconnect water temperature overheat light switch wire from switch on top of left cylinder head. Position wires out of the way.

18. Raise and safely support the vehicle.

19. Disconnect both battery ground cables from lower front of engine.

20. Disconnect and cap fuel inlet line at fuel supply pump.

21. Disconnect starter cables at starter motor.

22. Disconnect muffler inlet pipe at exhaust manifold.

23. Disconnect engine insulators from No. 1 crossmember. Remove flywheel inspection plate. Remove converter-to-flywheel attaching nuts, if so equipped. Lower vehicle.

24. Support transmission with a floor jack. Remove lower transmission to engine attaching bolts.

25. Attach engine lifting sling and chain hoist. Raise engine high enough to clear number 1 crossmember and pull forward.

26. Rotate the front of the engine approximately 45 degrees to the left and lift it out of the engine compartment.

27. When installing the engine; lower engine into engine compartment. Use care not to damage windshield wiper motor when installing engine in vehicle.

28. Start transmission main shaft into clutch disc. It may be necessary to adjust position of transmission in relation to engine if main shaft binds or will not enter clutch disc. If engine hangs up after main shaft enters clutch disc, rotate crankshaft slowly (transmission in gear) until mainshaft splines mesh with clutch disc splines. Align converter to flywheel studs, if so equipped.

29. Lower into engine insulator brackets on the number 1 crossmember.

30. Install lower transmission to engine attaching bolts and tighten. Remove engine lifting sling. Raise and safely support the vehicle.

31. Install converter to flywheel at-

taching nuts, if so equipped. Install flywheel inspection plate.

32. Install engine insulator support to crossmember bracket attaching nuts and washers. Connect muffler inlet pipes to exhaust manifolds. Connect both battery ground cables to the lower front of the engine. Connect starter cables to starter. Install fuel pump inlet line on fuel pump. Lower vehicle.

33. Connect water temperature sender wire to sender on left front of engine block. Connect wire to water temperature overheat light switch on top of left cylinder head. Install heater hoses on right cylinder head and water pump and tighten clamps.

34. Connect engine ground strap at rear of engine. Connect fuel return hose at left rear of engine. Connect transmission kickdown rod, if so equipped.

35. Install accelerator cable bracket on intake manifold. Connect accelerator cable to injection pump. Connect speed control cable, if so equipped, to injection pump.

36. Install oil pressure sender on dash panel. Connect oil pressure gauge sender wire to oil pressure sender.

37. Connect fuel supply line heater and alternator wires to alternator.

38. Install power steering pump and drive belt. Do not adjust belt at this time.

39. Install A/C compressor and drive belt. Adjust A/C compressor and power steering pump drive belts.

40. Install radiator. Connect automatic transmission oil cooler lines at radiator, if so equipped. Connect upper and lower radiator hoses to radiator and tighten hose clamps. Fill and bleed the cooling system.

41. Install fan and clutch assembly. Turn nut counterclockwise to tighten.

42. Install radiator fan shroud halves.

43. Remove intake manifold cover and install air cleaner. Install intake duct assembly.

44. Install hood using scribe marks drawn on hood at removal.

45. Connect battery ground cables at both batteries. Check the engine oil level and fill as required. Run engine and check for fuel, oil and coolant leaks.

E Series

1. Remove the engine (doghouse) cover. Remove the air cleaner assembly and inlet duct.

2. Disconnect battery ground cables from both batteries.

3. Drain cooling system.

4. Remove the front bumper, grille assembly and gravel deflector.

5. Remove the speed control servo

bracket and position out of the way.

6. Mark the location and remove the hood latch and cable assembly from the grille upper support bracket. Remove the upper support bracket.

7. Evacuate the air conditioning system. Disconnect the A/C lines from the condensor and remove the condensor.

8. Disconnect automatic transmission oil cooler lines at radiator, if so equipped.

9. Remove the radiator cooling fan (left hand thread is used on fan/clutch assembly) and clutch. Remove the shroud.

10. Disconnect radiator upper and lower hoses from radiator. Remove radiator.

11. Loosen and remove the vacuum pump and drive belt. Disconnect vacuum hoses from the transmission shift modulator tube if so equipped. Loosen A/C compressor, if so equipped and remove drive belt.

12. Remove A/C compressor from its mounting, if so equipped and position it on radiator upper support.

13. Loosen power steering pump and remove drive belt. Remove power steering pump and position out of the way on left side of engine compartment.

14. Disconnect fuel supply line heater and alternator wires at alternator. Disconnect oil pressure sending unit wire at sending unit.

15. Disconnect accelerator cable from injection pump. Disconnect speed control cable from injection pump, if so equipped. Remove accelerator cable bracket with cables attached, from intake manifold and position out of the way.

16. Disconnect transmission kickdown rod from injection pump and all vacuum lines, if so equipped. Disconnect main wiring harness connector from right side of engine. Disconnect engine ground strap from rear of engine. Disconnect fuel return hose from left rear of engine.

17. Remove upper transmission-to-engine attaching bolts.

18. Disconnect heater hoses from water pump and right cylinder head. Disconnect water temperature sender wire from sender on left front of engine block. Disconnect water temperature overheat light switch wire from switch on top of left cylinder head. Position wires out of the way.

19. Raise and safely support the vehicle.

20. Disconnect and cap fuel inlet line at fuel supply pump.

21. Disconnect starter cables at starter motor.

22. Disconnect muffler inlet pipe at exhaust manifold.

23. Disconnect engine insulators

from No. 1 crossmember. Remove flywheel inspection plate. Remove converter-to-flywheel attaching nuts, if so equipped. Lower vehicle.

24. Support transmission with a floor jack. Remove lower transmission to engine attaching bolts.

25. Attach engine lifting sling and floor crane. Raise engine up and out of vehicle from the driver/cargo compartment.

26. Lower engine into driver/cargo compartment. Install engine to transmission.

27. Install transmission to engine attaching bolts and tighten.

28. To complete the rest of the installation reverse the removal procedure. Connect battery ground cables at both batteries. Check the engine oil level and fill as required. Run engine and check for fuel, oil and coolant leaks.

Cylinder Head

REMOVAL & INSTALLATION

1. Disconnect battery ground cables from both batteries.

2. Drain cooling system.

3. Remove the radiator fan shroud.

4. Remove the radiator cooling fan (left hand thread is used on fan/clutch assembly) and clutch assembly.

5. Disconnect all wiring from alternator and fuel filter/water separator.

6. Remove the alternator belt and alternator.

7. Remove the vacuum pump drive belt and vacuum pump.

8. Disconnect and cap all fuel lines. Remove alternator and vacuum pump mounting bracket. On F series remove fuel filter with bracket as an assembly.

9. Remove the heater hose from the cylinder head.

10. Remove the injection pump.

11. Remove the intake manifold and valley cover.

12. Raise and safely support the vehicle.

13. Disconnect the muffler inlet pipe from the exhaust manifold.

14. On right side cylinder head, remove bolt holding the transmission dipstick and engine oil dipstick tube assembly (fasteners).

15. Lower the vehicle.

16. Remove the exhaust manifolds from the engine.

17. Remove the valve cover, rocker arm and pushrods.

18. Remove the injection nozzles and glow pugs.

19. Remove the cylinder head bolts. Attach a suitable lifting device and lift cylinder head from the engine. Pre chambers may fall out of cylinder head upon removal.

20. Installation is the reverse of the removal procedure. Always install new cylinder head gasket. Tighten intake manifold, exhaust manifold and cylinder head retaining bolts in sequence and to the correct specifications. Refill and bleed cooling and fuel system as required.

Rocker Arms/Shaft

REMOVAL & INSTALLATION

1. Disconnect ground cables from both batteries.

2. On E series, remove fan shroud and engine (doghouse) cover.

NOTE: The following service procedure Steps 3-7 apply to the right side valve cover removal on E series only.

3. Remove engine oil dipstick tube fasteners and remove dipstick, tube assembly and valve cover bracket.

**Rocker arm assembly—
6.9L and 7.3L engines**

4. Remove transmission filler tube fasteners and remove filler tube and dipstick.

5. Raise vehicle and safely support the vehicle.

6. Remove nuts attaching right engine mount insulator (motor mount) to frame. Slightly raise right side of the engine until fuel filter header touches vehicle sheet metal. Install suitable wood block between insulator and frame. Lower engine on block.

7. Lower the vehicle.

8. Remove valve cover retaining bolts and remove covers. Remove valve rocker arm post mounting bolts. Remove valve rocker arms, posts and pushrods in order and identify so they are installed in the correct positions.

9. Install pushrods in correct positions, making sure they are fully seated in tappet pushrod seats. Install copper colored end of pushrod toward rocker arm.

10. Install valve rocker arms and posts in correct position. Install valve rocker arm post attaching bolts.

11. Turn engine over by hand until timing mark is at 11 o'clock position as viewed from front of engine. Install all rocker arm post attaching bolts and tighten to 20 ft. lbs. Install valve covers on with new gaskets on cylinder heads.

NOTE: The following service procedure Steps 12-15 apply to the right side valve cover installation on E series only.

12. Raise and safely support the vehicle. Raise engine, remove wood block and lower engine onto crossmember.

13. Install insulator (motor mount) attaching washers and nuts.

14. Lower vehicle. Install transmission filler tube and transmission oil dipstick.

15. Install engine oil dipstick tube and valve cover bracket. Install engine oil dipstick.

STEP 1. TIGHTEN BOLTS TO (65 FT-LB) IN NUMBERED SEQUENCE SHOWN ABOVE.

STEP 2. TIGHTEN BOLTS TO (85 FT-LB) IN NUMBERED SEQUENCE SHOWN ABOVE.

STEP 3. TIGHTEN BOLTS TO (100 FT-LB) IN LINE SEQUENCE SHOWN ABOVE.

STEP 4. REPEAT STEP NO. 3.

Cylinder head bolt tightening sequence—6.9L and 7.3L engines

16. Install radiator fan shroud halves. Install ground cables to both batteries.

17. Start the engine and inspect for oil leaks.

Intake Manifold

REMOVAL & INSTALLATION

1. Disconnect ground cables from both batteries.

2. On E series, remove engine (doghouse) cover.

3. Remove air cleaner and install intake manifold cover or equivalent.

4. On E series disconnect fuel inlet line and fuel return line from fuel filter. Remove fuel filter bracket attaching bolts and remove fuel filter and bracket as an assembly.

5. Remove injection pump assembly.

6. On F series, remove fuel return hoses from No. 7 and No. 8 rear nozzles and remove return hose to fuel tank.

7. Remove glow plug harness and controller. Remove engine wiring harness from engine. Remove engine harness ground cable from back of left cylinder head.

8. Remove intake manifold retain-

ing bolts and remove intake manifold.

To install:

9. Clean cylinder block gasket surfaces of silicone rubber sealant or oil. Apply a $\frac{1}{8}$ inch bead of Silicone Rubber Sealant D6AZ-19562-A or equivalent, to each end of the cylinder block.

10. Install intake manifold and tighten to specifications using the correct service procedure.

11. Install engine wiring harness on engine. Connect engine wiring harness ground wire to rear of left cylinder head.

12. Install glow plug controller and harness.

13. On E series, install fuel filter and bracket as an assembly. Install fuel filter return line and fuel filter inlet fuel line.

14. Install injection pump.

15. Reconnect fuel tank return hose and No. 7 and No. 8 nozzle fuel return hoses.

16. Remove intake manifold cover and install air cleaner. Install engine (doghouse) cover on E series.

17. Connect ground cables to both batteries. Start engine. Check for oil and fuel leaks. Bleed fuel system as required.

18. Road test the vehicle for proper operation.

Valley pan-6.9L and 7.3L engines

STEP 1. TIGHTEN BOLTS TO 24 FT-LB IN NUMBERED SEQUENCE SHOWN ABOVE.
STEP 2. TIGHTEN BOLTS TO 24 FT-LB IN LINE SEQUENCE SHOWN ABOVE.

Intake manifold torque sequence-6.9L and 7.3L engines

Exhaust Manifold

REMOVAL & INSTALLATION

F Series

1. Disconnect ground cables from both batteries.

2. Raise vehicle and safely support the vehicle as needed.

3. Disconnect muffler inlet pipe from exhaust manifolds.

4. Remove exhaust manifold attaching bolts and manifold.

5. Installation is the reverse of the removal procedure. Apply anti-seize compound on exhaust manifold bolt threads and install manifold with new gasket. Tighten bolts (in 2 steps), in the proper sequence to 35 ft. lbs.

STEP 1. TIGHTEN BOLTS TO 35 FT-LB IN NUMBERED SEQUENCE SHOWN ABOVE.

STEP 2. TIGHTEN BOLTS TO 35 FT-LB IN LINE SEQUENCE SHOWN ABOVE.

Exhaust manifold torque sequence-6.9L and 7.3L engines

E Series

1. Remove engine (doghouse) cover. Disconnect battery ground cables from both batteries.

2. For right side only, remove radiator fan shroud halves.

3. For right side removal only, remove engine oil dipstick tube fasteners. Remove dipstick and tube. Remove transmission filler tube fasteners. Remove filler tube and dipstick.

4. Raise vehicle and safely support the vehicle.

5. For right side only, remove nuts attaching engine mount insulator to frame. Slightly raise right side of the engine until fuel filter header touches vehicle sheet metal. Install suitable wood block between insulator and frame. Lower engine on block.

6. Remove muffler inlet pipe from exhaust manifolds. Lower vehicle.

7. Remove exhaust manifold retaining bolts and exhaust manifold.

8. Installation is the reverse of the removal procedure. Apply anti-seize compound on exhaust manifold bolt threads and install manifold with new gasket. Tighten bolts (in 2 steps), in the proper sequence to 35 ft. lbs.

Engine Front Cover

REMOVAL & INSTALLATION

1. Disconnect ground cables from both batteries. Drain cooling system.
2. Remove air cleaner and install intake air opening cap intake manifold cover or equivalent.
3. Remove radiator fan shroud.
4. Remove fan and clutch assembly. Left hand thread is used on the fan clutch assembly. Remove by turning nut clockwise.
5. Remove injection pump.
6. Remove injection pump adapter.
7. Remove water pump and components.
8. Raise vehicle and safely support the vehicle.
9. Remove crankshaft pulley and vibration damper using suitable tools.
10. Remove ground cables at front of engine. Remove bolts attaching front cover to engine block and oil pan.
11. Lower vehicle. Remove bolts attaching engine front cover to engine block and remove front cover.
12. Remove old gasket material and clean all sealing surfaces. Install fabricated alignment dowels if necessary on engine block and oil pan to align front cover and gaskets.
13. Apply a $\frac{1}{8}$ inch bead of silicone sealer or equivalent, to rear corners of oil pan and apply a $\frac{1}{4}$ in. bead of silicone sealer or equivalent on oil pan.
14. Install engine front cover in position, on oil pan dowels and install re-

Removing vibration damper

taining attaching bolts. Remove engine front cover alignment dowels if required. Install and hand tighten remaining front cover bolts.

15. Install water pump gasket and water pump. Remove alignment dowels if required and install remaining attaching bolts. Tighten (with sealer around threads) all water pump bolts to 14 ft. lbs.

16. Tighten engine front cover bolts. Install injection pump adapter and injection pump.

17. Reconnect all cooling hoses. Raise and safely support the vehicle.

18. Lubricate damper seal nose with clean engine oil and install crankshaft vibration damper. Add silicone rubber sealant, to engine side of retaining bolt washer to prevent oil leakage past keyway. Install vibration damper attaching bolt and tighten to 90 ft. lbs.

19. Install crankshaft pulley. Install both battery ground cables on front of engine. Lower vehicle.

20. Install alternator adjusting arm bracket and water pump pulley.

21. Install power steering pump bracket, power steering pump and drive belt.

22. Install A/C compressor bracket, compressor and drive belt.

23. Install alternator adjusting arm, alternator and vacuum pump drive belts. Adjust all drive belts.

24. Install fan and clutch assembly. Install radiator fan shroud halves.

25. Remove intake manifold cover. Install air cleaner and reconnect ground cables to both batteries.

26. Fill and bleed cooling system. Start engine and inspect for coolant and oil leaks.

Front Cover Oil Seal

REMOVAL & INSTALLATION

1. Disconnect battery ground cables from both batteries. Remove radiator fan shroud.

2. Remove fan and clutch assembly. A left hand thread is used to retain the assembly. Remove by turning nut clockwise.

3. Remove all drive belts. Raise and safely support the vehicle.

4. Remove crankshaft pulley. Remove bolt attaching damper to crankshaft.

5. Install a suitable puller and remove crankshaft vibration damper.

6. Pry out front oil seal from the front cover.

7. Installation is the reverse of the removal procedure. Add silicone rubber sealant to engine side of washer (in area of keyway only), to prevent oil leakage past keyway. Install bolt attaching vibration damper to crankshaft and tighten to 90 ft. lbs. Adjust all drive belts.

Crankshaft Drive Gear

REMOVAL & INSTALLATION

1. Disconnect ground cables from both batteries. Remove air filter and install intake manifold cover on intake manifold opening.

2. Drain cooling system. Remove radiator fan shroud.

3. Remove fan and clutch assembly. A left hand thread is used on this assembly. Turn nut clockwise to remove.

4. Remove alternator and vacuum pump belts.

5. Remove A/C compressor and position out of the way. Remove A/C mounting bracket.

6. Remove power steering pump and position out of the way. Remove power steering pump bracket.

7. Remove water pump pulley and water pump.

Front cover dowel positioning

Timing marks—6.9L and 7.3L engines

8. Remove engine front cover assembly.

9. Install a suitable puller remove crankshaft gear.

10. Install crankshaft gear and aligning crankshaft drive gear timing mark.

11. Clean all sealing surfaces. Install engine front cover.

12. Install crankshaft vibration damper. Apply silicone rubber sealant to engine side of washer (in area of keyway only), to prevent oil leakage past keyway. Install crankshaft vibration damper attaching bolt and tighten to 90 ft. lbs.

13. Install crankshaft pulley and water pump.

14. Install injection pump adapter and injection pump.

15. Install all cooling hoses.

16. Install power steering pump bracket, power steering pump and drive belt.

17. Install A/C compressor bracket, compressor and drive belt.

18. Install alternator adjusting arm. Install alternator and vacuum pump drive belts.

19. Adjust all drive belts. Check and set injection pump timing.

20. Install radiator fan and clutch assembly and radiator fan shroud halves. Fill and bleed cooling system.

21. Remove intake manifold cover. Install air cleaner assembly and connect ground cables to both batteries. Start engine and inspect for oil and coolant leaks.

Injection Pump Drive Gear

REMOVAL & INSTALLATION

1. Disconnect ground cables from both batteries. Remove engine (doghouse) cover on E series.

2. Remove air cleaner and install intake opening cover.

3. Remove injection pump.

4. Remove bolts attaching injection pump drive gear cover to engine block and remove cover.

5. Turn engine over by hand to TDC (compression stroke) of No. 1 piston. Remove glow plugs, to facilitate turning engine over by hand.

6. To determine that No. 1 piston is at TDC (compression stroke), position injection pump drive gear dowel at 4 o'clock position. The scribe line in vibration damper should be at TDC.

7. To aid aligning the timing marks, the pump drive gear and the camshaft gear are marked with "Y" timing marks. The crankshaft and camshaft gears are marked with "o" (dot) alignment marks. With engine at TDC com-

pression for No. 1 cylinder, the "Y" marks should be aligned.

8. Slide injection pump gear back (do not remove) to expose top of camshaft gear when looking down into the front cover. In addition to the "Y", the gear teeth adjacent to the "Y" on the camshaft gear are permanently dyed.

9. Remove injection pump drive gear.

10. Clean all gasket and sealing surface.

NOTE: To determine that No. 1 piston is at TDC of compression stroke, position injection pump drive gear dowel at 4 o'clock position. The scribe line in vibration damper should be at TDC.

11. With drawn line on drive gear at 6 o'clock position, install gear and align all drive gear timing marks. Use extreme care to avoid disturbing injection pump drive gear, once it is in position.

12. Apply 1/8 inch bead of silicone sealant, along bottom surface of injection pump drive gear cover.

13. Install injection pump drive gear cover and tighten retaining bolts to 14 ft. lbs. Apply perfect seal sealing compound or equivalent, to bolt threads before assembly. With injection pump drive gear installed, the injection pump drive gear cannot jump timing.

14. Remove intake manifold cover. Install air cleaner and ground cables to both batteries.

15. Start engine and bleed cooling and fuel system if necessary. Check for oil, fuel and coolant leaks. Install engine (doghouse) cover on E series.

Camshaft Drive Gear

REMOVAL & INSTALLATION

1. Disconnect ground cables from both batteries. Remove air cleaner and install intake manifold cover.

Injection pump drive gear cover

2. Drain cooling system.

3. Remove alternator and vacuum pump drive belts.

4. Remove A/C compressor mounting bolts and position compressor out of the way. Remove A/C compressor mounting bracket.

5. Remove power steering pump and position out of the way. Remove power steering pump bracket.

6. Remove water pump pulley and water pump.

7. Remove engine front cover. Remove camshaft Allen screw and washer.

8. Install suitable gear puller and remove gear.

NOTE: At this point of the service procedure, the fuel pump cam and thrust flange spacer can be removed by first removing the the fuel pump then by using a suitable puller to press it off the camshaft.

9. Install camshaft drive gear against fuel pump cam, aligning timing mark with mark on crankshaft drive gear.

10. Install camshaft Allen screw and tighten to 15 ft. lbs.

Camshaft drive gear assembly

11. Install engine front cover.
12. Install water pump.
13. Install injection pump gear and adapter. Install injection pump.
14. Install water pump pulley and power steering pump bracket. Install power steering pump and drive belt.
15. Install A/C compressor mounting bracket, compressor and drive belt. Install alternator and vacuum pump drive belts. Adjust all drive belts.
16. Reconnect ground cables to both batteries. Remove intake manifold cover and install air cleaner.
17. Start engine bleed cooling and fuel systems if necessary. Check for fuel, oil and coolant leaks.

Camshaft

REMOVAL & INSTALLATION

1. Remove engine from vehicle.
2. Position engine in a suitable engine work stand.
3. Remove injection pump and adapter.
4. Remove intake manifold and valve lifters, engine front cover and fuel pump.
5. Remove camshaft drive gear, fuel supply pump cam, spacer and thrust plate from the camshaft assembly.
6. Remove camshaft. Use care to avoid damaging camshaft bearings.
7. Coat camshaft lobes with multi-purpose grease or equivalent and lubricate journals with engine oil before installation. Carefully slide camshaft through bearings. Install camshaft thrust plate onto cylinder block.
8. Install spacer and fuel pump cam against camshaft thrust flange using suitable tools.
9. Install camshaft drive gear against fuel pump cam, aligning timing mark with timing mark on crankshaft drive gear.
10. Install camshaft allen screw and tighten to 15 ft. lbs.
11. Install fuel pump assembly. Install new crankshaft oil seal in engine front cover. Install engine front cover.
12. Install water pump.
13. Install injection pump adapter. Lubricate the valve lifters and their bores with clean engine oil. Install the valve lifters in their original positions. Install the valve lifter guides. Install the valve lifter guide retainer.
14. Install pushrods, copper colored ends toward rocker arms making sure they are seated fully in pushrod seats. Install rocker arms and valve covers.
15. Install intake manifold and injection pump assemblies.
16. Install engine into vehicle. Check and fill all fluid levels. Start engine, bleed cooling and fuel system if necessary and check for leaks. Check injection pump timing and road test the vehicle for proper operation.

tion pump timing and road test the vehicle for proper operation.

Piston and Connecting Rod POSITIONING

ENGINE BLOCK

TOWARD CAMSHAFT

Piston orientation—6.9L and 7.3L engines

ENGINE LUBRICATION

Oil Pan

REMOVAL & INSTALLATION

Bronco and F Series

4.9L ENGINE

1. Disconnect the negative battery cable. Drain the crankcase and the cooling system.
2. On some applications, it may be necessary to remove the radiator and shroud assembly.
3. Remove the upper intake and throttle body on fuel injected vehicles only.
4. Raise and safely support the vehicle. Disconnect the starter cable and remove the starter assembly.
5. Remove engine front support insulator to support bracket nuts and washers. Use a transmission jack or equivalent to raise the front of the engine (make sure fan clutch assembly

does not break radiator shroud) then install wood blocks or equivalent between the front support insulators and support brackets. Lower engine onto blocks and remove jack.

6. Remove the attaching bolts and oil pan. It may be necessary to remove the oil pump inlet tube and screen assembly in order to free the pan (drop oil pump assembly in pan).

7. Installation is the reverse of the removal procedure. Tighten the oil pump inlet tube assembly screws to 10–15 ft. lbs. and nut to 22–32 ft. lbs. Tighten the oil pan retaining bolts working from the center to the end after securing the corner bolts to 10–15 ft. lbs. Refill all fluid levels and bleed cooling system.

E Series

4.9L ENGINE

1. Disconnect the negative battery cable. Remove the engine (doghouse) cover. Remove the air cleaner and the carburetor. On fuel injected engines remove air cleaner and air inlet tubes from the throttle body.
2. If equipped with air conditioning, discharge the system and remove the compressor.
3. On some applications, disconnect the thermactor check valve inlet hose and remove the check valve. Remove the EGR valve. Drain cooling system and crankcase.
4. Remove the radiator hoses and transmission cooling lines. Unbolt the fan shroud and correctly position it on the fan. If equipped with automatic transmission, disconnect the oil filler tube.
5. Remove exhaust inlet pipe at manifold. Raise and support the vehicle safely. Disconnect and plug fuel pump inlet line on vehicles equipped with a carburetor. Remove the starter. Remove alternator splash shield and front engine support nuts.
6. Remove the power steering return line clip which is located in front of the No. 1 crossmember.
7. Raise the engine (make sure fan clutch assembly does not break radiator shroud) and wooden blocks under the engine mounts. Remove the oil pan dipstick tube.
8. Remove the oil pan bolts. Remove the pickup tube and screen from the oil pump (lay in oil pan). Remove the oil pan.
9. Installation is the reverse of the removal procedure. Tighten the oil pump pickup tube assembly screws to 10–15 ft. lbs. and nut to 22–32 ft. lbs. Tighten the oil pan retaining bolts working from the center to the end after securing the corner bolts to 10–15 ft. lbs. Refill all fluid levels and bleed cooling system.

Bronco and F Series**5.0L AND 5.8L ENGINES**

1. Disconnect the negative battery cable. Remove the oil dipstick (on pan entry models only). Remove the bolts attaching the fan shroud to the radiator and position the shroud over the fan.

2. On fuel injected vehicles, remove the upper intake manifold.

3. Remove the nuts and lockwashers attaching the engine support insulators to the chassis bracket.

4. Disconnect the oil cooler lines, if equipped with automatic transmission.

5. Raise the engine (make sure fan clutch assembly does not break radiator shroud) and place wood blocks under the engine supports. Drain the crankcase.

6. Remove the oil pan bolts and lower the oil pan onto the crossmember.

7. Remove the oil pump pick-up tube and screen. Lower this assembly into the oil pan. Remove the oil pan.

8. Installation is the reverse of the removal procedure. Tighten the oil pump pick-up tube assembly screws to 10–15 ft. lbs. Tighten the oil pan retaining bolts working from the center to the end after securing the corner bolts to 9–11 ft. lbs. Refill all fluid levels.

E Series**5.0L AND 5.8L ENGINES**

1. Disconnect the battery and remove engine (doghouse) cover. Remove the air cleaner. Drain the cooling system.

2. If equipped with power steering remove the pump and position it out of the way. If so equipped, remove the air conditioning compressor retainer and position the compressor out of the way.

3. Disconnect the radiator hoses. Remove the fan shroud bolts and oil filler tube. Remove the oil dipstick bolt. Raise and safely support the vehicle.

4. Remove the alternator splash shield. If equipped, disconnect the automatic transmission cooler lines at the radiator.

5. Disconnect and plug the fuel line at the fuel pump on vehicles equipped with a carburetor.

6. Remove the engine mount retaining nuts. Drain the engine oil. Remove the dipstick tube.

7. Disconnect the muffler inlet pipe from the exhaust manifolds.

8. If equipped, remove the automatic transmission dipstick and tube. Disconnect the manual linkage at the transmission. Remove the center driveshaft support and remove the

driveshaft (mark the position of the driveshaft for correct installation) from the transmission.

9. Place a transmission jack or equivalent under the oil pan and insert a wooden block between the pan and jack. The engine and transmission assembly will pivot around the rear engine mount. The engine assembly must be raised 4 inches (measured from the front motor mounts). The engine must remain centered in the engine compartment to obtain this much lift.

10. Raise the engine (make sure fan clutch assembly does not break radiator shroud) and transmission assembly. Insert wooden blocks to support the engine.

11. Remove the oil pan bolts and lower the oil pan. Remove the oil pump and the oil pickup tube and lay them in the oil pan. Remove the oil pan from the vehicle.

12. Installation is the reverse of the removal procedure. Tighten the oil pump pickup tube assembly screws to 10–15 ft. lbs. and oil pump retaining bolts to 22–32 ft. lbs. Tighten the oil pan retaining bolts working from the center to the end after securing the corner bolts to 9–11 ft. lbs. Refill all fluid levels and bleed cooling system.

E and F Series**6.9L AND 7.3L ENGINES**

1. Disconnect both battery ground cables.

2. Remove the engine oil dipstick and automatic transmission if so equipped level dipstick.

3. Remove the air cleaner and install intake opening cover or equivalent.

4. Remove the fan clutch assembly. A left hand thread is used to retain the fan clutch assembly.

5. Drain the cooling system and remove the automatic transmission cooling (cap lines after removal) lines if so equipped.

6. Disconnect the lower radiator hose. Remove the power steering return hose from the power steering pump.

7. Disconnect all electrical wiring at alternator.

8. Raise and safely support the vehicle.

9. Disconnect the fuel inlet line. Drain crankcase and remove the oil filter.

10. Remove the transmission filler tube assembly. Remove the front pipe from the exhaust manifold and muffler. Exhaust manifold upper right mounting stud may have to be removed to gain necessary clearance when motor is lifted.

11. Remove the attaching bolts at

No. 1 crossmember. Lower the vehicle.

12. Using a suitable engine sling or lifting hooks and a floor crane raise the engine until transmission housing contacts body.

13. Install wood blocks between engine mounts and crossmember. Lower engine onto blocks.

14. Raise and safely support the vehicle. Remove the flywheel inspection plate and position any fuel lines out of the way.

15. Remove oil pan retaining bolts. Remove oil pump and pickup tube from engine and lay in oil pan if necessary.

16. Remove the oil pan. Crankshaft may have to be turned to reposition counterweights to aid in removal of the oil pan.

17. Installation is the reverse of the removal procedure. Tighten the oil pump pickup tube assembly nut to 12–18 ft. lbs. Tighten the oil pan retaining bolts working from the center to the end after securing the corner bolts to 14 ft. lbs. Refill all fluid levels and bleed cooling system.

E Series**7.5L ENGINE**

1. Remove the engine (doghouse) cover, disconnect the battery and drain the cooling system.

2. Remove the air inlet tube and the air cleaner assembly. Disconnect the throttle and transmission linkage at the carburetor or throttle body. Disconnect the power brake vacuum lines.

3. Disconnect the fuel line, choke lines and remove the carburetor air cleaner adaptor from the carburetor. On fuel injected vehicles relieve the fuel pressure and remove fuel lines from the fuel rails. Disconnect air tubes at the throttle body.

4. Disconnect the radiator hoses. If equipped, disconnect the oil cooler lines. Remove the fan/shroud assembly and remove the radiator. If equipped, remove the power steering pump and position it aside.

5. Remove the front engine mount attaching bolts. Remove the engine oil dipstick tube from the exhaust manifold. Remove the oil filler tube and bracket.

6. If so equipped, rotate the air conditioning lines (at the rear of the compressor) down to clear the dash or remove them (evacuate the system as required).

7. Remove the upper intake manifold and throttle body as an assembly on fuel injected vehicles.

8. Raise and support the vehicle safely. Drain the crankcase and remove the oil filter.

9. Remove the muffler inlet pipe assembly. Disconnect the manual and

kickdown linkage from the transmission. Remove the driveshaft (mark for correct installation) and coupling shaft assembly. Remove the transmission tube assembly.

10. Remove the dipstick and tube from the oil pan. Place a transmission jack or equivalent under the engine oil pan. Insert a wood block between the jack surface and the oil pan. Jack the engine upward, pivoting on the rear mount until the transmission contacts the floor. Block the engine in position. The engine must remain centralized to obtain the maximum height. The engine must be raised 4 inches at the mounts to remove the oil pan.

11. Remove the oil pan bolts and lower the oil pan. Remove the oil pump and pick up tube attachments and drop them into the oil pan. Remove the oil pan rearward from the vehicle. The oil pump must be removed when removing the oil pan.

12. Installation is the reverse of the removal procedure. Tighten the oil pump pickup tube assembly nut to 12-18 ft. lbs. Tighten the oil pan retaining bolts working from the center to the end after securing the corner bolts to 14 ft. lbs. Refill all fluid levels and bleed cooling system.

F Series

7.5L ENGINE

1. Disconnect the battery ground cable. Disconnect the radiator shroud and position it over the fan.

2. Raise and support the vehicle. Drain the crankcase. Remove the oil

filter.

3. Remove the through bolt from each engine support. Place a floor jack under the front edge of the oil pan, with a block of wood between the jack and the oil pan. Raise the engine (make sure fan clutch assembly does not break radiator shroud) just high enough to insert blocks of wood between the insulators and the brackets. Remove the floor jack.

4. Remove the oil pan bolts and remove the oil pan. It may be necessary to rotate the crankshaft to provide clearance between the pan and the crankshaft counterweights.

5. Installation is the reverse of the removal procedure. Tighten the oil pump pick-up tube assembly screws to 12-18 ft. lbs. and nut to 22-32 ft. lbs. Tighten the oil pan retaining bolts working from the center to the end after securing the corner bolts to 8-11 ft. lbs. Refill all fluid levels.

Oil Pump

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable(s). Raise and safely support the vehicle. Drain the engine oil. Remove the oil pan.

2. Remove the oil pump mounting bolts and remove the oil pump from the cylinder block.

To install:

3. Prime the pump by filling the inlet port with new engine oil. Rotate the pump shaft to distribute oil within the

pump body. Install the distributor intermediate shaft in the oil pump rotor shaft.

4. Insert the intermediate shaft into the distributor shaft hex bore. Make certain that the intermediate shaft is properly seated. Do not force the pump into position if it will not seat readily. The intermediate shaft hex may be misaligned with the distributor shaft. To align, rotate the intermediate shaft until it can be seated.

NOTE: To align the distributor shaft use a long tool to turn the shaft to the proper position.

5. Install the oil pump to the cylinder block. Install the oil pan and other related parts.

CHECKING

Thoroughly clean all parts in solvent and dry with compressed air. Check the inside of the pump housing for obvious wear or scoring. Check mating surfaces of pump cover and rotors, replace the cover if it is scored or grooved.

Measure the inner rotor tip clearance. With the rotor assembly installed in the housing, place a straightedge over the rotor assembly and the housing. Measure the clearance (rotor endplay) between the straightedge and the rotor and outer race. Measure the driveshaft to housing clearance by comparing shaft outer diameter to housing bearing inner diameter. In-

Typical oil pump assembly-V8 engine

INNER TO OUTER ROTOR TIP CLEARANCE MUST NOT EXCEED (0.012 INCH) WITH FEELER GAUGE INSERTED (1/2") MINIMUM AND ROTORS REMOVED FROM PUMP HOUSING.

Checking Inner rotor tip clearance

Checking rotor endplay

spect relief valve spring for collapsed or worn condition. Check the spring tension. Check relief valve piston and bore for scores and free operation.

The inner to outer rotor tip clearance is 0.012 maximum and rotor assembly endplay clearance is 0.004 maximum. If any part of the oil pump requires replacement, replace the complete pump assembly.

Rear Main Oil Seal

REMOVAL & INSTALLATION

One Piece Seal

1. Disconnect the negative battery cable and remove the starter. Remove the transmission and on manual transmission equipped vehicles remove the clutch assembly.

2. Remove the flywheel. Lower the oil pan if necessary for working room.

3. Use an awl or equivalent to punch two small holes on opposite sides of the seal just above the split between the main bearing cap and engine block. Install a sheet metal screw in each hole. Use two small pry bars and pry evenly on both screws using 2 small blocks of wood as a fulcrum point for the pry bars. Use caution throughout to avoid scratching or damage to the oil seal mounting surfaces.

4. When the seal has been removed, clean the mounting recess.

5. Coat the seal and block mounting surfaces with oil. Apply white lube to the contact surface of the seal and crankshaft. Start the seal into the mounting recess and install with seal mounting tool.

6. Install the remaining components in the reverse.

Split Seal

1. Disconnect the negative battery cable. Remove the oil pan. Loosen all main bearing caps, lowering the crankshaft slightly, but not more than $\frac{1}{32}$ in.

2. Remove the rear main bearing cap.

3. Remove the seal halves from cap and block. Use a seal removing tool on the block half or install a small metal screw in one end so that the seal may be pulled out. Do not damage or scratch the crankshaft seal surfaces.

4. Thoroughly clean seal grooves in block and cap with brush and solvent. Dip seal halves in engine oil.

5. Carefully install upper half of seal with the lip facing toward the front of the engine until $\frac{3}{8}$ in. is left protruding below parting surface. Be careful not to scrape seal.

6. Tighten all but the rear main bearing caps to specified torque.

7. Install lower seal half in the rear main bearing cap with the lip facing toward the front of the engine. Apply a light coat of oil-resistant sealer to the rear of the top mating surface of the cap. Do not apply sealer to the area forward of the side seal groove.

8. Install rear main bearing cap and tighten bolts to specified torque.

9. Install oil pump and oil pan. Fill crankcase and operate engine to check for leaks.

Installing split-type crankshaft rear oil seal

Installing one-piece crankshaft rear oil seal

MANUAL TRANSMISSION

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

Transmission Assembly

REMOVAL & INSTALLATION

Ford 3.03 Three Speed

E SERIES

1. Raise and support the vehicle safely. Drain the lubricant from the transmission by removing the drain plug if the vehicle is so equipped. For models without drain plugs, remove the lower extension housing-to-transmission bolt.

2. Mark and disconnect the drive-shaft from the flange at the transmission. Secure the front end of the drive-shaft out of the way with mechanic's wire or equivalent.

3. Disconnect the speedometer cable from the extension housing and disconnect the gear shift rods from the transmission shift levers.

4. Position a transmission jack under the transmission. Secure the transmission to the jack.

5. Raise the transmission slightly and remove the bolts retaining the transmission support crossmember to the frame side rails. Remove the bolt retaining the transmission extension housing to the crossmember.

6. Remove the 4 transmission-to-flywheel housing bolts.

7. Position engine support bar tool T65E-6000-J or equivalent (floor jack) to the frame.

8. Lower the transmission.

To install:

9. Make certain that the machined surfaces of the transmission case and the flywheel housing are free of dirt, paint and burrs.

10. Install a guide pin in each lower mounting bolt hole.

11. Start the input shaft through the release bearing. Align the splines on the input shaft with the splines in the clutch disc. Move the transmission forward on the guide pins until the input shaft pilot enters the bearing or bushing in the crankshaft. If the transmission front bearing retainer binds up on

the clutch release bearing hub, work the release bearing lever until the hub slides onto the transmission front bearing retainer. Install the 2 transmission-to-flywheel housing upper mounting bolts and lockwashers. Remove the 2 guide pins and install the lower mounting bolts and lockwashers.

12. Raise the jack slightly and remove the engine support bar or equivalent.

13. Position the support crossmember on the frame side rails and install the retaining bolts. Install the extension housing-to-crossmember retaining bolt.

14. Connect the gear shift rods and the speedometer cable.

15. Install the driveshaft and torque the attaching bolts to 42–50 ft. lbs..

16. Fill the transmission to the bottom of the filler hole with the recommended lubricant.

17. Adjust the clutch pedal free travel and shift linkage as required.

F SERIES

1. Raise and support the vehicle safely. Support the engine with a jack and wood block placed under the oil pan.

2. Drain the transmission lubricant by removing the drain plug if the vehicle is so equipped. For models without drain plugs, remove the lower extension housing-to-transmission bolt.

3. Position a transmission jack un-

der the transmission.

4. Disconnect the gear shift linkage at the transmission. Mark and disconnect the driveshaft from the vehicle.

5. Disconnect the speedometer cable and reverse light wiring from the transmission.

6. Remove the transmission-to-clutch housing attaching bolts.

7. Move transmission to the rear until the input shaft clears the clutch housing and lower the transmission. Do not depress the clutch pedal while the transmission is removed.

8. Before installing the transmission, apply a light film of lubricant to the clutch disc splines, release bearing inner hub surfaces, release lever fulcrum and fork and the transmission front bearing retainer. Exercise care to avoid contaminating the clutch disc with excessive grease.

9. Place the transmission on a transmission jack. Raise the transmission until the input shaft splines are in line with the clutch disc splines. The clutch release bearing and hub must be properly positioned in the release lever fork.

10. Install a guide stud in each lower clutch housing-to-transmission case mounting bolt and align the splines on the input shaft with the splines on the clutch disc.

11. Slide the transmission forward on the guide studs until it contacts the clutch housing.

12. Install the 2 transmission to fly-

wheel housing upper mounting bolts and nuts. Remove the 2 guide studs and install the lower mounting bolts. Tighten all retaining bolts to 42–50 ft. lbs.

13. Connect the speedometer cable. Install the driveshaft.

14. Connect each shift rod to its respective lever on the transmission.

15. Fill the transmission to the proper level with an approved lubricant.

16. Adjust the clutch pedal free travel and shift linkage as required.

Warner T-18, T-19A and T-19C Four Speed

BRONCO AND F SERIES 4WD

1. Remove the shift knobs. Remove the transmission shift lever boot assembly.

2. Remove the screws holding the floor mat. Remove the screws holding the access cover to the floor pan. Place the shift lever in **R** and remove the cover.

3. Remove the insulator and the dust cover. Remove the transfer case shift lever. Remove the bolts holding the shift cover and the gasket.

4. Cover the shift cover opening to protect the transmission from dirt during the removal procedure.

5. Raise and support the vehicle safely. Drain the transmission.

6. Mark and disconnect the front and the rear driveshaft from the transfer case and wire them out of the way.

Warner T-18 manual transmission assembly

Remove the cotter pin that holds the shift link in place and remove the shift link.

7. Remove the speedometer cable from the transfer case. Position a transmission jack or equivalent under the transfer case. Remove the bolts holding the transfer case to the transmission and remove the transfer case from the vehicle.

8. Remove the bolts that hold the rear support bracket to the transmission.

9. Position a transmission jack under the transmission and remove the rear support bracket and brace. Remove the bolts that hold the transmission to the bell housing and remove the transmission.

10. To install, place the transmission on a transmission jack and install it in the vehicle. Install 2 guide pins in the bell housing top holes, to guide the transmission in place.

11. Install the 2 lower bolts, remove the guide pins and install the upper 2 bolts. Tighten all retaining bolts to 35-50 ft. lbs.

12. Continue the installation in the reverse order of the removal. Fill the transfer case and the transmission with lubricant as required. Lower the vehicle. Road test the vehicle for proper operation.

F SERIES 2WD

1. Remove the rubber boot, floor mat and the body floor pan cover and remove the transmission shift lever. Remove the weather pad and pad retainer.

2. Raise and support the vehicle safely. Position a transmission jack under the transmission and disconnect the speedometer cable.

3. Disconnect the back-up light switch assembly.

4. Mark and remove the driveshaft and clutch linkage.

5. Remove the transmission attaching bolts.

6. Move the transmission to the rear until the input shaft clears the clutch housing and lower the transmission.

NOTE: Before installing the transmission, apply a light film of lubricant to the clutch disc splines, release bearing inner hub surfaces, release lever fulcrum and fork and the transmission front bearing retainer. Care must be exercised to avoid excessive grease from contaminating the clutch disc.

7. Place the transmission on a transmission jack and raise the transmission until the input shaft splines are aligned with the clutch disc splines. The clutch release bearing and

Shifter boot assembly

hub must be properly positioned in the release lever fork.

8. Install guide studs in the clutch housing and slide the transmission forward on the guide studs until it is in position on the clutch housing. Install the attaching bolts and nuts. Remove the guide studs and install the 2 lower attaching bolts. Tighten all retaining bolts to 35-50 ft. lbs.

9. Connect the speedometer cable, electrical connection for reverse lights and shift linkage.

10. Install the driveshaft assembly.

11. Install the shift lever, boot and shift ball. Install the weather pad and pad retainer. Install the floor pan cover and floor mat.

12. Road test the vehicle for proper operation.

New Process 435 Four Speed BRONCO AND F SERIES 2WD AND 4WD

1. Remove the floor mat. Remove the shift lever, boot and ball as an assembly. On 4WD vehicles remove the transfer case shift lever, boot and ball as an assembly.

2. Remove the floor pan transmission cover plate. It may be necessary first to remove the seat assembly.

3. Remove the gearshift lever assembly from the housing. Disconnect the back-up light switch located in the rear of the gearshift housing cover.

4. Raise and support the vehicle safely. Position a transmission jack under the transmission and disconnect the speedometer cable. Mark and remove the driveshaft from the vehicle.

5. On 4WD applications drain the transfer case. Remove the front driveshaft and shift link assembly. Remove the speedometer cable from the transfer case and support bracket. Remove the transfer case from the vehicle.

6. Remove the 2 transmission up-

per mounting nuts at the clutch housing.

7. Remove the transmission attaching bolts at the clutch housing and remove the transmission.

8. Before installing the transmission, apply a light film of lubricant to the clutch disc splines, release bearing inner hub surfaces, release lever fulcrum and fork and the transmission front bearing retainer. Care must be exercised to avoid excessive grease from contaminating the clutch disc.

9. Place the transmission on a transmission jack and raise the transmission until the input shaft splines are aligned with the clutch disc splines. The clutch release bearing and hub must be properly positioned in the release lever fork.

10. Install guide studs in the clutch housing and slide the transmission forward on the guide studs until it is in position on the clutch housing. Install the attaching bolts and nuts. Remove the guide studs and install the 2 lower attaching bolts. Tighten all retaining bolts to 35-50 ft. lbs.

11. On 4WD applications install the transfer case to the vehicle. Install the front driveshaft and shift link assembly. Install the speedometer cable to the transfer case and support bracket.

12. Install the driveshaft and reconnect the speedometer cable.

13. Install the gearshift lever assembly. Reconnect the back-up light switch. Install the floor pan transmission cover plate. Install the seat assembly as necessary.

14. Install the floor mat. Install the shift lever, boot and ball as an assembly. On 4WD vehicles install the transfer case shift lever, boot and ball as an assembly.

15. Fill transmission and transfer case as required. Road test for proper operation.

Top Mounted Shifter Overdrive Transmission

F SERIES 2WD

1. Raise and support the vehicle safely. Mark the driveshaft so that it may be installed in the same position. Disconnect the driveshaft from the U-joint flange. Slide the driveshaft off the transmission output shaft and install the extension housing seal installation tool into the extension housing to prevent the transmission lubricant from leaking out.

2. Disconnect the speedometer cable at the extension housing. Remove the retaining clips, flat washers and

Top mounted shifter-manual transmission

spring washers that secure the shift rods to the shift levers. Remove the bolts connecting the shift control to the transmission extension housing. Remove the nut connecting the shift control to the transmission case.

3. Disconnect the back-up lamp switch and high gear switch if so equipped electrical connections.

4. Remove the rear transmission support connecting bolts attaching the support on the crossmember to the transmission extension housing. Support the engine with a transmission jack and remove the extension housing-to-engine rear support attaching bolts.

5. Raise the rear of the engine high enough to relieve the weight from the crossmember. Remove the bolts retaining the crossmember to the frame side supports and remove the crossmember.

6. Support the transmission on a jack and remove the transmission-to-flywheel housing bolts. Move the transmission and the jack rearward until the transmission input shaft clears the flywheel housing. Lower the engine enough to obtain clearance for transmission removal and remove the unit.

7. To install, make sure that the mounting surfaces of the transmission and the flywheel housing are free of dirt, paint and burrs. Install 2 guide pins in the flywheel housing lower mounting bolt holes. Move the transmission forward on the guide pins until the input shaft splines enter the clutch hub splines and the case is positioned against the flywheel housing.

8. Install the 2 upper transmission mounting bolts, remove the guide pins and install the lower mounting bolts. Tighten all retaining bolts to 35-50 ft. lbs.

9. Continue the installation in the reverse order of the removal. Fill the transmission to the proper level with lubricant. Lower the vehicle. Road test and check the shift and crossover motion for full shift engagement and smooth crossover operation.

BRONCO AND F SERIES 4WD

1. Raise and support the vehicle safely.

2. Drain the transfer case. Disconnect the back-up light and 4WD indicator light electrical connections from the transfer case.

3. Remove the transfer case assembly from the transfer adapter. Slide the transfer case rearward of the transmission output shaft.

4. Support the transmission remove the transmission retaining bolts.

5. Move the transmission and the jack rearward until the transmission input shaft clears the flywheel hous-

ing. Lower the engine enough to obtain clearance for transmission removal and remove the unit.

6. Installation is the reverse of the removal procedure. Tighten the transmission retaining bolts 35-50 ft. lbs.

Four Speed Overdrive

E SERIES

1. Raise and support the vehicle safely. Mark the driveshaft so that it may be installed in the same position. Disconnect the driveshaft from the U-joint flange. Slide the driveshaft off the transmission output shaft and install the extension housing seal installation tool or equivalent into the extension housing to prevent the transmission lubricant from leaking out.

2. Disconnect the speedometer cable at the extension housing. Remove the retaining clips, flat washers and spring washers that secure the shift rods to the shift levers. Remove the bolts connecting the shift control to the transmission extension housing. Remove the nut connecting the shift control to the transmission case.

3. Remove the rear transmission support connecting bolts attaching the support on the crossmember to the transmission extension housing. Support the engine with a transmission jack and remove the extension housing-to-engine rear support attaching bolts.

4. Raise the rear of the engine high enough to relieve the weight from the crossmember. Remove the bolts retaining the crossmember to the frame side supports and remove the crossmember.

5. Support the transmission on a jack and remove the transmission-to-flywheel housing bolts. Move the transmission and the jack rearward until the transmission input shaft clears the flywheel housing. Lower the engine enough to obtain clearance for transmission removal and remove the unit.

NOTE: Do not depress the clutch pedal while the transmission is removed.

6. To install, make sure that the mounting surfaces of the transmission and the flywheel housing are free of dirt, paint and burrs. Install two guide pins in the flywheel housing lower mounting bolt holes. Move the transmission forward on the guide pins until the input shaft splines enter the clutch hub splines and the case is positioned against the flywheel housing.

7. Install the two upper transmission mounting bolts, remove the guide pins and install the lower mounting bolts. Tighten the transmission retaining bolts to 35-50 ft. lbs.

8. Continue the installation in the reverse order of the removal.

9. Fill the transmission to the proper level with lubricant. Lower the vehicle. Check the shift and crossover motion for full shift engagement and smooth crossover operation.

Mazda M50D Five Speed

BRONCO, F AND E SERIES 2WD

1. Shift the transmission into the N position. Disconnect the negative battery cable.

2. Remove the carpet or floor mat. Remove the shifter boot retainer screws and slide the boot up the shift lever shaft. Remove the shift lever retaining bolt and remove the shift lever.

3. Raise and support the vehicle safely. Disconnect the speedometer cable. Disconnect the backup lamp switch located at the top left hand side of the transmission.

4. Remove the drain plug from the transmission and drain the transmission fluid into a suitable drain pan. Position a suitable transmission jack under the transmission.

5. Disconnect the driveshaft from the transmission and wire it to one side. Disconnect the clutch hydraulic line.

6. Remove the transmission rear insulator and lower retainer. Remove the crossmember.

7. Remove the bolts that retain the transmission to the engine block. Move the transmission to the rear until the input shaft clears the engine flywheel. Lower the transmission from the vehicle.

8. With the transmission on a suitable transmission jack, install the guide studs into the engine block and raise the transmission up until the input shaft splines are aligned with the clutch disc splines.

9. Slide the transmission forward onto the guide studs until the transmission is in the correct position. Install the transmission retaining bolts and torque to 40-50 ft. lbs.

10. Installation is the reverse of the removal procedure. Fill the transmission to the proper level with lubricant. Lower the vehicle. Check the shift and crossover motion for full shift engagement and smooth crossover operation.

BRONCO, F AND E SERIES 4WD

1. Shift the transmission into the N position. Disconnect the negative battery cable.

2. Remove the carpet or floor mat. Remove the shifter boot retainer screws and slide the boot up the shift lever shaft. Remove the shift lever retaining bolt and remove the shift lever.

3. Raise and support the vehicle safely. Disconnect the driveshaft from

the transmission and wire it to one side.

4. Disconnect the front driveshaft from the transfer case and wire it out of the way.

5. Disconnect the speedometer cable. Disconnect the backup lamp switch located at the top left hand side of the transmission. If equipped, remove the skid pad from underneath the transfer case.

6. Remove the drain plug from the transmission and drain the transmission fluid into a suitable drain pan. Position a suitable transmission jack under the transmission.

7. Support the transfer case, using a suitable transmission jack or equivalent. Remove the 6 bolts holding the transfer case to the transmission and carefully lower the transfer case from the vehicle, using care to ensure that the transfer case shift lever clears the opening in the floor pan.

8. Remove the transmission rear insulator and lower retainer. Remove the crossmember.

9. Remove the bolts that retain the transmission to the engine block. Move the transmission to the rear until the input shaft clears the engine flywheel. Lower the transmission from the vehicle.

10. With the transmission on a suitable transmission jack, install the guide studs into the engine block and raise the transmission up until the input shaft splines are aligned with the clutch disc splines.

11. Slide the transmission forward onto the guide studs until the transmission is in the correct position. Install the transmission retaining bolts and torque to 40-50 ft. lbs.

12. Place the rear support bracket in position and install the retaining bolts. Install the crossmember. Position the insulator between the transmission and crossmember. Remove the transmission jack.

13. Position the transfer case on the transmission jack. Position the transfer case onto the transmission, using care to guide the transfer case shift lever through the opening in the floor pan. Install the gasket and 6 retaining bolts 24-34 ft. lbs.

14. Connect the speedometer cable and driven gear. Connect the backup lamp switch.

15. Install the driveshaft to the transmission.

16. Connect the rear driveshaft to the transfer case. Fill the transmission with the recommended transmission fluid to the proper level. Lower the vehicle.

17. Install the shift lever retaining bolt and tighten the retaining bolts. Slide the shifter boot into position on the shifter shaft and install the boot

retaining screws.

18. Install the isolator pad assembly. Install the floor pan cover and floor mat. Install the shift ball on the transfer case shift lever.

S5-42 ZF Five Speed

BRONCO, F AND E SERIES 2WD

1. Shift the transmission into the N position. Disconnect the negative battery cable.

2. Remove the carpet or floor mat. Remove the ball from the upper shift lever. Remove the boot and bezel from the transmission. Remove the upper shift lever from the lower shift lever.

3. Raise and support the vehicle safely. Disconnect the speedometer cable. Disconnect the backup lamp switch located at the top left hand side of the transmission.

4. Remove the drain plug from the transmission and drain the transmission fluid into a suitable drain pan. Position a suitable transmission jack under the transmission.

5. Disconnect the driveshaft from the transmission and wire it to one side. Disconnect the clutch hydraulic line.

6. On some applications, remove

the parking brake from the transmission.

7. Remove the transmission rear insulator and lower retainer. Remove the crossmember.

8. Remove the bolts that retain the transmission to the engine block. Move the transmission to the rear until the input shaft clears the engine flywheel. Lower the transmission from the vehicle.

9. With the transmission on a suitable transmission jack, install the guide studs into the engine block and raise the transmission up until the input shaft splines are aligned with the clutch disc splines.

10. Slide the transmission forward onto the guide studs until the transmission is in the correct position. Install the transmission retaining bolts and torque to 40-50 ft. lbs.

11. Installation is the reverse of the removal procedure. Fill the transmission to the proper level with lubricant. Lower the vehicle. Check the shift and crossover motion for full shift engagement and smooth crossover operation.

BRONCO, F AND E SERIES 4WD

1. Shift the transmission into the N

ZF S5-42 TRANSMISSION - 4 x 4 AND F-SUPER DUTY VERSION

ZFS 5-42 TRANSMISSION - 4 x 2 VERSION

S5-42 ZF-manual transmission assembly

position. Disconnect the negative battery cable.

2. Remove the carpet or floor mat. Remove the ball from the upper shift lever. Remove the boot and bezel from the transmission. Remove the upper shift lever from the lower shift lever.

3. Raise and support the vehicle safely. Disconnect the driveshaft from the transmission and wire it to one side.

4. Disconnect the front driveshaft from the transfer case and wire it out of the way.

5. Disconnect the speedometer cable. Disconnect the backup lamp switch located at the top left hand side of the transmission. If equipped, remove the skid pad from underneath the transfer case.

6. Remove the drain plug from the transmission and drain the transmission fluid into a suitable drain pan. Position a suitable transmission jack under the transmission.

7. Support the transfer case, using a suitable transmission jack or equivalent. Remove the 6 bolts holding the transfer case to the transmission and carefully lower the transfer case from the vehicle, using care to ensure that the transfer case shift lever clears the opening in the floor pan.

8. Remove the transmission rear insulator and lower retainer. Remove the crossmember.

9. Remove the bolts that retain the transmission to the engine block. Move the transmission to the rear until the input shaft clears the engine flywheel. Lower the transmission from the vehicle.

10. With the transmission on a suitable transmission jack, install the guide studs into the engine block and raise the transmission up until the input shaft splines are aligned with the clutch disc splines.

11. Slide the transmission forward onto the guide studs until the transmission is in the correct position. Install the transmission retaining bolts and torque to 40-50 ft. lbs.

12. Place the rear support bracket in position and install the retaining bolts. Install the crossmember. Position the insulator between the transmission and crossmember. Remove the transmission jack.

13. Position the transfer case on the transmission jack. Position the transfer case onto the transmission, using care to guide the transfer case shift lever through the opening in the floor pan. Install the gasket and 6 retaining bolts 24-34 ft. lbs.

14. Connect the speedometer cable and driven gear. Connect the backup lamp switch.

15. Install the driveshaft to the transmission. Connect the rear drive-

Linkage adjustment—four speed overdrive

shaft to the transfer case. Fill the transmission with the recommended transmission fluid to the proper level. Lower the vehicle.

16. Install the shift lever retaining bolt and tighten the retaining bolts. Slide the shifter boot into position on the shifter shaft and install the boot retaining screws.

17. Install the isolator pad assembly. Install the floor pan cover and floor mat. Install the shift ball on the transfer case shift lever.

18. Road test the vehicle for proper shift operation.

LINKAGE ADJUSTMENT

Ford 3.03 Three Speed

NOTE: Always use new retaining rings and insulators when making linkage adjustments. The plastic grommets should be replaced when excessive wear or looseness is noted shift linkage.

1. Place the shifter in the N position and insert a gauge pin ($\frac{3}{16}$ in. diameter) through the locating hole in the steering column shift levers and the plastic spacer.

2. If the shift rods at the transmission are equipped with threaded sleeves, adjust the sleeves so that they enter the shift levers on the transmission easily with the shift levers in the N position. Now lengthen the rods 7 turns of the sleeves and insert them into the shift levers.

3. If the shift rods are slotted, loosen the attaching nut, make sure that the transmission shift levers are in the N position, then retighten the attaching nuts.

4. Remove the gauge pin and check the operation of the shift linkage.

Four Speed Overdrive

1. Disconnect the 3 shift rods from the shifter assembly.

2. Insert a $\frac{1}{4}$ in. diameter pin through the alignment hole in the

Linkage adjustment—Ford 3.03 transmission

shifter assembly. Make sure the levers are in the N position.

3. Align the 3 transmission levers as follows: forward lever (3rd–4th lever) in the mid-position (neutral), rearward lever (1st–2nd lever) in the mid-position (neutral) and middle lever (reverse lever) rotate counterclockwise to the neutral position.

4. Rotate the output shaft to assure that the transmission is in neutral.

5. Shift the reverse lever (middle) clockwise to the reverse position. This causes the interlock system to align 1–2 and 3–4 rails in the neutral position.

6. Position the 1–2 and 3–4 shift rods to the correct transmission levers. Install and tighten the locknuts to 15–20 ft. lbs.

7. Rotate the reverse lever counter-

clockwise back to the neutral position. Install the reverse shift rod and tighten the locknut to 15–20 ft. lbs.

8. Remove the alignment pin. Check for proper operation.

CLUTCH

Clutch Assembly

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Raise and safely support the vehicle. Remove clutch slave cylinder or

the hydraulic line as necessary.

2. Remove the dust cover and clutch release lever if so equipped.

3. Remove the transmission from the vehicle.

4. Mark the pressure plate and cover assembly and the flywheel, so that the parts can be reinstalled in the same position.

5. Loosen the pressure plate attaching bolts evenly and remove the clutch/pressure plate assembly. Do not remove the pilot bearing unless it is to be replaced.

To install:

6. Position the disc on the flywheel and install a pilot tool or spare transmission spline shaft.

7. Install the pressure plate assembly over the aligning tool and align the specifications. On a 10 in. clutch plate assembly tighten the retaining bolts to 15–20 ft. lbs. On a 11 inch clutch plate assembly tighten the retaining bolts to 20–29 ft. lbs.

8. Remove pilot tool and apply a light coat of lithium-base grease to the hub splines of the clutch disc.

9. Install the release lever onto the pivot stud if so equipped. Push inward to the lever snaps into position.

NOTE: Some vehicles use a concentric slave cylinder/release bearing assembly. This assembly is installed on the transmission input shaft.

10. Reinstall the manual transmis-

Clutch installation with concentric slave cylinder—E series, F series and Bronco—4.9L, 5.0L and 5.8L engines

Clutch Installation—F series and Bronco—4.9L and 5.0L engines

Clutch Installation—F series—7.3L and 7.5L engines

sion. Install the clutch slave cylinder or the hydraulic line as necessary.

11. Connect negative battery cable and bleed the hydraulic system. Road test the vehicle for proper operation.

PEDAL HEIGHT/FREE PLAY ADJUSTMENT

The hydraulic clutch system provides automatic adjustment. No adjustment of clutch linkage or pedal position is required.

Clutch Master Cylinder

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Disconnect the master cylinder pushrod by prying the retainer bushing and the pushrod off the shaft. Disconnect any electrical connection.

2. Remove the line to the slave cylinder and plug the line to prevent entry of dirt.

3. Remove the master cylinder and reservoir from the engine compartment (rotate assembly as necessary).

4. Install in the reverse order of removal procedure. Bleed the hydraulic system.

Clutch Slave Cylinder

REMOVAL & INSTALLATION

External Type

NOTE: For vehicles equipped with external slave cylinders, prior to any vehicle service that requires removal of the slave cylinder, the master cylinder pushrod must be disconnected from the clutch pedal. If not disconnected, permanent damage to the slave

Bleeding external slave cylinder

cylinder will occur if the clutch pedal is depressed while the slave cylinder is disconnected.

1. On the 6.9L, 7.3L and the 7.5L engines, lift the retaining tabs of the slave cylinder retaining bracket. Disengage the tabs from the bell housing lugs and slide outward to remove.

2. On the 4.9L, 5.0L and 5.8L engines remove the C-clip from the slave cylinder. Disengage the pushrod from the release lever as the slave cylinder is removed. Remove the slave cylinder.

3. Install in the reverse order. Bleed the hydraulic system.

Concentric Type

1. Disconnect the negative battery cable. Disconnect the hydraulic line.

2. Remove the transmission from the vehicle.

3. Remove the bolts retaining the

slave cylinder to transmission. Remove the slave cylinder from the transmission input shaft.

4. Installation is the reverse of the removal procedure. Tighten the slave cylinder retaining bolts to 15-20 ft. lbs. Bleed the hydraulic system.

BLEEDING THE HYDRAULIC SYSTEM

External Type

1. Clean reservoir cap. Remove the slave cylinder from the transmission bell housing.

2. Using a suitable punch drive out the pin that holds the tube. Remove the tube from the slave cylinder and place the tube into a container.

3. Hold the slave cylinder assembly so that the connector port is at the highest point. Fill the cylinder with brake fluid through connector port. It may be necessary to shake the cylinder while gently pushing on pushrod to expel air. When all the air is expelled reinstall the slave cylinder to the vehicle.

4. Gravity fill the clutch master cylinder and tube. Install end of tube into the slave cylinder body.

BOX END
WRENCH

BLEED
SCREW

bleeding the concentric slave cylinder

REMOVAL

INSTALLATION

Clutch release bearing removal-concentric slave cylinder

5. Check fluid level add the specified fluid as required.

Concentric Type

1. Clean reservoir cap. Fill reservoir to the top with approved brake fluid.
2. Loosen the bleed screw (located in the slave cylinder body).
3. Depress the clutch pedal to the floor and hold for 2 seconds. Release the pedal. Repeat 10 times.
4. Check fluid level add the specified fluid as required.

AUTOMATIC TRANSMISSION

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

Transmission Assembly

REMOVAL & INSTALLATION

C5

F SERIES

1. Disconnect the negative battery cable. Raise and support the vehicle safely. Remove the transmission fluid filler tube from the pan. Drain the transmission fluid.
2. At the front lower edge of the converter housing, remove the cover attaching bolts and remove the dust cover. Remove the splash shield at the control levers.
3. Mark and remove the driveshaft. Remove the converter drain plug. Allow the converter to drain and install the drain plug.
4. Disconnect the oil cooler lines from the transmission.
5. Disconnect the manual and downshift linkage rods from the transmission control levers.
6. Remove the speedometer gear from the extension housing.
7. Remove the 4 converter to flywheel attaching nuts. Disconnect the starter cable. Remove the 3 starter to converter housing attaching bolts. Remove the starter.
8. Disconnect the vacuum line from the diaphragm unit and the vacuum line retaining clip.
9. Position the transmission jack to support the transmission. Install the safety chain to hold the transmission on the jack.
10. Remove the engine rear support

crossmember-to-frame attaching bolts.

11. Remove the engine rear support-to-extension housing attaching bolts.
12. Raise the transmission and remove the rear support. Remove the converter housing-to-engine attaching bolts.
13. Move the transmission away from the engine. Lower the transmission and remove it from under the vehicle.

To install:

14. Secure the transmission on a transmission jack. Align the transmission with the engine and move it into place, using care not to damage the flywheel and the converter pilot.

NOTE: The converter must rest squarely against the flywheel. This indicates that the converter pilot is not binding in the crankshaft.

15. Install the converter housing-to-engine attaching bolts and torque to 40-50 ft. lbs. Install the converter-to-flywheel attaching nuts torque to 20-34 ft. lbs.

16. Install the rear support. Install the rear support-to-extension housing attaching bolts.

17. Position the starter into the converter housing and install the attaching bolts. Install the starter cable.

18. Remove the transmission jack.
19. Connect the transmission filler tube to the transmission pan. Connect the oil coolers lines to the transmission.

20. Install the speedometer driven gear in the extension housing.

21. Connect the transmission linkage rods to the transmission control levers.

NOTE: When making transmission control attachments, new retaining rings and grommets should be used.

22. Install the driveshaft.
23. Install the vacuum line in the retaining clip. Connect the vacuum line to the diaphragm unit.
24. At the front lower area of the converter housing, install the lower cover and the control lever dust shield. Install the attaching bolts.
25. Secure the fluid filler tube to the pan.
26. Lower the vehicle and reconnect the negative battery cable.
27. Fill the transmission to the proper level.
28. Raise the vehicle and check for transmission fluid leakage. Lower the vehicle and adjust the throttle and manual linkage.

C6

BRONCO AND F SERIES

1. Disconnect the negative battery cable. Raise and support the vehicle safely.
 2. Remove the converter housing-to-engine bolts.
 3. Remove the bolt securing the fluid filler tube to the engine cylinder head.
 4. Drain the fluid from the transmission and converter.
 5. Disconnect the coupling shaft (4WD applications) or driveshaft from the transmission companion flange and position it out of the way.
 6. Disconnect the speedometer cable from the bearing retainer.
 7. Disconnect the throttle and manual linkage rods from the levers at the transmission and all electrical connections if so equipped.
 8. Disconnect the oil cooler lines from the transmission.
 9. Remove the vacuum hose from the vacuum unit. Remove the vacuum line retaining clip.
 10. Disconnect the cable from the terminal on the starter motor. Remove the attaching bolts and remove the starter motor.
 11. Remove the 4 flywheel attaching nuts. Place a wrench on the crankshaft pulley attaching bolt to turn the converter to gain access to the nuts.
 12. Drain and remove the transfer case, if equipped.
 13. Remove the engine rear support crossmember-to-frame attaching bolts.
 14. Remove the engine rear support-to-extension housing attaching bolts.
 15. Remove the bolts securing the No. 2 crossmember to the frame side rails.
 16. Raise the transmission with a transmission jack and remove both crossmembers.
 17. Secure the transmission to the jack with the safety chain.
 18. Remove the remaining converter housing-to-engine attaching bolts.
 19. Move the transmission away from the engine. Lower the transmission and remove it from under the vehicle.
- To install:**
20. Tighten the converter drain plug. Position the converter on the transmission making sure the converter drive flats are fully engaged in the pump gear.
 21. With the converter properly installed, place the transmission on the jack. Secure the unit to the jack with a chain.
 22. Rotate the converter so that studs and drain plug are in alignment with those in the flywheel.
 23. Move the transmission toward

3 FORD FULL SIZE BRONCO • PICK-UP • VAN

the cylinder block until they are in contact.

NOTE: The converter must rest squarely against the flywheel. This indicates that the converter pilot is not binding in the engine crankshaft.

24. Install the converter housing-to-engine bolts. On gasoline engines tighten the the retaining bolts to 40-

50 ft. lbs. On diesel engines tighten the retaining bolts to 50-65 ft. lbs.

25. Remove the transmission jack safety chain from around the transmission.

26. Position the No. 2 crossmember to the frame side rails. Install the attaching bolts.

27. If equipped, install the transfer case.

28. Position the engine rear support

crossmember to the frame side rails. Install the rear support to extension housing mounting bolts.

29. Lower the transmission and remove the jack.

30. Secure the engine rear support crossmember to the frame side rails with the attaching bolts.

31. Connect the vacuum line to the vacuum diaphragm making sure that the metal tube is secured in the retain-

Typical crossmember installation

ing clip.

32. Connect the oil cooler lines to the transmission.

33. Connect the throttle and manual linkage rods to their respective levers on the transmission and all electrical connections.

34. Connect the speedometer cable to the bearing retainer.

35. Secure the starter motor in place with the attaching bolts. Connect the cable to the terminal on the starter.

36. Install a new O-ring on the lower end of the transmission filler tube and insert the tube in the case.

37. Secure the converter-to-flywheel attaching nuts. Use a wrench on the crankshaft pulley attaching nut to rotate the flywheel. Do not use a wrench on the converter attaching nuts to rotate it.

38. Install the converter housing dust shield and secure it with the attaching bolts.

39. Connect the coupling shaft (4WD applications) or driveshaft.

40. Adjust the shift linkage.

41. Install the transmission fluid filler tube to the cylinder head and secure with the attaching bolt. Lower the vehicle.

43. Fill the transmission and transfer case if so equipped to the correct level with the specified lubricant. Start the engine and shift the transmission through all ranges, then re-check the fluid level.

E SERIES

1. Disconnect the negative battery cable. Remove the engine (doghouse) cove from inside the vehicle.

2. Disconnect the neutral start wires at the plug connector.

3. If the vehicle is equipped with V8 engine, remove the flex hose from the air cleaner heat tube.

4. Remove the upper converter housing to engine attaching bolts. Remove the bolt securing the filler tube to the engine.

5. Raise the vehicle and support it safely.

6. Drain the transmission fluid pan loosening the bolts from the rear first and work toward the front of the pan.

7. Remove the converter cover from the flywheel housing.

8. Remove the converter to flywheel attaching nuts. Use a wrench on the crankshaft pulley bolt to turn the converter to gain access to the nuts then turn the converter to gain access to the drain plug and drain the converter.

9. Disconnect the driveshaft. Remove the fluid filler tube.

10. Disconnect the starter cable at the starter and remove the starter from the converter housing.

11. Disconnect the cooler lines from

the transmission. Disconnect the vacuum line from the modulator.

12. Remove the speedometer driven gear from the extension housing.

13. Disconnect the manual and downshift linkage rods or cable from the control levers.

14. Support the engine. Position a jack under the transmission. Install the safety chain to hold the transmission.

15. Remove the bolts and nuts securing the rear mount to the crossmember. Disconnect the crossmember from the side rails. Raise the transmission with the jack and remove the crossmember.

16. Remove the remaining converter housing to engine attaching bolts. Lower the jack and remove the converter and transmission assembly from under the vehicle.

17. Install in the reverse order of removal procedure. On gasoline engines tighten the retaining bolts to 40–50 ft. lbs. On diesel engines tighten the retaining bolts to 50–65 ft. lbs.

18. Adjust shift linkage as required. Fill the transmission to the correct level with the specified lubricant. Start the engine and shift the transmission through all ranges, then re-check the fluid level.

AOD

BRONCO, F AND E SERIES

1. Disconnect the negative battery cable. On E series remove the engine (doghouse) cover. Raise the vehicle and support it safely.

2. Place the drain pan under the transmission fluid pan. Starting at the rear of the pan and working toward the front, loosen the attaching bolts and allow the fluid to drain. Finally remove all of the pan attaching bolts except 2 at the front, to allow the fluid to further drain. With fluid drained, install 2 bolts on the rear side of the pan to temporarily hold it in place.

3. Remove the converter drain plug access cover from the lower end of the converter housing.

4. Remove the converter-to-flywheel attaching nuts. Place a wrench on the crankshaft pulley attaching bolt to turn the converter to gain access to the nuts.

5. Place a drain pan under the converter to catch the fluid. With the wrench on the crankshaft pulley attaching bolt, turn the converter to gain access to the converter drain plug and remove the plug. After the fluid has been drained, reinstall the plug.

6. Mark and disconnect (for proper installation) the driveshaft from the rear axle and slide shaft rearward from the transmission. Install a seal installation tool or equivalent in the

extension housing to prevent fluid leakage.

7. Disconnect the cable from the terminal on the starter motor. Remove the attaching bolts and remove the starter motor. Disconnect the neutral start switch wires at the plug connector.

8. Remove the rear mount-to-crossmember attaching bolts and the crossmember-to-frame attaching bolts.

9. Remove the engine rear support-to-extension housing attaching bolts.

10. Disconnect the TV linkage rod from the transmission TV lever. Disconnect the manual rod from the transmission manual lever at the transmission.

11. Remove the bolts securing the bellcrank bracket to the converter housing.

12. On 4WD vehicles, drain and remove the transfer case from the vehicle.

13. Raise the transmission with a transmission jack to provide clearance to remove the crossmember. Remove the rear mount from the crossmember and remove the crossmember from the side supports.

14. Lower the transmission to gain access to the oil cooler lines.

15. Disconnect each oil line from the fittings on the transmission.

16. Disconnect the speedometer cable from the extension housing.

17. Remove the bolt that secures the transmission fluid filler tube to the cylinder block. Lift the filler tube and the dipstick from the transmission.

18. Secure the transmission to the jack with the chain.

19. Remove the converter housing-to-cylinder block attaching bolts.

20. Carefully move the transmission and converter assembly away from the engine and, at the same time, lower the jack to clear the underside of the vehicle.

21. Remove the converter and tighten the converter drain plug.

22. Position the converter on the transmission, making sure the converter drive flats are fully engaged in the pump gear by rotating the converter.

23. With the converter properly installed, place the transmission on the jack. Secure the transmission to the jack with a chain.

24. Rotate the converter until the studs and drain plug are in alignment with the holes in the flywheel.

25. Move the converter and transmission assembly forward into position, using care not to damage the flywheel and the converter pilot. The converter must rest squarely against the flywheel. This indicates that the converter pilot is not binding in the engine crankshaft.

26. Install and tighten the converter housing-to-engine attaching bolts to 40–50 ft. lbs. The remainder of the installation is the reverse of the removal procedure.

27. Adjust the shift and throttle linkage as required. Fill the transmission to the correct level. Start the engine and shift the transmission through all ranges, then re-check the fluid level.

E4OD

BRONCO, F AND E SERIES

1. Disconnect negative battery cable at the battery. Remove the transmission dipstick. On E series remove the engine (doghouse) cover.

2. Place transmission selector in N position. Raise and safely support the vehicle.

3. On 4WD models, remove the front driveshaft. Remove the rear driveshaft. On F-Super Duty vehicles, remove the transmission mounted parking brake.

4. Disconnect the shift linkage. On 4WD model, remove the shift linkage from transfer case shift lever.

5. Remove the manual lever position sensor connector by squeezing connector tabs and pulling on connector.

NOTE: Do not attempt to pry tab with pry bar. Remove the heat shield from the transmission before attempting to remove the connector.

6. Remove the solenoid body connector heat shield.

7. Remove the solenoid body connector by pushing on the center tab and pulling on the wire harness.

8. On 4WD models, remove the 4WD drive switch connector from the transfer case. Use care not to overextend tabs.

9. Remove the wire harness locator from the extension housing wire bracket. On 4WD models, remove the wire harness locators from left hand side of the crossmember.

10. Remove the speedometer cable and the lower converter bolts.

11. Remove the rear engine cover plate bolts. Remove the starter.

12. Using a $\frac{15}{16}$ socket or equivalent, rotate the crankshaft bolt to gain access to converter nuts. Remove the 4 converter mounting nuts and discard the nuts.

13. Place a transmission stand fixture tool 014-00763 or equivalent on a universal transmission jack and position under the transmission. Use a safety strap to secure the transmission to the transmission stand fixture.

14. Loosen the 2 rear transmission mounting pad nuts. Remove the retaining bolts and remove the crossmember from the transmission.

15. Remove the transmission cooling lines from the case. Cap cooling lines and plug fittings at transmission.

16. Remove the 6 bell housing bolts. Back out the converter pilot from the flywheel and gently lower the transmission while observing for obstructions.

17. Install torque converter handles, T81P-8902-C or equivalent on the

converter with handles in the 6 and 12 o'clock positions.

18. Remove the transmission filler tube. On 4WD models, remove the transfer case vent hose form detent bracket and the transfer case from the transmission. On F-Super Duty models, remove the transmission mounted parking brake.

19. Place the transmission onto a transmission stand fixture tool 014-4763 or equivalent.

20. On 4WD models, install the transfer case to transmission. On F-Super Duty models, install transmission mounted parking brake.

21. Install the torque converter using torque converter handles T81P-7902-C or the equivalent. Carry the converter with the handles in the 6 and 12 o'clock positions. Push and rotate the converter onto the pump until it bottoms out.

NOTE: Check the seating of the converter by placing a straight-edge across the bell housing. There must be a gap between the converter pilot face and the straightedge.

22. Remove the converter handles. Check the condition of filler tube O-ring, if damaged or worn replace the O-ring. Install the filler tube.

23. Rotate the converter studs to align with flywheel mounting holes. Raise transmission into position while observing for any obstructions. Do not allow converter drive flats to disengage from pump gear. Use rubber converter drain plug cover or equivalent to aid in the alignment of the converter studs.

NOTE: Use care not to damage the flywheel and convert pilot. The converter must rest squarely against the flywheel. This indicates that the converter pilot is not binding in the engine crankshaft.

24. Alternately snug up the bell housing bolts and final torque to 40–50 ft. lbs.

25. Install the rubber converter drain plug cover and transmission cooling lines.

26. Install the crossmember and the transmission retaining bolts. Remove the safety strap and the universal high lift transmission jack.

27. Rotate the crankshaft to gain access to converter studs. Install new stud nuts and torque to 20–30 ft. lbs.

28. Install the starter motor, rear engine plate cover and lower dust cover.

29. Install the speedometer cable.

30. Completely seat the solenoid body connector into solenoid valve

Installing converter-E4OD automatic transmission

Shift linkage adjustment-C5 and C6 transmission F series and Bronco

body receptacle. An audible click sound indicates proper installation.

31. Install the solenoid body connector heat shield with offset bending inward.

32. On 4WD models, install wire harness locators into crossmember.

33. Install the wire harness locator into extension housing wire bracket.

34. On 4WD models, install the 4WD drive switch connector and connect the transfer case shift linkage.

35. Install the manual lever position sensor connector. An audible click sound indicates proper installation.

36. Install the shift linkage. On 4WD models, install the shift rod to transfer case shift lever.

37. Install the rear driveshaft and install the front driveshaft on 4WD models.

38. Lower the vehicle, connect the negative battery cable and refill the transmission. Start the engine and check the fluid level.

39. Road test vehicle for proper operation and correct shift patterns.

SHIFT LINKAGE ADJUSTMENT

Bronco, E and F Series

1. Position the selector lever in the Drive (D) position for C5 and C6 transmissions and in the Overdrive (OD) position for AOD and E40D transmis-

sions. Hold it against the stop by applying an 8 pound weight to the selector lever knob.

2. Loosen the shift rod adjusting nut.

3. Shift the manual lever at the transmission into the Drive (D) or Overdrive (OD) position, by moving the lever all the way rearward, then forward 2 detents.

4. With the selector lever and the manual lever in position, tighten the nut at the bell housing to 12-18 ft. lbs.

5. Remove the 8 pound weight from the steering column selector lever knob.

6. Check the selector lever in all detent positions with engine running to ensure correct adjustment.

THROTTLE VALVE CONTROL CABLE ADJUSTMENT

Automatic Overdrive Transmission

4.9L AND 5.0L ENGINES

1. Set the parking brake and put selector in the N range. Remove the protective cover over the cable linkage if so equipped. (Do not put selector in P).

2. Verify that the throttle lever is at the idle stop. Do not attempt to adjust the idle stop.

3. Verify that the cable routing is

free of sharp bends or pressure points and that the cable operates freely. Lubricate the TV lever ball stud. Check for damage to cable or rubber boot.

4. Unlock the locking tab at the carburetor/upper intake manifold assembly end by pushing up from below and prying up the rest of the way to free the cable.

5. A retention spring must be installed on the TV control lever, to hold it in the idle position (as far to rear as the lever will travel) with about 10 pounds of force. If a suitable single spring is not available, two 8 cylinder TV return springs may be used. Attach retention spring(s) to the transmission TV lever hook rear end of spring to the transmission case.

6. De-cam the carburetor if so equipped. The carburetor throttle lever must be in the anti-diesel idle position. Verify that the take-up spring (carburetor end of the cable properly tensions the cable. If the spring is loose or bottomed out, check for bent brackets.

7. Push down the locking tab until flush.

8. Remove the detent springs from the transmission lever.

NEUTRAL SAFETY SWITCH ADJUSTMENT

1. Apply the parking brake. With

TV control cable locking tabs

the automatic transmission linkage properly adjusted, loosen the 2 switch retaining bolts.

2. Place the transmission lever in **N** position. Rotate the switch and insert the gauge pin (drill No.43 shank end) into the gauge pin holes of the switch. The gauge pin has to be inserted about 1/2 in. into the 3 holes of the switch.

3. Tighten the switch retaining bolts to 55-75 in. lbs. remove the gauge pin from the switch.

4. Check the operation of the switch. The engine should only start in **N** and **P**. The reverse lights should work when the transmission is in the **R** position.

Installing retention springs

TRANSFER CASE

Transfer Case Assembly

REMOVAL & INSTALLATION

New Process Model 208

1. Raise the vehicle and support it safely. Drain the fluid from the transfer case.

2. Disconnect the 4WD drive indicator switch wire connector at the transfer case.

3. Disconnect the speedometer driven gear from the transfer case rear bearing retainer.

4. Remove the nut retaining the transmission shift lever assembly to the transfer case.

Neutral safety switch adjustment

5. Remove the skid plate from the frame, if so equipped.

6. Remove the heat shield from the frame.

7. Support the transfer case with a transmission jack or equivalent.

8. Mark and disconnect the front driveshaft from the front output shaft yoke.

9. Mark and disconnect the rear driveshaft from the rear output shaft yoke.

10. Remove the bolts retaining the transfer case to the transmission adapter.

11. Lower the transfer case from the vehicle.

12. When installing place a new gasket between the transfer case and the adapter.

13. Raise the transfer case with a transmission jack so the transmission output shaft aligns with the splined transfer case input shaft.

14. Install the bolts retaining the case to the adapter and tighten to (crisscross pattern) 20–25 ft. lbs.

15. Connect the rear driveshaft to the rear output shaft yoke.

16. Connect the front driveshaft to the front output yoke.

17. Remove the transmission jack from the transfer case.

18. Position the heat shield to the frame crossmember and mounting lug to the transfer case and install and tighten the bolts and screw.

19. Install the skid plate to the frame.

20. Install the shift lever to the transfer case and tighten the retaining nut.

21. Install the speedometer driven gear to the transfer case.

22. Connect the 4WD indicator switch wire to the transfer case.

23. Install the drain plug. Remove the filler plug and install 9 pints of Dexron®II or equivalent type transmission fluid.

24. Lower the vehicle.

Borg Warner Model 1345

1. Raise the vehicle and support it safely.

2. Drain the fluid from the transfer case.

3. Disconnect the 4WD indicator switch wire connector at the transfer case.

4. Remove the skid plate from the frame, if so equipped.

5. Mark and disconnect the front driveshaft from the front output yoke.

6. Mark and disconnect the rear driveshaft from the rear output shaft yoke.

7. Disconnect the speedometer driven gear from the transfer case rear bearing retainer.

8. Remove the retaining rings and shift rod from the transfer case shift lever.

9. Disconnect the vent hose from the transfer case.

10. Remove the heat shield from the frame.

11. Support the transfer case with a transmission jack.

12. Remove the bolts retaining the transfer case to the transmission adapter.

13. Lower the transfer case from the vehicle.

14. When installing place a new gasket between the transfer case and the adapter.

15. Raise the transfer case with the transmission jack so that the transmission output shaft aligns with the splined transfer case input shaft. In-

TRANSFER CASE IDENTIFICATION

Year	Vehicle	Type
1986-87	F-150, F-250 and Bronco	New Process 208
1986-89	F-150, F-250 and F-350	Borg Warner 1345
1987-89	F-150, F, 250, F-350 and Bronco	Borg Warner 1356

stall the bolts retaining the transfer case to the adapter and tighten the bolts (crisscross pattern) to 25–43 lbs.

16. Remove the transmission jack from the transfer case.

17. Connect the rear driveshaft to the rear output shaft yoke.

18. Install the shift lever to the transfer case and install the retaining nut.

19. Connect the speedometer driven gear to the transfer case.

20. Connect the 4WD indicator switch wire connector at the transfer case.

21. Connect the front driveshaft to the front output yoke.

22. Position the heat shield to the frame crossmember and the mounting lug on the transfer case. Install and tighten the retaining bolts.

23. Install the skid plate to the frame.

24. Install the drain plug. Remove the filler plug and install 6.5 pints of Dexron®II type transmission fluid or equivalent.

25. Lower the vehicle.

Typical transfer case installation

Borg Warner model 1356 electronic shift

Borg Warner Model 1356 Electronic and Manual Shift

1. Raise the vehicle and support it safely.
2. Remove the nuts, bolts and skid plate from the frame, if so equipped.
3. Remove the plug and drain the fluid from the transfer case.
4. Remove the wire connector from the feed wire harness at the rear of the transfer case on electronic shift type. On manual shift type remove the 4WD indicator light.
5. Mark and disconnect the front driveshaft from the front output shaft yoke.
6. Mark and disconnect the rear driveshaft from the transfer case rear output shaft yoke.
7. Disconnect the speedometer drive gear from the transfer case rear cover.
8. Disconnect the vent hose from the mounting bracket. On manual shift type remove the shift rod assembly.
9. Support the transfer case with a jack. Remove the bolts retaining the transfer case to the transmission and the extension housing.
10. Slide the transfer case rearward

off the transmission output shaft and lower the transfer case from the vehicle.

11. Install in the reverse order of removal. Tighten the transfer case retaining bolts (crisscross pattern) to 25-43 ft. lbs. Remove the filler plug and install 4.0 pints of Mercon® type transmission fluid or equivalent.

LINKAGE ADJUSTMENT

No adjustment is possible or necessary on these transfer case units.

DRIVE AXLE

Driveshaft and U-Joints

REMOVAL & INSTALLATION

Driveshaft

1. Raise and safely support the vehicle. If the alignment marks are not visible, mark the relationship of the

rear driveshaft yoke and the drive pinion flange of the axle in line with the driveshaft so that they may be re-installed in the same position.

2. Disconnect the rear U-joint from the companion flange. Wrap tape or equivalent around the loose bearing caps to prevent them from falling off the spider. Pull the driveshaft toward the rear of the vehicle until the slip yoke clears the transmission extension housing and the seal. Install the appropriate tool in the housing to prevent the lubricant or fluid from leaking.

3. To install, reverse the removal procedure, taking note that if either the rubber seal on the output shaft or the seal in the end of the transmission extension housing is damaged it must be replaced. Also if the lugs on the axle pinion flange are shaved or distorted so that the bearings slide, replace the flange.

4. Install the U-bolts and torque the nuts to 8-15 ft. lbs. Mark the relationship of the rear driveshaft yoke and axle pinion flange before disassembly, to maintain driveline balance. If a vibration should exist, the driveshaft should be disconnected from the axle, rotated 180 degrees and re-installed.

Center Bearing

1. Remove the driveshafts.
2. Remove the center support bearing attaching bolts and remove the assembly from the vehicle.
3. Do not immerse the sealed bearing in any type of cleaning fluid. Wipe the bearing and cushion clean with a cloth dampened with cleaning fluid.
4. Check the bearing for wear or rough action by rotating the inner race while holding the outer race. If wear or roughness is evident, replace the bearing. Examine the rubber cushion for evidence of hardening, cracking, or deterioration. Replace it if it is damaged in any way.
5. Place the bearing in the rubber

Single type U-joint assembly

support and the rubber support in the U-shaped support and install the bearing in the reverse order of removal.

Single Type U-Joint

1. Disconnect the driveshaft from the rear axle flange.
2. If vehicle has a coupling shaft, slide the driveshaft off the coupling splines.
3. Working from the center support nearest to the rear of the vehicle, remove the attaching bolts and support the bearing.
4. On a vehicle with more than one coupling shaft, disconnect the rear shaft from the front one.
5. Remove the remaining center support attaching bolts and support the bearing.
6. Remove the transmission coupling shaft flange attaching nuts and remove the shaft and center bearing(s) as an assembly.
7. Thoroughly clean all driveshaft components before installing.

To install:

8. Connect the front flange or joint to the transmission flange.
9. Secure the center bearing to the frame bracket, tightening the bracket attaching bolts securely.
10. If vehicle has more than one coupling shaft, connect the rear shaft to the forward one, then install the remaining center support.
11. Connect the rear universal to the rear axle flange, tightening (evenly) nuts or bolts securely.

Double Cardan Type U-Joint

1. To remove the front or rear driveshaft, disconnect the double cardan joint from the flange at the transfer case.
2. Disconnect the single U-joint from the flange at the axle. Remove the driveshaft.
3. To install, position the single U-joint end of the driveshaft to the axle, before the cardan end. Install and

DOUBLE CARDAN ASSEMBLY

Double Cardan type U-joint assembly

tighten (evenly) all U-bolts, nuts, bolts and lockwashers.

Front Axle Shaft, Bearing and Seal

REMOVAL & INSTALLATION

Dana Model 60 Monobeam

1. Raise the vehicle and support it safely. Remove the front wheel.
2. Remove the disc brake caliper and wire it to the frame.
3. Remove the cap (Allen head screws) from the hub body. Remove the snapping that retains the axle shaft in the hub body.
4. Remove the lock ring seated in the groove of the hub body. Remove the body from the hub.
5. Remove the outer locknut, lockwasher and the inner locknut from the spindle. Remove the hub and rotor.
6. Remove the nuts retaining the spindle to the knuckle. Remove the splash shield and the caliper support

from the knuckle.

7. Pull the axle shaft out of the steering knuckle. If required remove the caged needle bearing from the spindle and remove the seal.

8. Install in the reverse order of removal. Pack the wheel bearing with suitable grease. Also pack the thrust face of the seal in the spindle bore and the V-seal on the axle shaft with grease.

Dana Models 44 and 50

1. Raise the vehicle and support it safely. Remove the front wheel.
2. Remove the disc brake caliper and wire it to the frame.
3. Remove the hub locks, wheel bearings and locknuts.
4. Remove the rotor and the outer wheel bearing.
5. Remove the grease seal and the inner wheel bearing from the rotor. Remove the inner and the outer races from the rotor.
6. Remove the spindle from the

Dana model 60 Monobeam front drive axle assembly

Exploded view Dana model 50—front drive axle assembly

Exploded view removable carrier-rear axle assembly

steering knuckle. Remove the splash shield.

7. On the right side of the vehicle, remove the shaft and joint by pulling the assembly out of the carrier. On the right side of the carrier, remove the clamp from the shaft and joint.

8. Slide the rubber boot onto the stub shaft and pull the shaft and joint from the splines of the stub shaft.

9. If required remove the needle bearing from the spindle and remove the seal from the shaft.

10. Install in the reverse order of removal. Pack the bearing with (wheel bearing) multi-purpose grease. Also pack the thrust face of the seal in the spindle bore and the V-seal on the axle shaft with grease.

Rear Axle Shaft, Bearing and Seal

REMOVAL & INSTALLATION

Removable Carrier

1. Raise and support the vehicle and remove the wheel/tire assembly from the brake drum.

2. Remove the nuts which secure the brake drum to the axle flange, then remove the drum from the flange.

3. Working through the hole provided in each axle shaft flange, remove the nuts which secure the wheel bearing retainer plate.

4. Using an axle puller, pull the axle shaft assembly out of the axle housing.

NOTE: The brake backing plate must not be dislodged. Install a nut to hold the plate in place after the axle shaft is removed.

5. If the axle has ball bearings: Loosen the bearing retainer ring by nicking it in several places with a cold chisel, then slide it off the axle shaft. On vehicles equipped with a thick retaining ring, drill a $\frac{1}{4}$ – $\frac{1}{2}$ inch hole part way through the ring, then break it with a cold chisel. A hydraulic press is needed to press the bearing off and to press the new one on. Press the new bearing and the new retainer ring on separately. Use a slide hammer to pull the old seal out of the axle housing. Carefully drive the new seal evenly into the axle housing, preferably with a seal driver tool.

6. If the axle has tapered roller bearings, use a slide hammer to remove the bearing cup from the axle housing. Drill a $\frac{1}{4}$ – $\frac{1}{2}$ inch hole part way through the bearing retainer ring, then break it with a cold chisel. A hydraulic press is needed to press the bearing off and remove the seal. Press on the new seal and bearing, then the new retainer ring. Do not press the bearing and ring on together. Put the cup on the bearing, not in the housing and lubricate the outer diameter of the cup and seal.

7. With ball bearings: Place a new gasket between the housing flange and backing plate. Carefully slide the axle shaft into place. Turn the shaft to start the splines into the side gear and push it in.

8. With tapered roller bearing: Move the seal out toward the axle shaft flange so there is at least $\frac{3}{32}$ in. between the edge of the outer seal and the bearing cup, to prevent snagging on installation. Carefully slide the axle shaft into place. Turn the shaft to start the splines into the side gear and push it in.

9. Install the bearing retainer plate.

10. Install the brake drum and the wheel/tire assembly.

Integral Carrier Type

1. Raise the vehicle and support it safely.

2. Remove the wheel/tire assembly and the brake drums.

3. Place a drain pan under the housing and drain the lubricant. Remove the housing cover and gasket, if used.

4. Remove the differential pinion mate shaft lock screw. Discard lock screw and replace with a new screw upon installation.

5. Lift out the differential pinion mate shaft. Shaft is a slip fit design and may be removed by hand.

6. Push the axle shafts inward and remove the C-locks from the inner end of the axle shafts. Temporarily replace

the shaft and lockbolt to retain the differential gears in position.

7. Remove the axle shafts. Be sure the seal is not damaged by the splines on the axle shaft.

8. Remove the bearing and oil seal from the housing. Inspect the axle shaft housing and axle shafts for burrs or damage.

9. Lightly coat the bearing assembly rollers with axle lubricant. Install the bearings in the axle housing until the bearing seats firmly against the shoulder.

10. Wipe all lubricant from the oil seal bore, before installing the seal. Install the oil seal.

11. Remove the lock screw and pinion shaft. Carefully slide the axle shafts into place. Be careful that you do not damage the seal with the splined end of the axle shaft. Engage the splined end of the shaft with the differential side gears.

12. Install the axle shaft C-locks on the inner end of the axle shafts and seat the C-locks in the counterbore of the differential side gears.

13. Rotate the differential pinion

DIFFERENTIAL PINION
LOCKSCREW SHAFT

Removing lock screw

gears until the differential pinion shaft can be installed. Install the differential pinion shaft lock screw. Tighten to 20-25 ft. lbs.

14. Install the brake drum and wheel/tire assemblies.

15. Install housing cover with new gasket and fill with the correct amount of the specified lubricant.

Manual Locking Hubs REMOVAL & INSTALLATION

1. Raise and support the vehicle safely.

2. Separate the cap assembly from the body assembly by removing the

Exploded view intergal carrier-rear axle assembly

Manual locking hubs

Allen head capscrews and remove the cap from the body.

3. Remove the snapping that retains the axle shaft in the hub body assembly.

4. Remove the lock ring seated in the groove of the wheel hub. Remove the body assembly from the hub.

5. Installation is the reverse of the removal procedure. Tighten the Allen head retaining screws to 40-60 inch lbs.

Automatic Locking Hubs

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely.

2. Remove capscrews from body assembly. Remove the cover. Do not drop spring, ball bearing, bearing race or retainer.

3. Remove rubber seal.

4. Remove the seal bridge retainer from the retainer ring spacer.

5. Remove the retaining ring by closing the ends with a tool and pull the hub lock assembly from the hub.

6. Installation is the reverse of the removal procedure. Tighten the retaining screws to 40-50 inch lbs.

Pinion Seal

REMOVAL & INSTALLATION

Dana Integral Carrier

1. Raise the vehicle and support it safely.

2. Mark the driveshaft axle end flange and the axle companion flange for correct installation. Remove the driveshaft.

3. Using a suitable tool, hold the pinion flange. Remove the pinion shaft nut.

4. Remove the pinion flange. To re-

move the seal, pry it out of the carrier.

5. Installation is the reverse of the removal procedure. The pinion flange must never be hammered on or installed with power tools. Tighten the pinion nut 250-270 ft. lbs. on the Dana models 60, 61 and 70. Tighten the pinion nut 440-500 ft. lbs. on the Dana model 80.

Ford Integral Carrier and Ford Removable Carrier

NOTE: This service procedure disturbs the pinion bearing preload and this preload must be carefully reset when assembling.

1. Raise the vehicle and support it safely.

2. Remove the wheels and the brake drums.

3. Mark the driveshaft axle end flange and the axle companion flange for correct installation. Remove the driveshaft.

4. Using an inch pound torque wrench on the pinion nut, record the torque required for rotation of the pinion through several revolutions.

5. Remove the pinion nut. Mark the companion flange in relation to the pinion for reinstallation.

6. Remove the rear axle companion flange. To remove the seal, pry it out of the carrier.

7. Installation is the reverse of the removal procedure. Tighten the pinion nut to a minimum torque of 160 ft. lbs., rotating the pinion to insure proper bearing seating. Take frequent drive pinion bearing torque preload readings until the original recorded

Automatic locking hubs

preload reading is obtained.

Differential Carrier

REMOVAL & INSTALLATION

Ford Removable Carrier

1. Raise the vehicle and support it safely. Remove the rear wheel/tire assemblies.

2. Remove the brake drums from the axle shaft flange studs.

3. Working through the hole provided in each axle shaft flange, remove the nuts that secure the rear wheel bearing retainer plate. Pull each axle shaft assembly out of the axle housing. Care must be exercised to prevent damage to oil seal. Install a nut on one of the brake carrier plate attaching bolts to hold the plate to the axle housing after the shaft has been removed. Whenever a rear axle shaft is replaced, the wheel bearing oil seals must be replaced. Remove the seals.

4. Scribe marks on the driveshaft end yoke and the axle U-joint flange to insure proper position at assembly. Disconnect the driveshaft at the rear axle U-joint, remove the driveshaft from the transmission extension housing. Install a suitable tool in the housing to prevent transmission leakage.

5. Place a drain pan under the carrier and housing, remove the carrier attaching nut and drain the axle. Remove the carrier assembly from the axle housing.

6. Synthetic wheel bearing seals must not be cleaned, soaked or washed in cleaning solvent. Clean the axle housing and shafts using kerosene and swabs. To avoid contamination of the grease in the sealed ball bearings, do not allow any quantity of solvent directly on the wheel bearings. Clean the matting surfaces of the axle housing and carrier.

7. Position the differential carrier on the studs in the axle housing using a new gasket between carrier and housing. Install the carrier-to-housing attaching nuts and tighten to 25–40 ft. lbs.

8. Remove the tool from extension housing. Position the driveshaft so that the front U-joint slip yoke splines to the transmission output shaft.

9. Connect the driveshaft to the axle U-joint flange, aligning the scribe marks made on the driveshaft end yoke and the axle U-joint flange during the removal procedure. Install the U-bolts and nuts.

10. Wipe a small amount of an oil-resistant sealer on the outer edge of each seal before it is installed. Do not put any of the sealer on the sealing lip. Install the oil seals in the ends of the rear axle housing with a suitable tool.

11. Install the axle shaft assemblies in the axle housing. Care must be exercised to prevent damage to the oil seals. When installing an axle shaft, place a new gasket between the housing flange and the brake backing plate and carefully slide the axle shaft into the housing so that the rough forging of the shaft will not damage the oil seal. Start the axle splines into the differential side gear and push the shaft in until the bearing bottoms in the housing.

12. Install the bearing retainer plates on the attaching bolts on the axle housing flanges. Install and tighten (alternately) nuts to 20–40 ft. lbs.

13. Install the rear brake drums and wheel/tire assemblies. Fill the rear axle with lubricant.

Axle Housing

REMOVAL & INSTALLATION

Dana Integral Carrier

1. Loosen the wheel stud nuts and the axle shaft retaining bolts.

2. Disconnect the rear shock absorbers from the spring seat caps. Then raise the rear end of the vehicle frame until the weight is off the rear springs. Place safety stands under the frame in this position.

3. Disconnect the flexible hydraulic line at the frame and disconnect the axle vent hose at the axle connection.

4. Disconnect the parking brake cable if so equipped at the equalizer and remove the cables from the cable support brackets.

5. Mark and disconnect the driveshaft from the rear U-joint flange.

6. Remove the nuts from the spring clips (U-bolts) and remove the spring seat caps.

7. Roll the axle from under the vehicle and drain the lubricant. Remove the wheels. Installation is the reverse of the removal procedure.

Ford Integral Carrier

1. Raise the vehicle and support it safely.

2. Remove the cover and drain the lubricant.

3. Remove both rear wheels and remove the drums.

4. Remove the axle shafts.

5. Remove the retaining nuts from each backing plate.

6. Remove the vent hose from the vent tube then remove the vent from the axle housing.

7. Disengage the brake line from the clips that retain the line to the axle housing.

8. Remove the hydraulic brake T-fitting from the axle housing.

9. Mark the driveshaft end yoke and the axle U-joint flange for proper reassembly. Remove the driveshaft.

10. Support the rear axle housing on a jack, then remove the spring clip U-bolt nuts. Remove the U-bolts and plates.

11. Disconnect the lower shock absorber studs from the mounting brackets on the axle housing.

12. Lower the axle housing and remove it from under the vehicle.

13. Installation is the reverse of the removal procedure.

Ford Removable Carrier

1. Raise the vehicle and support it safely.

2. Remove the carrier from the axle housing.

3. Remove the vent hose from the vent tube then remove the vent from the axle housing.

4. Remove the brake backing plate and wire it to the frame rail.

5. Disengage the brake line from the clips that retain the line to the axle housing.

6. Remove the hydraulic brake T-fitting from the axle housing.

7. Mark the driveshaft end yoke and the axle U-joint flange for proper reassembly. Remove the driveshaft.

8. Support the rear axle housing on a jack, then remove the spring clip U-bolt nuts. Remove the U-bolts and plates.

9. Disconnect the lower shock absorber studs from the mounting brackets on the axle housing.

10. Lower the axle housing and remove it from under the vehicle.

11. Installation is the reverse of the removal procedure.

STEERING

Steering Wheel

REMOVAL & INSTALLATION

1. Park the vehicle in a straight head position. Note position of the steering wheel. Disconnect the negative battery cable.

2. Remove the screw underside each steering wheel spoke and lift the horn switch assembly from the steering wheel.

3. Remove all electrical connections and remove horn switch assembly.

4. Remove steering wheel retaining nut. Using a suitable puller remove the steering wheel from the steering shaft. Do not hammer or use knock off type puller on steering wheel.

6. While supporting the steering gear, disconnect it from the frame side rail. Lower the gear assembly from the vehicle.

7. Install in the reverse order of removal. Before installing the gear, rotate the input shaft from stop to stop counting the total number of turns. Then turn back exactly half way, placing the gear on center. Make sure that the flat on the gear input shaft is facing straight up and aligns with the flat on the flex coupling. Tighten steering gear mounting bolts to 70 ft. lbs. and pitman arm retaining nut to 230 ft. lbs.

4. Remove the horn pad assembly from the steering wheel and turn the wheel to one stop.

5. Using a torque wrench on the steering wheel nut, measure the torque (preload) required to rotate the steering wheel at a constant speed for approximately 1½ turns.

6. If the gear preload is not within 5-9 inch lbs. the preload must be readjusted. Gear must be removed to adjust worm preload.

7. With the torque wrench still on the steering wheel nut, observe the highest reading (meshload) by rotating the steering shaft 90 degrees either way across center. The meshload must be within 9-14 inch lbs. and at least 2 inch lbs. over the preload. Meshload can be adjusted in the vehicle.

Preload and Meshload Check— In Vehicle

1. Make sure that the steering column is properly aligned and that the intermediate shaft flex coupling is not distorted.

2. Disconnect the pitman arm at the ball stud.

3. Lubricate the wormshaft seal with a drop of automatic transmission fluid.

Preload and Meshload Adjustment—Gear Removed

1. Tighten the selector cover bolts to 40 ft. lbs. Loosen preload adjuster locknut and tighten the worm bearing adjuster nut until all endplay has been removed.

2. Using a torque wrench and socket on wormshaft turn the wormshaft

1. Raise the vehicle and support it safely with the front wheels in the straight ahead position.

2. On F series, disengage the flex coupling shield from the steering gear input shaft shield and slide it up the intermediate shaft.

3. Disconnect the flex (rag joint) coupling from the steering shaft flange by removing the attaching nuts.

4. Disconnect the drag link from the sector shaft pitman arm.

5. Mark and remove the pitman arm from the gear sector shaft using proper pulling tools.

NOTE: Do not hammer on the end of the sector shaft or the tool, this will damage the steering gear.

Manual steering gear installation-F series

all the way to the right. Measure the left turn torque (preload) required to rotate the wormshaft at a constant speed for approximately $1\frac{1}{2}$ turns.

3. Tighten or loosen the adjuster locknut until the correct preload (7-9 inch lbs.) is obtained. Torque locknut to 187 ft. lbs.

4. Rotate the wormshaft from stop to stop, counting the total number of

turns, turn back halfway placing the gear on the center position.

5. With the torque wrench still on wormshaft, observe the highest reading (meshload) by rotating the wormshaft 90 degrees either way across center. The meshload must be within 12-14 inch lbs. and at least 4 inch lbs. over the preload.

6. Turn the selector shaft adjusting screw as required. hold the sector shaft adjusting screw and tighten locknut to 25 ft. lbs.

Power Steering Gear REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Disconnect the pressure and return lines from the gear. Plug the lines and the ports in the gear to prevent entry of dirt.

2. If equipped, remove the splash shield from the flex coupling. Disconnect the flex coupling at the steering gear.

3. Raise the vehicle and support it safely. Remove the pitman arm from the sector shaft.

4. Support the steering gear and remove the attaching bolts. Work the steering gear free from the flex coupling and remove the gear from the vehicle.

5. Install in the reverse order of removal procedure. Bleed power steering system if necessary.

ADJUSTMENT

Ford Intergal Gear Type

1. Make sure that the steering column is correctly aligned and remove the steering wheel cover. Disconnect the pitman arm from the sector shaft.

2. Disconnect the fluid reservoir return line and cap the reservoir return line tube. Place the end of the return line in a clean container and turn the steering wheel back and forth several times to empty the steering gear.

3. Turn the steering wheel to 45 degrees from the right stop.

4. Attach an inch pound torque wrench to steering wheel nut and record the torque to rotate the shaft $\frac{1}{8}$ turn toward center from the 45 degree position.

5. Turn the steering gear back to center and record the torque required to rotate the shaft back and forth across the center position. The set torque specification is measured rocking across center to a value of 10-14 in. lbs. greater than that measured 45 degrees from the right stop.

6. Loosen the locknut and tighten the sector shaft adjusting screw until the reading is the specified value greater than the torque at 45 degrees from the stop.

7. Tighten the adjusting screw locknut and recheck. Install pitman arm and steering wheel cover.

8. Refill the system with the fluid specified. Bleed the system.

Manual steering gear installation-E series

Power steering installation-Bronco and F series

Power Steering Pump

REMOVAL & INSTALLATION

Saginaw and ZF Type

1. Disconnect the pressure and return lines from the pump and plug them to prevent loss of fluid or entrance of dirt into the system.
2. Loosen the belt tension adjusting bolt all the way.
3. Remove the bolts attaching the pump mounting bracket to the air conditioning bracket if equipped.
4. Remove the pump, mounting bracket and pulley assembly.

5. Installation is the reverse of the removal procedure. Adjust belt tension. Refill and bleed system if necessary.

C-II Type

NOTE: The C-II pump is equipped with a fiberglass reservoir and can be identified by the reservoir. Never pry against the fiberglass, as damage will occur.

1. Disconnect the negative battery cable. Remove the power steering fluid from the pump reservoir, disconnect the fluid return hose at the reservoir and drain the fluid into a container.

Remove the pressure hose from the pump.

2. Remove the bolts from the pump adjustment bracket. Loosen the pump sufficiently to remove the belt off the pulley. Remove the pump (still attached to the adjustment bracket) from the support bracket.

3. Remove the pulley from the pump if required.

4. Remove the bolts attaching the adjustment bracket to the pump and remove the pump.

5. Place the adjustment bracket on the pump. Install the pulley on the pump if removed.

6. Place the pump with adjustment bracket and pulley on the support bracket. Install the bolts connecting the support bracket to the adjustment bracket.

7. Place the belt on the pulley and adjust belt tension. Tighten bolts on adjustment bracket.

8. Install the pressure hose to the pump fitting. Connect the return hose to the pump and tighten the clamp.

9. Fill the reservoir with power steering fluid, start the engine and turn the steering wheel from stop to stop to remove air from the system. Check for leaks and recheck the fluid level. Add fluid if necessary.

Power steering Installation-E series

Ford Intergal power steering gear

Power steering belt adjustment-conventional belt

BELT ADJUSTMENT

Conventional Belt

1. Check belt tension with a belt tension gauge. New belt tension is 120-150 lbs. and used belt tension is 90-120 lbs.

2. On vehicles equipped with pivot type adjustment brackets, loosen the pivot bolts. Insert a tool in adjustment slot, raise upward and tighten pivot bolts.

3. On vehicles equipped with slider type adjustment bracket, loosen the bolts in the slider slots. Insert a tool to pry against pump to obtain the correct belt tension. Tighten all bolts.

4. Recheck and adjust belt if necessary.

C-II power steering pump installation-typical

Power steering system purging tool C-II pump

Modified pump reservoir cap Saginaw pump

Automatically Tensioned Belt

The automatic belt tensioner will maintain correct belt tension if the correct length belt is used on the engine. To verify that the tensioner is working properly check to see that the belt length indicator mark on the tensioner is between the maximum and minimum marks. The belt tensioner has no provision for adjustment and will be damaged if forced to travel beyond the normal operating range.

SYSTEM BLEEDING

Conventional Method

1. Check and fill the power steering pump reservoir oil level to the correct level.
2. Run engine. Turn the steering wheel, approximately 5 times, one full cycle (without hitting the stops). This will help remove air trapped in the system.
3. Check fluid level add fluid as necessary.

Devac Method

NOTE: A fabricated Devac purging tool must be used for this service procedure.

1. Check the pump reservoir oil level (must be at correct level).
2. Insert the rubber stopper end of an air evacuator assembly into the filler tube tightly.
3. Connect a length of hose from the other end of the evacuator to a distributor machine or an air conditioner vacuum pump. Do not use engine vacuum.
4. Let the engine idle for 15 minutes. Turn the steering wheel one full cycle (without hitting the stops) every five minutes. This will help remove air trapped in the system.
5. Disconnect and remove the evacuator and reinstall the filler tube dipstick.

Tie Rod Ends

REMOVAL & INSTALLATION

NOTE: Replace the drag link or tie rod if a ball stud is excessively loose or if the drag link or tie rod is bent. Do not attempt to straighten a drag link or tie rod.

1. Disconnect the negative battery cable. Remove the cotter pin and nut from the tie rod ball studs.
2. Using suitable tools, remove tie rod ball studs from spindle and drag link.
3. If replacing just one tie rod end remove the end from the the adjusting sleeve. Always record the number of

Steering linkage- F-150 and Bronco

turns to remove the tie rod end from sleeve. When installing this will provide approximate toe in setting.

4. Installation is the reverse of the removal procedure. Always position adjusting sleeve clamp towards engine (nut faces front of engine). Tighten ball stud nut to 50-75 ft. lbs., use new cotter pins and check front end alignment.

4. Installation is the reverse of the removal procedure. Before installing the master cylinder, check the distance from the outer end of the booster assembly pushrod, to the front face of the brake assembly. The service specification (Bendix booster) is 0.995 in. Bleed brake system as required.

ter cylinder from booster.

2. Loosen hose clamp and remove manifold vacuum hose from booster.

3. From inside the cab, remove the attaching bolt, nut and plastic bushings and disconnect the booster pushrod from the brake pedal.

4. Remove nuts that retain the booster mounting bracket to the dash panel.

BRAKES

For all brake system repair and service procedure not detailed below, please refer to "Brakes" in the Unit repair section.

Master Cylinder

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Disconnect fluid level indicator switch connector from the master cylinder.

2. Disconnect the hydraulic lines from the master cylinder.

3. Remove the brake booster to master cylinder retaining nuts. Remove the master cylinder from the brake booster.

Height Sensing Brake Proportioning Valve

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle (rear suspension should hang at fully extended position).

2. Remove the linkage arm from the height sensing valve.

3. Remove the flow bolt holding the brake hose to valve.

4. Disconnect the brake line from the valve.

5. Remove bolts securing valve to mounting bracket. Remove valve.

6. Installation is the reverse of the removal procedure. Bleed brake system as required.

Power Brake Boosters

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Remove retaining nuts and mas-

Bendix booster pushrod gauge dimensions and adjustment

Height sensing brake proportioning valve installation-E series

5. Remove the booster assembly from engine compartment.

To install:

6. Mount the booster and bracket assembly to the engine side of the dash panel by sliding the bracket mounting bolts and valve operating rod in through the holes in the dash panel.

7. From inside the cab, install the booster mounting bracket to dash panel retaining nuts.

8. Position the master cylinder to the booster assembly and install the retaining-nuts.

9. Connect the manifold vacuum hose to the booster and secure with clamp.

10. From inside the cab connect the booster valve operating rod to the brake pedal with the attaching bolt, nut and plastic bushings.

11. Start engine and check operation of the brake system.

spring out with a brass rod and light hammer.

6. Disconnect the brake hose from the inlet port. Cap the hose and inlet port to prevent fluid leakage.

7. Remove the caliper from the spindle assembly by pushing it downward against the spindle and rotating the upper end upward out of the spindle assembly.

8. Installation is the reverse of the removal procedure. Bleed brake system.

Disc Brake Pads

REMOVAL & INSTALLATION

1. Remove the caliper assembly.
2. Remove the outer shoe and lining from the caliper. Remove the inner shoe and lining from the spindle assembly. Remove the shoe anti-rattle clip from the lower shoe abutment surface on the spindle assembly.
3. Thoroughly clean the areas of the caliper and spindle assembly that

come in contact during the sliding action of the caliper.

4. Installation is the reverse of the removal procedure. Use new components as required. Bleed the system as required.

Brake Rotor

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle. Remove the wheel.
2. Remove the caliper assembly from the rotor and support it out of the way with wire or equivalent.
3. Remove the dust cap, cotter pin, nut, washer and outer bearing and remove the rotor from the spindle.
4. On 4WD vehicles, the locking hub assembly must also be removed.
5. Install in the reverse order of removal procedure. Adjust wheel bearings. If replacing rotor assembly, always replace the grease seal for inner bearing.

Brake Caliper

REMOVAL & INSTALLATION

1. Siphon part of the brake fluid out of the master cylinder to avoid overflow when the caliper piston is pressed into the cylinder bore.
2. Raise the vehicle and support it safely. Remove the tire/wheel assembly.
3. Position a 8 in. C-clamp on the caliper and tighten the clamp to bottom the piston in the caliper cylinder bore.
4. Remove the key retaining screw.
5. Drive the caliper support key and

Installing anti-rattle clip on inner pad

Brake Drum

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle. Remove the wheel.
2. Remove the spring retaining nuts if equipped and remove the brake drum.
3. Install in the reverse order of removal procedure. If brake drum will not come off, insert a narrow tool through the brake adjusting hole in the backing plate and disengage the

adjusting lever while loosening the brake adjusting screw.

Brake Shoe

REMOVAL & INSTALLATION

NOTE: Before removing brake shoes record color and position of all brake springs they must be installed in their original position.

1. Raise and safely support the vehicle. Remove the brake drum.
2. Install a brake cylinder clamp around wheel cylinder to stop it from expanding.
3. Remove the bottom brake adjuster retaining spring. Remove the self-adjusting cable from the lever.
4. Remove the primary shoe to anchor spring.
5. Remove the secondary shoe to anchor spring. Remove the cable guide from the secondary shoe.
6. Remove the left and right shoe hold down spring.
7. Remove the brake adjuster assembly.
8. Remove the parking brake link and spring (note position for correct installation). Disconnect the parking brake cable from the brake lever.
9. Remove the brake shoes. Remove the parking brake lever from the secondary shoe by removing the retaining clip and spring washer.
10. Installation is the reverse of the removal procedure. The primary shoe (short shoe) always is installed toward the front of the vehicle. The secondary shoe (long shoe) is installed toward the

rear of the vehicle. Replace all brake springs as necessary. Lube with white brake grease where the brake shoes touch the backing plate. Check the brake fluid and adjust the brake system.

Wheel Cylinder

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle. Remove the wheel, drum and brake shoes.
2. Remove the cylinder to shoe connecting pins.
3. Disconnect the brake line from the wheel cylinder.
4. Remove the wheel cylinder retaining bolts and remove the cylinder from the brake backing plate.
5. Installation is the reverse of the removal procedure. Adjust the brakes and bleed the system as required.

Tension limiter assembly

Parking Brake Cable

REMOVAL & INSTALLATION

Equalizer-to-Control Assembly

1. Raise the vehicle and support it safely.
2. Back off the equalizer nut and remove slug of front cable from the tension limiter.
3. Remove the parking brake cable from the bracket or crossmember. Lower the vehicle.
4. Remove the forward ball end of the parking brake cable from the control clevis.
5. Remove the cable from the control by compressing the conduit end fitting prongs.
6. Using a cord attached to the control lever end of the cable, remove the cable from the vehicle.
7. Install in the reverse order of removal procedure.

Equalizer-to-Rear Wheel

1. Raise the vehicle and support it safely.
2. Remove the wheel, tension limiter and brake drum.
3. Remove the locknut on the threaded rod and disconnect the cable from the equalizer.
4. Working on the wheel side, compress the prongs on the cable retainer so they can pass through the hole in the brake backing plate.
5. With the spring tension off of the parking brake lever, lift the cable out of the slot in the lever and remove the cable through the brake backing plate hole.
6. Install in the reverse order of removal procedure.

ADJUSTMENT

Initial Adjustment Procedure

NOTE: Use this service adjustment procedure when a new tension limiter installed.

Typical rear brake shoe assembly

1. Depress the parking brake to last detent position.

2. Grip the tension limiter housing and tighten the equalizer nut 3 in. up the rod.

3. Check to make sure cinch strap has 1½ in. remaining.

Field Adjustment Procedure

NOTE: Use this service adjustment procedure to correct a slack system if a new tension limiter is not installed.

1. Vehicle drums must be cold for correct adjustment. Depress the parking brake to last possible detent position.

2. Grip the tension limiter housing and tighten the equalizer nut 6 full turns past the original position.

3. Using a cable tension guide or equivalent the tension should be 350 lbs. If tension is low repeat Step 2.

4. Release parking brake and check for rear wheel drag. There should be no brake drag.

FRONT SUSPENSION

Shock Absorbers

REMOVAL & INSTALLATION

2WD Vehicles

1. Raise and safely support the vehicle. Insert a tool from the rear side of the spring upper seat to hold the shock absorber upper retaining nut.

2. Loosen the stud by turning the hex provided on the exposed (lower) part of the stud and remove the nut.

3. Disconnect the lower end of the shock absorber from the lower bracket by removing the nut and bolt.

4. Compress the shock absorber and remove it from the vehicle.

5. Installation is the reverse of the removal procedure.

4WD Vehicles

1. Raise and safely support the vehicle. Remove the nut and bolt that retains the shock absorber to the upper shock bracket.

2. Disconnect the lower end of the shock absorber from the U-bolt plate.

3. Compress the shock absorber and remove it.

4. Reverse the removal procedure for installation.

Coil Springs

REMOVAL & INSTALLATION

1. Raise the front of the vehicle and support it safely. Also put a jack under the axle.

2. Disconnect the shock absorber from the lower bracket.

3. Remove the spring lower retainer attaching nuts from inside of the spring coil and remove the retainer.

4. Remove the spring upper retainer attaching screws and remove the retainer.

5. Slowly lower the axle and remove the spring.

6. Installation is the reverse of the removal procedure.

Leaf Springs

REMOVAL & INSTALLATION

1. Raise the vehicle frame until the weight is off the front spring and the wheels still touching the floor.

2. Disconnect the lower end of the shock absorber from the U-bolt spacer. Remove the U-bolts, cap and the spacer.

3. On vehicles equipped with a Dana Model 60 Monobeam axle, remove the 2 bolts that retain the tracking bar to the right spring cap and tracking bar mounting bracket.

4. Remove the nut from the hanger bolt retaining the spring at the rear. Drive out the hanger bolt.

5. Remove the nut connecting the front shackle and the spring eye. Drive out the shackle bolt and remove the spring.

6. Installation is the reverse of the removal procedure.

Upper Ball Joints

INSPECTION

NOTE: Always adjust the wheel bearings before ball joint inspection service procedure.

1. Raise the vehicle and place safety stands under the I-Beam axle beneath the spring.

2. Move the (upper part) wheel in and out. Observe the upper spindle arm and the upper part of the axle jaw.

3. A 1/32 in. or greater movement between the upper part of the axle jaw and the upper spindle arm indicates that the upper ball joint must be replaced.

REMOVAL & INSTALLATION

1. Raise and safely support the ve-

hicle. Remove the front wheel assembly. Remove the spindle. Remove the snapping from the upper ball joint if so equipped.

2. Assemble the C-frame tool T74P-4635-C and receiver cup tool D81T-3010-A or equivalent on the upper ball joint.

3. Turn the forcing screw clockwise until the ball joint is removed from the spindle.

4. Installation is the reverse of the removal procedure. Do not heat the ball joint or the spindle to aid in removal.

Lower Ball Joints

INSPECTION

NOTE: Always adjust the wheel bearings before ball joint inspection service procedure.

1. Raise the vehicle and place safety stands under the I-Beam axle beneath the spring.

2. Move the (lower part) wheel in and out. Observe the lower spindle arm and the lower part of the axle jaw.

3. A 1/32 in. or greater movement between the lower part of the axle jaw and the lower spindle arm indicates that the lower ball joint must be replaced.

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle. Remove the front wheel assembly. Remove the spindle. Remove the snapping from the lower ball joint.

2. Assemble the C-frame tool T74P-4635-C and receiver cup tool D81T-3010-A or equivalent on the lower ball joint.

3. Turn the forcing screw clockwise until the ball joint is removed from the spindle.

4. Installation is the reverse of the removal procedure. Do not heat the ball joint or the spindle to aid in removal.

Stabilizer Bar

REMOVAL & INSTALLATION

E and F Series

1. Disconnect the left and right ends of the bar from the link assembly attached to the I-Beam bracket.

2. Disconnect the retainer bolts and remove the stabilizer bar.

3. Disconnect the link assemblies by loosening the right and left locknuts from their I-Beam brackets.

4. Install in the reverse order of removal.

NOTE: The link must be installed with the bend facing forward on E series. On F series, right and left link assemblies are stamped with an "R" or an "L" to identify them.

Bronco and F150 4WD

1. Disconnect the stabilizer bar from the connecting links. Remove the nuts and bolts of the stabilizer bar retainer.

2. Remove stabilizer bar retainer.

3. Remove the stabilizer bar and insulator. The stud does not have to be removed.

4. Installation is the reverse of the removal procedure.

F250 4WD

1. Remove the bolts, washers and the nuts securing the links to the spring seat caps. If equipped with a Dana Model 60 Monobeam front axle, the links are secured to the mounting brackets.

2. Disconnect the links from the stabilizer bar and remove them.

3. Remove the retainers from the mounting bracket. Remove the stabilizer bar.

4. Installation is the reverse of the removal procedure.

King Pin and Bushings

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely.

2. Remove the wheel/tire assembly.

3. Remove the caliper assembly. It is not necessary to disconnect the

brake fluid hose. Wire the caliper to a suspension part to remove the weight of the caliper from the hose. Disconnect the steering linkage from the spindle arm.

4. Disconnect the steering linkage from the integral spindle and spindle arm.

5. Remove the nut and lockwasher from the locking pin and remove the locking pin.

6. Remove the upper and lower spindle bolt plugs and drive the spindle bolt out from the top of the axle. Remove the spindle and bearing. Knock out the seal.

7. Make sure that the spindle bolt hole in the axle is free of nicks, burrs and dirt. Install a new seal and coat the spindle bolt bushings and bolt hole with oil.

8. Place the spindle in position on the axle.

9. Pack the spindle thrust bearing with chassis lubricant and insert the bearing into the spindle with the open end of the bearing seal facing down into the spindle.

10. Install the spindle pin in (T stamped end faces up) the spindle with the locking pin notch in the spindle bolt aligned with the locking pin hole in the axle. Drive the spindle bolt through the axle from the top side until the spindle bolt locking pin notch is aligned with the locking pin hole.

11. Install a new locking pin. Install the locking pin lockwasher and nut. Tighten the nut to 40-55 ft. lbs. Install the spindle bolt plugs at the top and bottom of the spindle bolt.

12. Install the caliper assembly and connect the steering linkage to spindle. Install the wheel/tire assembly.

13. Grease the spindle assembly.

Check and adjust, if necessary, the toe-in adjustment.

Twin I-Beam Axle

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle as necessary. Remove the front wheel spindle, the front spring and the stabilizer bar if so equipped.

2. Remove the spring lower seat from the radius arm and then remove the bolt and nut that attaches the stabilizer bar bracket and radius arm to the front axle.

3. Remove the axle to frame pivot bracket bolt and nut. Remove the axle assembly.

To install:

4. Position the axle to the frame pivot bracket and install the bolt and nut finger tight.

5. Position the opposite end of the of the axle to the radius arm, install the attaching bolt from underneath through the bracket, the radius arm and the axle. Install the nut and tighten to 120-150 ft. lbs.

6. Install the spring lower seat on the radius arm so that the hole in the seat indexes over the arm to axle bolt. Install the front spring.

7. Install the front wheel spindle.

8. Lower the vehicle on its wheels or support the vehicle on the front springs. Tighten the axle to frame pivot bracket bolt.

Front Wheel Bearings

REMOVAL & INSTALLATION

1. Raise the vehicle. Support the ve-

Twin I-Beam axle with ball joints

hicle safely and remove the wheel.

2. Remove the brake caliper and wire it to the underbody to prevent damage to the brake hose.

3. Remove the grease cap, cotter pin, retainer adjusting nut and washer. Remove the outer bearing.

4. Pull the hub and rotor off the spindle. Remove and discard the grease seal.

5. Remove the inner bearing from the hub. Remove all traces of old lubricant from the bearings, hub and spindle with solvent and dry thoroughly.

6. Inspect the bearing races for scratches, pits or cracks. If the races are worn or damaged, remove them with a drift.

7. If the inner or outer bearing races were removed, replace them in the hub with the proper tool. The races will be properly seated when they are fully bottomed.

8. Replace the grease retainer. Pack the inside of the hub with lithium base grease, high temperature multi-purpose long life lubricant. Fill the hub until the grease is flush with the inside diameters of both bearing races.

9. Pack the bearings with wheel bearing grease, working as much lubricant as possible between the rollers and the cages.

10. For installation reverse the removal procedure. Adjust the wheel bearings.

ADJUSTMENT

2WD Vehicles

1. Raise the vehicle and support it safely.

2. Remove the wheel cover and the grease cap from the hub. Remove the cotter pin and the locknut. Loosen the adjusting nut 3 turns.

3. Remove the caliper. While rotating the wheel, tighten the adjusting nut to 22-25 ft. lbs. to seat the bearings.

4. Back off the adjusting nut 1/8 turn and install the retainer and new cotter pin without additional movement of the adjusting nut.

5. Check the wheel rotation. The bearing endplay is 0.001-0.010 in. Reinstall the grease cap and the wheel cover.

4WD Vehicles

1. Raise the vehicle and support it safely.

2. For Bronco and F series (manual locking hubs) with Dana 44IFS front axle, use the following:

a. Remove the hub lock assembly.

b. Using a torque wrench and a locknut wrench, apply inward pressure to unlock the adjusting nut

locking splines and turn the nut clockwise to tighten to 50-60 ft. lbs. while rotating the wheel back and forth.

c. Apply inward pressure to the locknut wrench to disengage the adjusting nut locking splines and back off the adjusting nut 180 degrees.

d. Retighten the adjusting nut to 15 ft. lbs. The final endplay on the wheel on the spindle is 0.00-0.006 in. Remove the tools and install the hub lock.

3. For F series (automatic hubs) with Dana 501IFS and Dana 60 Monobeam front axle, use the following:

a. Remove the hub lock assembly.

b. Remove the outer locknut and lockwasher.

c. Using a locknut wrench, tighten the inner locknut to 50 ft. lbs. to seat the bearing.

d. Back off the inner locknut and retighten to 31-39 ft. lbs.

e. While rotating the wheel, back off the locknut 135°-150°. Install the lockwasher. Install the outer locknut and tighten to 160-205 ft. lbs. Install the hub locks.

4. Lower the vehicle. The final endplay on the wheel on the spindle is 0.00-0.006 inch.

lower end free of the mounting bracket on the axle housing.

3. Remove the attaching nut from the upper mounting stud and remove the shock absorber.

To install:

4. Position the shock absorber with the rubber bushings and steel washers to the upper mounting bolt.

5. Swing the lower end of the shock absorber into the mounting bracket on the axle housing. Install the attaching washers, mounting bolt and self-locking nut.

6. Install the self-locking nut on the upper mounting bolt.

7. Lower the vehicle.

F Series

1. Raise and safely support as necessary. Remove the self-locking nut, steel washer and rubber bushings at the upper and lower ends of the shock absorber.

2. Remove the unit from the vehicle.

3. To install, position the shock absorber on the mounting brackets with the large diameter at the top.

4. Install the rubber bushing, steel washer and self-locking nut.

Leaf Spring

REMOVAL & INSTALLATION

E Series

1. Raise the rear end of the vehicle and support the chassis with safety stands. Support the rear axle with a floor jack or hoist.

2. Disconnect the lower end of the shock absorber from the bracket on the axle housing.

3. Remove the spring clips (U-bolts) and the spring clip cap.

4. Lower the axle and remove the spring front bolt from the hanger.

5. Remove the 2 attaching bolts from the rear of the spring. Remove the spring and the shackle.

REAR SUSPENSION

Shock Absorber

REMOVAL & INSTALLATION

Bronco and E Series

1. Raise the vehicle and support it safely.

2. Remove the shock absorber lower attaching nut and bolt and swing the

Typical rear suspension

6. Assemble the upper end of the shackle to the spring with the attaching bolt.

7. Connect the front of the spring to the front bracket with the attaching bolt.

8. Assemble the spring and shackle to the rear bracket with the attaching bolt.

9. Place the spring clip plate over the head of the center bolt.

10. Raise the axle with a jack and guiding it so that the center bolt enters the pilot hole in the pad on the axle housing.

11. Install the spring clips, cap and attaching nuts. Tighten the nuts snugly.

12. Connect the lower end of the shock absorber to the lower bracket.

13. Tighten the spring front mounting bolt and nut, the rear shackle nuts and spring clip nuts.

14. Remove the safety stands and lower the vehicle.

F Series 2WD

1. Raise the vehicle frame, until the weight is off the rear spring, with the tires still touching the floor.

2. Remove the nuts from the spring U-bolts and drive the U-bolts from the U-bolt plate. If so equipped, remove the auxiliary spring and the spacer.

3. Remove the spring-to-bracket nut and bolt at the front of the spring.

4. Remove the shackle upper and lower nuts and bolts at the rear of the spring. Remove the spring and shackle assembly from the rear shackle bracket.

5. If the bushings in the spring or shackle are worn or damaged, replace them.

To install:

6. Position the spring in the shackle and install the upper shackle-to-spring bolt and nut with the bolt head facing outboard.

7. Position the front end of the spring in the bracket and install. Position the shackle in the rear bracket and install.

8. Position the spring on top of the axle with the spring tie bolt centered in the hole provided in the seat. If equipped, install the auxiliary spring and spacer.

9. Install the spring U-bolt plate and nuts. Lower the vehicle. Tighten the spring U-bolt nuts. Tighten the front spring bolt and nut and the rear shackle bolts and nuts.

F Series 4WD

1. Raise the vehicle frame until the weight is off the rear springs with the wheels still touching the floor.

2. Remove the nuts from the spring U-bolts.

3. Drive the U-bolts out of the shock absorber lower bracket and the spring cap and remove the U-bolts.

4. Remove the spacer from the top of the spring.

5. If equipped with auxiliary springs, remove the auxiliary spring and spacer.

6. Remove the shackle to bracket bolt and nut from the rear of the spring.

7. Remove the spring-to-hanger bolt and nut from the front of the spring and remove the spring.

8. Remove the shackle-to-spring bolt and nut and remove the shackle from the spring.

9. Position the shackle to the spring and install the attaching bolt and nut. The bolt must be installed so the nut is away from the frame.

10. Position the spring to the spring front hanger and install the attaching bolt and nut.

11. Position the shackle to the bracket and install the attaching bolt and nut.

12. Align the spring toe bolt with the pilot hole in the axle spring seat and, if so equipped, install the auxiliary spring and spacer.

13. Position the spacer on top of the spring and install the U-bolts over the spacer, spring and axle.

14. Position the spring cap and shock lower bracket to the axle and U-bolts. Install the U-bolt attaching nuts.

15. Lower the vehicle and tighten the front spring bracket bolt and nut and the rear shackle bolts and nuts.

Bronco

1. Raise the vehicle by the axles and install safety stands under the frame.

2. Disconnect the shock absorber from the axle.

3. Remove the U-bolt attaching nuts and remove the U-bolts and the spring clip plate.

4. Lower the axle to relieve spring tension and remove the nut from the spring front attaching bolt.

5. Remove the spring front attaching bolt from the spring and hanger with a drift.

6. Remove the nut from the shackle to hanger attaching bolt and drive the bolt from the shackle and hanger with a drift and remove the spring from the vehicle.

7. Remove the nut from the spring rear attaching bolt. Drive the bolt out of the spring and shackle with a drift.

8. Position the shackle (closed section facing toward front of vehicle) to the spring rear eye and install the bolt and nut.

9. Position the spring front eye and bushing to the spring front hanger and install the attaching bolt and nut.

10. Position the spring rear eye and bushing to the shackle and install the attaching bolt and nut.

11. Raise the axle to the spring and install the U-bolts (when an axle cap is not used, the U-bolt shank should contact the leaf edges) and spring clip plate. Align the spring leaves.

12. Tighten the U-bolt nuts and the spring front and rear attaching bolt nuts. The U-bolts should contact the spring assembly edges or axle seat.

13. Connect the shock absorber to the axle and tighten the nut.

14. Remove the safety stands and lower the vehicle.

Rear Wheel Bearings

REMOVAL & INSTALLATION

Dana Full Floating Axle

1. Loosen the axle shaft attaching bolts.

2. Raise the rear wheels off the floor and place jackstands under the rear axle housing so that the axle is parallel with the floor.

3. Remove the axle shaft attaching bolts.

4. Remove brake drum, axle shaft and gaskets.

5. With the axle shaft removed, remove the gasket from the axle shaft flange studs.

6. Remove the wheel bearing hub adjusting nuts.

7. Remove the outer bearing cone and pull the wheel straight off the axle.

8. With a suitable tool that will clear the outer bearing cup, drive the inner bearing cone and inner seal out of the wheel hub.

9. Wash all the old grease or axle lubricant out of the wheel hub, using a suitable solvent.

10. Wash the bearing cups and rollers and inspect them for pitting, galling and uneven wear patterns. Inspect the roller for end wear.

11. If the bearing cups are to be replaced, drive them out with a drift. Install the new cups with a block of wood and hammer or press them in.

12. If the bearing cups are properly seated, a 0.0015 in. feeler gauge will not fit between the cup and the wheel hub.

13. Pack each bearing cone and roller with a bearing packer or equivalent.

14. Place the inner bearing cone and roller assembly in the wheel hub. Install a new inner seal in the hub.

15. Install the hub assembly (with hub tab and keyway aligned) and outer bearing.

16. Install and tighten the bearing adjusting nut to 65-75 ft. lbs. while rotating the wheel.

3 FORD FULL SIZE BRONCO • PICK-UP • VAN

17. Back off (loosen) the adjusting nut $\frac{1}{4}$ of a turn then tighten to 15–20 ft. lbs.

18. Install axle shafts with new axle flange gaskets.

19. Install drum and tire/wheel assembly. Tighten the axle shaft retaining bolts to 40–50 ft. lbs.

ADJUSTMENT

Dana Full Floating Axle

1. Tighten the bearing adjusting nut to 65–75 ft. lbs. while rotating the wheel.

2. Back off the adjusting nut $\frac{1}{4}$ of a turn then retorque to 15–20 ft. lbs.

VEHICLE IDENTIFICATION CHART

It is important for servicing and ordering parts to be certain of the vehicle and engine identification. The VIN (vehicle identification number) is a 17 digit number visible through the windshield on the driver's side of the dash and contains the vehicle and engine identification codes. The tenth digit indicates model year and the eighth digit indicates engine code. It can be interpreted as follows:

Engine Code					
Code	Cu. In.	Liters	Cyl.	Fuel Sys.	Eng. Mfg.
C	122	2.0	4	Carb.	Ford
A	140	2.3	4	EFI	Ford
E	140	2.3	4	(Turbo Diesel)	Mitsubishi
S	171	2.8	6	Carb.	Ford
T	177	2.9	6	EFI	Ford
U	183	3.0	6	EFI	Ford
X	244	4.0	6	EFI	Ford

Model Year	
Code	Year
G	1986
H	1987
J	1988
K	1989
L	1990

② At 250 rpm

③ 1707-1849 PSI

FIRING ORDERS

NOTE: To avoid confusion, always replace spark plug wires one at a time.

122 (2.0L) and 140 (2.3L) 4 cylinder
Engine firing order: 1-3-4-2
Distributor rotation: clockwise

171 (2.8L), 177 (2.9L) and 183 (3.0L) V6 engines
Firing order: 1-4-2-5-3-6
Distributor rotation: clockwise

N—Negative
P—Positive

ENGINE ELECTRICAL

NOTE: Disconnecting the negative battery cable on some vehicles may interfere with the functions of the on board computer systems and may require the computer to undergo a relearning process, once the negative battery cable is reconnected.

Distributor

REMOVAL & INSTALLATION

Duraspark II Ignition System

1. Disconnect the negative battery cable. Remove the distributor cap and position the cap and ignition wires to the side.
2. Disconnect and plug the vacuum hose(s) from the vacuum diaphragm assembly.
3. Disconnect the wire harness plug from the distributor connector.
4. Rotate the engine to align the stator pole and any armature pole.
5. Scribe a mark on the distributor body and engine block to indicate the

Dura Spark II Ignition system

position of the rotor tip and position of the distributor in the engine.

6. Remove the holddown bolt and clamp located at the base of the distributor.

7. Remove the distributor from the engine. Do not rotate the engine while the distributor is removed.

To install:

8. Position the distributor in the engine with the rotor aligned to the

marks made on the distributor, or to the place the rotor pointed when the distributor was removed.

9. Install the mounting bolt and clamp, but do not tighten so the distributor can be turned for ignition timing purposes.

10. If the engine was rotated while the distributor was removed, rotate the engine (in normal direction of rotation) until No. 1 piston is on TDC

Armature/stator assembly alignment

17. Tighten the distributor holddown bolt to 17-25 ft. lbs. Re-check the initial timing and readjust if necessary. Connect the diaphragm assembly hose(s).

TFI-IV System (Thick Film Integrated) Ignition System

1. Disconnect the negative battery cable. Disconnect the primary wiring connector from the distributor.

2. Remove the distributor cap and adapter and position it and the attached wires out of the way.

NOTE: Before removing the distributor cap, mark the position of the No. 1 wire tower on the distributor base for installation purposes.

3. Remove the rotor. Remove the TFI connector.

4. Remove the distributor holddown bolt (some engines may be equipped with security type holddown bolt) and clamp.

5. Avoid turning the engine, if possible, while the distributor is removed. If the engine is turned from TDC position, TDC timing marks will have to be reset before the distributor is installed.

6. Rotate the distributor in the engine block to align the leading edge of the vane and the vane switch (vane should be centered in the vane switch stator assembly).

7. Check that No. 1 piston is on compression stroke and timing marks and rotor (rotor tip pointing at No. 1 spark plug wire position on distributor cap) are aligned in the correct position.

8. After the distributor has been fully seated on the block, install the hold down bracket and bolt. Do not fully tighten at this time.

9. Connect the distributor TFI and primary wiring harnesses.

10. Install the distributor rotor and cap adapter. Tighten the attaching screws to 2.1-2.9 ft. lbs.

11. Install the distributor cap and wires in the correct position. Reconnect the negative battery cable.

12. Set the initial timing to specifications as shown on the Vehicle Emission Control Information Decal.

Thick Film Integrated (TFI) Ignition system with universal distributor

(Top Dead Center) of the compression stroke. The TDC mark on the crankshaft pulley and the pointer should align. Rotor tip pointing at No. 1 spark plug wire position on distributor cap upon installation.

11. Engage the oil pump intermediate shaft and insert the distributor until fully seated on the engine, if the distributor does not fully seat, turn the engine slightly to fully engage the intermediate shaft.

NOTE: The oil pump intermediate shaft may be turned with a tool to align the shaft with the distributor.

12. Rotate the distributor in block if necessary to align armature and stator assembly poles. Install the distributor holddown bolt but do not fully tighten.

13. Check that No. 1 piston is on compression stroke and timing marks and rotor are aligned in the correct position.

14. Connect distributor to wiring harness connection.

15. Install the distributor cap and wires in the correct position.

16. Reconnect the negative battery cable. Set the initial timing to specifications as shown on the Vehicle Emission Control Information Decal.

13. Tighten the distributor holddown bolt to 17–25 ft. lbs. Recheck the initial timing and readjust if necessary.

Distributorless Ignition System

All engine timing and spark distribution is handled electronically with no moving parts. During basic operation the EEC IV module determines the ignition timing required by the engine and DIS module determines which ignition coil to fire.

The distributorless ignition system for the 2.3L (twin spark plug) engine consists of a crankshaft timing sensor, DIS module, 2 ignition coil packs and a spark angle portion of the EEC IV module.

Crankshaft Timing Sensor

Assembly

1. Disconnect the negative battery cable.

2. Disconnect the sensor electrical connectors from the engine wiring harness.

3. Remove the large electrical connector from the crankshaft timing sensor assembly by prying out the red retaining clip and removing the 4 wires.

4. Remove the crankshaft pulley assembly by removing the accessory drive belts and then the 4 bolts that retain the crankshaft pulley hub assembly. Remove the timing belt outer cover.

5. Rotate the crankshaft so that the keyway is at the 10 o'clock position. This will place the vane window of both the inner and outer vane cups over the crankshaft sensor timing assembly.

NOTE: The vane cups are attached to the crankshaft pulley hub assembly.

6. Remove the 2 crankshaft timing sensor retaining bolts and the plastic wire harness retainer which secures the crankshaft sensor to its mounting bracket.

7. Remove the crankshaft timing sensor assembly, sliding the wires out from behind the inner timing belt cover.

To install:

8. Remove the large electrical connector from the new crankshaft timing sensor assembly.

9. Position the crankshaft timing sensor assembly. First slide the electrical wires behind the inner timing belt cover, now hold the sensor assembly loosely in place with the retaining bolts but do not tighten the bolts at this time.

10. Install the large electrical connector onto the crankshaft timing sensor assembly.

NOTE: Be sure that the 4 wires to the large electrical connector are installed in the proper locations. The sensor will not function properly if the wires are installed incorrectly.

11. Reconnect both of the crankshaft timing sensor electrical connectors to the engine harness.

12. Rotate the crankshaft so that the outer vane on the crankshaft pulley hub assembly engages both sides of the crankshaft Hall Effect sensor positioner tool T89P-6316-A or equivalent and tighten the sensor assembly retaining bolts to 22–31 inch lbs.

13. Rotate the crankshaft so that the vane on the crankshaft pulley hub is no longer engaged in the crankshaft sensor positioner tool and remove the tool.

14. Install a new plastic wire harness retainer to secure the crankshaft timing sensor harness to its mounting bracket and trim off the excess.

15. Install the timing belt outer cover.

16. Install the crankshaft pulley assembly and tighten the 4 attaching bolts to 12–18 ft. lbs.

17. Install the drive belts and adjust as necessary. Reconnect the negative battery cable and perform a vehicle road test.

Ignition Module Assembly

1. Disconnect the negative battery cable.

2. Disconnect each electrical connector of the DIS ignition module assembly by pushing down the connector locking tabs where it is stamped **PUSH** and then pull it away from the module.

3. Remove the 3 retaining screws, remove the ignition module assembly from the lower intake manifold.

To install:

4. Apply an even coat (approximately $\frac{1}{32}$ in.) of a suitable silicone dielectric compound to the mounting surface of the DIS module.

5. Mount the DIS module assembly onto the intake assembly and install the retaining screws. Torque the screws to 22–31 inch lbs.

6. Install the electrical connectors to the DIS ignition module assembly. Reconnect the negative battery cable.

Ignition Coil Assemblies

1. Disconnect the negative battery cable.

2. Disconnect the electrical harness connector from the ignition coil pack.

3. Remove the spark plug wires by squeezing the locking tabs to release the coil boot retainers.

4. Remove the coil pack mounting screws and remove the coil pack. On vehicle equipped with power steering it may be necessary to remove the intake (left side) coil and bracket as an assembly.

To install:

5. Install the coil pack and the retaining screws. Torque the retaining screws to 40–62 inch lbs.

6. Connect the spark plug wires and connect the electrical connector to the coil pack.

7. Reconnect the negative battery cable. Be sure to place some dielectric compound into each spark plug boot prior to installation of the spark plug wire.

Ignition Timing

ADJUSTMENT

The procedure below is for setting initial timing only. This procedure is to be used under normal circumstances. If problems are encountered setting initial timing using this procedure further diagnosis is necessary.

NOTE: On the distributorless ignition system timing is preset and is not adjustable.

1. Place the transmission in **P** or **N**. Turn the air conditioner and heater to the **Off** position.

2. Remove the vacuum hoses from the distributor vacuum advance connection at the distributor and plug the hoses on non EEC systems.

3. Connect inductive timing light and tachometer (non EEC systems).

4. Disconnect the single wire in line spout connector (near the distributor) or remove the shorting bar from the double spout connector on EEC-IV systems.

5. If the vehicle is equipped on non EEC systems with a barometric pressure switch disconnect it from the ignition module. Install a jumper wire across the pins at the ignition module connector (yellow and black wires).

Tachometer connection

6. Start the engine and allow it to reach normal operating temperature.
7. With the engine at the timing rpm if specified, check initial timing.

Alternator

BELT TENSION ADJUSTMENT

1. Disconnect the negative battery cable. Loosen alternator adjustment and pivot bolts.
2. Position alternator housing using a suitable tool to attain correct belt tension. Use caution not to damage alternator housing.
3. Tighten adjustment bolt and release pressure on tool.
4. Tighten pivot bolt and check belt tension using belt tension gauge T63L-8620A or equivalent. The gauge should be positioned at mid-point between 2 pulleys.
5. The belt tension measurement specification parameters are (new belt) 50-190 lbs. (used belt) 40-160 lbs. and the allowable minimum is 40-90 lbs. Use the parameters as a guideline, and the larger the engine displacement the more tension required for belt adjustment. The smaller the engine displacement the less belt tension required. Reconnect the negative battery cable.

REMOVAL & INSTALLATION

1. Disconnect battery ground cable(s).
2. Remove all electrical connectors from the alternator.
3. Loosen the alternator mounting bolts and remove the adjustment arm to alternator attaching bolt.
4. Disengage the alternator belt.
5. Remove the alternator mounting bolt and alternator. Remove the alternator fan shield if so equipped.
6. Installation is the reverse of the removal procedure.

Starter

For further information on the charging system, please refer to "Charging and Starting" in the Unit Repair section.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable(s).
2. Raise the vehicle and support it safely.
3. Disconnect starter cable at the starter terminal.
3. Remove the starter mounting bolts.

Alternator belt installation

Glow plug installation

4. Remove the starter assembly.

To install:

5. Position the starter assembly to the flywheel housing and start the mounting bolts.
6. Snug all the bolts while holding the starter squarely against its mounting surface and fully inserted into the pilot hole. Tighten the bolts to 15-20 ft. lbs.
7. Reconnect the starter cable at the starter terminal. Lower the vehicle. Connect the negative battery cable(s).

Diesel Glow Plugs

REMOVAL & INSTALLATION

1. Disconnect the negative battery cables.
2. Remove the nuts attaching bus bar to glow plugs. Remove glow plugs from the cylinder head.
3. Installation is the reverse of the removal procedure. Tighten the glow plugs to 11-14 ft. lbs. and bus bar attaching nuts to 9-12 inch lbs.

CHASSIS ELECTRICAL

Heater Blower Motor

REMOVAL & INSTALLATION

With Air Conditioning

1. Disconnect the negative battery cable(s).
2. In the engine compartment, disconnect the wire harness connection from the motor by pushing down on the tab while pulling the connector off at the motor.
3. Remove the solenoid box cover, if so equipped.
4. Remove the air cleaner or the air inlet duct as necessary.
5. Disconnect the cooling tube from the blower motor.
6. Remove the mounting plate screws and remove the motor and wheel assembly from the evaporator assembly housing.
7. Installation is the reverse of removal procedure.

Without Air Conditioning

1. Disconnect the negative battery cable(s). On California vehicles, remove the emission module forward of the blower motor.
2. On Aerostar, remove the air cleaner and duct as necessary. Remove the vacuum reservoir from the blower.
3. Disconnect the wire harness connection from the motor by pushing down on the tab while pulling the connector off at the motor.
4. Disconnect the cooling tube from the blower motor. Remove the mounting plate screws.
5. Holding the cooling tube aside, pull the motor and wheel assembly from heater blower housing.
6. Installation is the reverse of removal procedure.

Blower motor assembly components

Windshield Wiper Motor

REMOVAL & INSTALLATION

1. Turn the wiper switch on. Turn the ignition switch **ON** until the blades are straight up. Then turn the ignition switch **OFF** to keep them there.
2. Disconnect the negative battery cable(s). Disconnect the wiper motor wiring connector.
3. Remove the right hand wiper arm and blade. On the Aerostar, remove both wiper arms and the cowl grille.
4. Remove the right hand pivot nut and allow the linkage to drop into the cowl.
5. Remove the linkage access cover,

located on the right side of the dash panel near the wiper motor.

6. Reach through the access cover opening and unsnap the wiper motor clip.

7. Push the clip away from the linkage until it clears the crank pin, then push it off of the linkage.

8. Remove the wiper linkage from the motor crank pin. Remove the attaching screws and remove the motor.

9. Installation is the reverse of the removal procedure.

Windshield Wiper Switch

REMOVAL & Installation

Aerostar

NOTE: The switch handle is an integral part of the switch and cannot be removed separately.

1. Disconnect the negative battery cable.
2. Remove the cluster finish panel retaining screws.
3. Remove the 3 left control pod retaining screws.
4. Remove the wiring connector from the switch.
5. Remove the 2 lamp switch to control pod retaining screws and remove the switch.
6. Installation is the reverse of the removal procedure.

Bronco II and Ranger

NOTE: The switch handle is an integral part of the switch and cannot be removed separately.

1. Disconnect the negative battery cable(s).
2. Remove the trim shrouds.
3. Disconnect the electrical connector.
4. Peel back the foam sight shield.
5. Remove the screws holding the switch and remove the switch.
6. Installation is the reverse of the removal procedure.

Instrument Cluster

REMOVAL & INSTALLATION

Aerostar

1. Disconnect the negative battery cable.
2. Remove the cluster housing.
3. Remove the cluster mounting screws.
4. Disconnect the wiring harness connectors from the printed circuit.
5. Disconnect the speedometer cable and remove the cluster assembly.
6. If equipped with an electronic cluster, pull the top toward the steering wheel. Reach behind the cluster and unplug the connectors. Swing the bottom of the cluster out and remove it.

Instrument cluster-Bronco II/Ranger

7. Installation is the reverse of removal procedure.

Bronco II and Ranger

1. Disconnect the negative battery cable(s).

2. Remove the steering column shroud.

3. If equipped with a tilt steering column, loosen the bolts which attach the column to the band support to provide sufficient clearance for cluster removal.

4. Remove the cluster to panel retaining screws.

5. Position the cluster away from the panel to disconnect the speedometer cable.

6. Disconnect the harness connector plug from the printed circuit and remove the cluster assembly.

7. Installation is the reverse of removal procedure.

Speedometer

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable(s). Remove the instrument cluster.

2. Remove the lens and mask from the cluster.

3. Remove the 2 speedometer attaching screws and remove the speedometer head assembly.

4. Reverse the procedure for installation.

Radio

REMOVAL & INSTALLATION

1. Disconnect the battery ground cable(s).

2. Remove the finish panel assembly.

3. Remove the screws securing radio mounting bracket to instrument panel. Remove the radio.

4. Disconnect the antenna cable, speaker wires and power wire.

5. Remove the rear radio support bracket.

6. Installation is the reverse of the removal procedure.

Headlight Switch

REMOVAL & INSTALLATION

Aerostar

1. Disconnect the negative battery cable.

2. Remove the cluster finish panel assembly retaining screws.

3. Remove the left control pad retaining screws.

4. Remove the wiring connector from the switch.

5. Remove the switch to control pod retaining screws and remove the switch.

6. Installation is the reverse of removal procedure.

Bronco II and Ranger

1. Disconnect the negative battery cable(s).

2. Pull the headlamp switch knob to the full ON position. Depress the shaft release button and remove the knob and shaft assembly.

3. Remove the instrument panel finish panel.

4. Unscrew the mounting nut. Remove the switch, then remove the wiring connector from the switch.

5. Installation is the reverse of the removal procedure.

Combination Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable(s).

2. Remove the steering wheel and tilt collar shroud if so equipped. Note the position for correct installation.

3. On Aerostar remove the lock assembly.

4. Remove the switch lever by pulling it straight out from the switch.

5. Remove the steering column shroud(s).

6. Peel back the foam sight shield from the turn signal switch.

7. Remove the 2 self tapping screws that attach the switch to the lock cylinder housing and disengage the switch from the housing.

8. Disconnect the electrical connectors.

9. For installation reverse the removal procedure.

Ignition Switch

REMOVAL & INSTALLATION

1. Rotate the lock cylinder to the **LOCK** position. Disconnect the negative battery cable(s).

2. Remove the steering wheel.

3. On tilt wheel applications, remove the upper extension shroud by squeezing it at the top and bottom positions and popping it free of the retaining plate at the right.

4. Remove the 2 trim shroud halves. Disconnect the ignition switch electrical connector.

5. Drill out the break off head bolts connecting the switch to the lock cylinder housing by using a 1/8 in. drill. Remove both bolts.

Typical headlamp switch

Multi-function switch—late model Bronco II

Turn signal switch assembly

6. Disengage the ignition switch from the actuator pin.

To install:

7. Rotate the ignition key to the **RUN** position and align the holes in the switch casting base with the holes in the lock cylinder housing.

8. Install the new break off head bolts and tighten until the heads shear off. Connect the electrical connector to the ignition switch and install the steering column trim shrouds.

9. Install the lock cylinder and steering wheel assembly.

10. Reconnect the negative battery

cable(s) and check the switch for proper operation.

Stoplight Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable(s). Disconnect electrical connection from the switch. Locking tab must be lifted before connector can be removed.

2. Remove the hairpin retainer. Slide switch, master cylinder pushrod, nylon washer and bushing away from the pedal. Remove the washer, then switch by sliding switch up or down.

To install:

3. Position switch so that U-shaped side is nearest the pedal and directly over/under the pin. Then slide switch up/down installing the master cylinder pushrod and bushing between the switch side plates.

4. Push switch and pushrod assembly toward brake pedal arm. Install outside plastic washer to pin. Install the hairpin retainer (do not substitute for this retainer use only factory supplied retainer) to entire assembly.

5. Install electrical connection to switch and reconnect battery cable. Make sure switch wire harness has sufficient length to travel with switch during full stroke of brake pedal. Check switch for proper operation.

Clutch Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable(s). Disconnect the wiring harness from the switch.

2. Pull down on the orientation clip to separate it from the tab on the switch.

3. Rotate the switch to expose the plastic retainer.

4. Push the tabs together to allow the retainer to slide rearward and separate from the switch.

5. Remove the switch from the clutch master cylinder pushrod.

Brake light switch assembly

6. Installation is the reverse of the removal procedure.

Fuses And Circuit Breakers

LOCATION

The fuse panel is located on the dash panel under the instrument panel left of the steering column. Circuit breakers are located in the fuse panel.

ENGINE COOLING

Radiator

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Drain the cooling system.

2. Remove the overflow tube from the coolant recovery bottle and shroud, as necessary.

3. Remove the radiator shroud retaining bolts and position it out of the way.

4. Remove all water hoses from the radiator.

5. Disconnect and plug the automatic transmission oil cooling lines, if equipped.

6. Remove the radiator retaining bolts and tilt the radiator back to clear radiator support for removal from the vehicle.

7. Installation is the reverse of the removal procedure.

Heater Core

REMOVAL & INSTALLATION

NOTE: On vehicles equipped with air conditioning care should be exercised when removing heater core assembly.

1. Disconnect the negative battery cable(s). Allow the engine to cool down completely. Drain the cooling system to a point that is below the heater hoses.

2. Disconnect the heater hoses from the heater core tubes. Plug the core tubes.

3. From under the dash, remove the screws that attach the access cover to the plenum assembly. Remove the access cover.

4. Pull the core down and out of the plenum assembly. On Aerostar vehi-

Heater core assembly

cles depress the retainer bracket at the top of heater core.

5. Install in the reverse order. Fill cooling system, start the engine and check for leaks.

Water Pump

REMOVAL & INSTALLATION

2.0L and 2.3L Engines

1. Disconnect the negative battery cable. Drain the cooling system. Loosen and remove the drive belt.

2. Remove the bolts that retain the fan shroud and position the shroud back over the fan.

3. Remove the 4 bolts that retain the cooling fan. Remove the fan and shroud.

4. Loosen and remove the power steering and A/C compressor drive belts, if so equipped.

5. Remove the water pump pulley and the vent hose to the emissions canister.

6. Remove the heater hose at the water pump.

7. Remove the cam belt cover. Remove the lower radiator hose from the water pump.

8. Remove the water pump mounting bolts and the water pump. Clean all gasket mounting surfaces.

9. Install the water pump in the reverse order of removal. Coat the threads of the mounting bolts with sealer before installation and torque retaining bolts to 14-21 ft. lbs.

2.3L Turbocharged Diesel Engine

1. Disconnect the negative battery cables. Drain the cooling system.

2. Remove the fan and shroud assembly.

3. Remove the A/C compressor and power steering pump belt tensioner.

Typical fan clutch assembly

4. Remove the water pump pulley. Remove the A/C compressor support bracket.
5. Disconnect the lower radiator hose from the thermostat housing adapter. Remove thermostat housing and thermostat.
6. Remove upper and lower front timing covers.
7. Remove the water pump mounting bolts and the water pump. Clean all gasket mounting surfaces before installation.
8. Installation is the reverse of the removal procedure. Torque water pump retaining bolts to 14–21 ft. lbs.

2.8L Engine

1. Disconnect the negative battery cable. Drain the cooling system.
2. Loosen and remove drive belts. Remove pump pulley. Disconnect all the water hoses from the water pump and thermostat housing.
3. Remove the radiator shroud (if necessary) and cooling fan and clutch assembly. The fan clutch assembly mounting nut is equipped with a left hand thread, remove by turning clockwise.
4. Remove the mounting bolts and water pump, water inlet and thermostat housing as an assembly.
5. Clean all gasket mounting surfaces. Transfer parts to the new pump.
6. Install the water pump in the reverse order of removal. Torque water pump to front cover retaining bolts to 7–9 ft. lbs.

2.9L Engine

1. Disconnect the negative battery cable. Drain the cooling system.
2. Remove the lower radiator hose and the heater return hose from the pump.
3. Remove the fan and clutch assembly. The fan clutch assembly mounting nut is equipped with a left hand thread, remove by turning clockwise.
4. Loosen the alternator mounting bolts and remove the belt. Equipped

with A/C, remove the alternator and the bracket.

5. Remove the water pump pulley.
6. Remove the water pump attaching bolts and remove the pump assembly.
7. Installation is the reverse of removal. Torque water pump to front cover retaining bolts to 7–9 ft. lbs.

3.0L Engine

NOTE: The fan clutch assembly mounting nut is equipped with a left hand thread, remove by turning clockwise.

1. Disconnect the negative battery cable. Drain the cooling system.
2. Loosen the accessory drive belt idler and remove the belts.
3. Remove the idler bracket to the engine.
4. Disconnect the heater hose at the water pump.
5. Remove the pulley to pump hub bolts. The pulley will remain loose on the hub due to insufficient clearance between the body and the pump restricting removal.
6. Remove the water pump to engine attaching bolts (always mark or note location of bolts for correct installation) and remove the pump.
7. Installation is the reverse of removal. Torque small retaining bolts to 7 ft. lbs and long retaining bolts to 19 ft. lbs.

Thermostat

REMOVAL & INSTALLATION

NOTE: To prevent incorrect installation of the thermostat, the water outlet casting contains a locking recess into which the thermostat is turned and locked.

1. Disconnect the negative battery cable(s). Drain the radiator so that the coolant level is below the thermostat.
2. Disconnect all water hoses at the thermostat housing.
3. Remove the water outlet housing attaching bolts and pull the housing away from the engine to gain access to the thermostat.
4. Installation is the reverse of removal procedure. Fill and bleed cooling system as necessary.

Cooling System Bleeding

To bleed cooling system disconnect the heater outlet hose at the water pump to bleed or release trapped air in the system. When the coolant begins to escape, connect the heater outlet.

GASOLINE FUEL SYSTEM

Fuel Service Precautions

Always disconnect the negative battery cable if possible. Never smoke, carry lighted tobacco, open flame and keep a Class B dry chemical fire extinguisher available. Always relieve the fuel pressure before working on any fuel system component.

RELIEVING FUEL SYSTEM PRESSURE

1. Disconnect battery ground cable.
2. Remove the fuel cap from the fuel tank. Use tool T80L-9974 or equivalent attached to the pressure measuring port on the engine fuel rail.
3. Direct drain hose to a suitable container and depress the pressure relief button.
4. An alternate method is disconnect the inertia switch electrical connection and crank engine for approximately 20 seconds.

Fuel Filter

REMOVAL & INSTALLATION

Carburated Vehicle

1. Disconnect the negative battery cable. Remove the air cleaner.
2. Loosen (hold filter with back up wrench) and remove the fuel tube from the filter.
3. Remove the filter from the carburetor. If a inlet type fuel filter is used remove the fuel inlet fitting then remove the gasket, filter and spring.
4. Installation is the reverse of removal procedure. Always hand start filter threads before tightening with wrench.

Fuel Injected Vehicle

NOTE: On Aerostar vehicles, a second fuel filter is located on the

Typical location of inertia switch

Fuel line removal and installation

Reservoir type fuel filter

in-tank fuel pump. Remove the fuel pump from the tank to service this filter.

1. Relieve fuel pressure. Disconnect the battery ground cable.
2. Raise and support the vehicle safely.
3. Loosen screw clamp slide filter forward. Remove fuel lines from the filter. Some vehicles have push type connection fittings.
4. On reservoir type fuel filter remove the filter from from retainer. Note the direction of the flow arrow.
5. Remove fuel filter from mounting bracket.
6. Installation is the reverse of removal procedure. Always hand start

filter gas line threads before tightening with wrench.

Mechanical Fuel Pump PRESSURE TESTING

1. Remove the air cleaner. Connect a suitable pressure gauge to carburetor end of the fuel line.
2. Start the engine and read the fuel pressure after 10 seconds. The fuel pressure should be 5-7 psi.
3. Reconnect the fuel line and install the air cleaner.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Loosen the threaded connections and then retighten them snugly. Do not remove the lines at this time.
2. Loosen the mounting bolts about 2 turns and loosen the fuel pump from the engine.
3. Rotate the engine until the fuel pump cam lobe is near its low position.
4. Disconnect the fuel pump inlet, outlet (wrap shop towel around fitting) and vapor return line, if so equipped.
5. Remove the fuel pump attaching bolts and remove the fuel pump and gasket.
6. Installation is the reverse of removal procedure. Install the fuel

pump with a new mounting gasket and torque the retaining bolts to evenly to 14-21 ft. lbs.

Electric Fuel Pump

REMOVAL & INSTALLATION

In-Tank Pump

1. Disconnect the negative battery cable.
2. Depressurize the system and drain as much fuel from the tank by pumping out through the filler neck.
3. Raise the vehicle and safely support it.
4. Disconnect the fuel supply, return and vent lines and plug as necessary.
5. Disconnect the wiring harness to the fuel pump.
6. Support the fuel tank, loosen and remove the mounting straps. Remove the gas tank.
7. Disconnect the lines and harness at the pump flange.
8. Clean the outside of the mounting flange and retaining ring. Turn the fuel pump lock ring counterclockwise and remove.
9. Remove the fuel pump.
10. Clean the mount faces. Put a light coat of grease on the mounting surfaces and on the new sealing ring. Install the new fuel pump.
11. Installation is in the reverse order of removal. Fill the tank with at least 10 gallons of gas. Turn the ignition key ON for 3 seconds. Repeat 6 or 7 times until the fuel system is pressurized. Check for any fitting leaks. Start the engine and check for leaks.

External Pump

NOTE: The high pressure fuel pump is frame mounted and can be serviced from under the vehicle.

1. Disconnect the negative battery cable.
2. Depressurize the fuel system.
3. Raise and support the vehicle safely.
4. Disconnect the inlet and outlet fuel lines and plug as necessary.
5. Remove the pump from the mounting bracket.
6. Install in reverse order, make sure the pump is indexed correctly in the mounting bracket insulator. Always start fuel line threads by hand before tightening with wrench.

Carburetor

REMOVAL & INSTALLATION

1. Disconnect the negative battery

cable. Remove the air cleaner and duct assembly.

2. Remove the throttle cable or rod from the throttle lever. Disconnect the distributor vacuum line, EGR vacuum line, if so equipped, the inline fuel filter and the choke heat tube at the carburetor.

3. Disconnect the choke clean air tube from the air horn. Disconnect the choke actuating cable, if so equipped. Disconnect the electric choke wire at the connector, if so equipped. Disconnect the governor throttle control lines and governor wire connector at the carburetor, if so equipped.

4. Remove the carburetor retaining nuts, then remove the carburetor. Remove the carburetor mounting gasket, spacer and the lower gasket from the intake manifold.

5. Installation is the reverse of the removal procedure. Adjust the carburetor to specification, as required. Torque the carburetor mounting nuts to 14-20 ft. lbs.

IDLE SPEED ADJUSTMENT

2.0L Engine with YFA-IV and YFA-IV FB Carburetors

1. Block the wheels and apply the parking brake. Place the transmission in **N** or **P**.

2. Bring the engine to normal operating temperature.

3. Turn **OFF** the ignition key and place the A/C selector in the **OFF** position.

4. Disconnect the vacuum hose at the EGR valve and plug it.

5. Place the fast idle rpm adjusting screw on the specified step of the fast idle cam (see the underhood sticker).

6. Start the engine without touching the accelerator pedal check/adjust the fast idle rpm to specifications.

7. Reconnect the EGR vacuum hose.

8. Place the transmission in the specified position (see the underhood sticker) and check/adjust the curb idle rpm.

9. If adjustment is required, turn the hex head adjustment at the rear of the TSP housing.

10. If curb idle rpm adjustment was required and the carburetor is equipped with a dashpot, adjust the dashpot clearance as follows:

a. Turn the key to the **ON** position.

b. Open the throttle to allow the TSP solenoid plunger to extend to the curb idle position.

c. Collapse the dashpot plunger to the maximum extent. Measure the clearance between the tip of the plunger and the extension pad on the throttle vent lever.

d. If required, adjust to specifications and tighten the dashpot locknut

11. If curb idle adjustment was required, check/adjust the bowl vent setting as follows:

a. Turn ignition key to the **ON** position to activate the TSP (engine not running). Open throttle to allow the TSP solenoid plunger to extend to the curb idle position.

b. Secure the choke plate in the wide open position.

c. Open throttle so that the throttle vent lever does not touch the bowl vent rod. Close the throttle to the idle set position and measure the travel of the fuel bowl vent rod from the open throttle position.

d. Travel of the bowl vent rod should be within specification (0.100-0.150 in.).

e. If out of specification, bend the throttle vent lever at notch to obtain required travel.

10. Remove all test equipment and reinstall air cleaner assembly. Tighten the holddown bolt.

2.8L Engine with 2150 2VFB Carburetor

1. Set parking brake and block wheels.

2. Put the transmission in **P**.

3. Bring the engine to normal operating temperature.

4. Disconnect the electric connector on the EVAP purge solenoid.

5. Disconnect and plug the vacuum hose to the VOTM kicker.

6. Place the transmission in **D** position.

7. Check/adjust curb idle rpm, if adjustment is required:

a. Use the curb idle speed screw.

b. Use the saddle bracket adjusting screw.

8. Place the transmission in **N** or **P**. Rev the engine momentarily. Place the transmission in **D** position and recheck curb idle rpm. Readjust if required.

9. Remove the plug from the vacuum hose to the VOTM kicker and reconnect.

10. Reconnect the electrical connector on the EVAP purge solenoid. Remove all test equipment and road test to check for proper operation.

IDLE MIXTURE ADJUSTMENT

Propane Enrichment Method

NOTE: Remove the air cleaner when necessary to perform adjustments. Use this service and adjustment procedure as a guide.

1. Bring the engine to normal operating temperature and connect a tachometer.

2. Disconnect the evaporative emission purge hose from the air cleaner. Disconnect the PCV closure hose from the air cleaner and plug the hose.

3. Adjust the curb idle speed to specifications.

4. If vehicle is equipped with thermactor system, revise the dump valve vacuum hoses as follows:

a. For dump valves with 2 vacuum fittings, disconnect and plug the hose(s).

b. For dump valves with 1 fitting, remove the hose at the dump valve and plug it. Connect a slave hose from the dump valve vacuum fitting to an intake manifold vacuum fitting.

5. Place the special gas tool into the air cleaner evaporative purge nipple. With the engine idling, slowly open the propane valve until the engine speed reaches a maximum and then begins to drop. Note the maximum speed increase. If the speed will not drop, check the bottle gas supply. If necessary, repeat the operation with a new bottle gas supply.

a. If the speed increase is within specifications, but not zero rpm, proceed to Step 6. If the speed increase is zero and minus specification is zero, proceed to Step 5d.

b. If the speed increase is higher than specification; enrich the mixture without propane by turning the mixture limiter screws counterclockwise in equal amounts until the rpm increases as necessary. Example: If the increase was 80 rpm and the desired reset is 50 rpm, the mixture screws should be richened to attain a 30 rpm increase. Repeat Steps 3 and 5.

c. If the speed increase is lower than specifications proceed as follows; lean the mixture without propane by turning the mixture screws clockwise in equal amounts until the rpm decreases as necessary. Example: If the increase was zero rpm and the desired reset increase is 20 rpm, the mixture screws should be leaned to attain a 20 rpm decrease. Repeat Steps 3 and 5.

d. If the speed increase is zero rpm and the minimum speed gain specification is zero, perform the following speed drop test; Turn the mixture limiters counterclockwise to the maximum rich position. (If the limiters have been removed, do not enrich; assume the mixture screws are already set at the maximum rich position.) Lean the idle fuel mixture by turning the screws clockwise equally as specified. Note

the drop in engine rpm.

e. If the speed drop is equal to or greater than the specified minimum speed drop, return the mixture limiters to the maximum rich position or the mixture screws to the "assumed" maximum rich position. If the engine speed before mixture adjustment was 650 rpm and the speed drop specification is 100 rpm minimum, proceed to Step 6 if the engine speed drops to at least 550 rpm or stalls.

f. If the speed drop is less than the specified minimum speed drop, leave the mixture limiters or screws in the adjusted position and repeat Steps 3 and 5.

6. If the idle limiters were removed, install new blue service limiters at the maximum rich stop. Check the speed increase after installation of the limiters to be certain that the settings were not disturbed. If the setting is within specification, proceed to Step 7, if not correct as required.

7. Remove the gas tool from the nipple and connect all system components that were removed.

8. Set the curb idle speed to specification if Step 3 required an idle speed adjustment.

9. Turn off the engine and disconnect the tachometer. Remove the limiter caps with appropriate tool if required. Road test the vehicle for proper operation.

SERVICE ADJUSTMENTS

For all carburetor service adjustments procedures and specifications, please refer to "Carburetor Service" in the Unit Repair section.

Fuel Injection

IDLE SPEED ADJUSTMENT

1. Disconnect idle speed control air bypass solenoid.

2. With transmission in N or P race engine for 30 seconds at 2500 rpm then let engine idle for 2 minutes.

3. Place automatic transmission in D and manual transmission in N. Check/adjust idle speed by turning the throttle plate stop screw as necessary.

4. Repeat Steps 2 and 3. Turn engine to OFF position and disconnect battery for 3 minutes on 2.9L and 3.0L engines.

5. With engine OFF reconnect idle speed control air bypass solenoid. Verify that the throttle and linkage is operating properly.

6. Start engine and let engine stabilize for 2 minutes. Road test the vehicle to check for proper operating conditions.

Idle speed adjustment-2.3L engine

Idle speed adjustment-2.9L engine

Idle speed adjustment-3.0L engine

cle to check for proper operating conditions.

Fuel Injector

REMOVAL & INSTALLATION

NOTE: To remove a injector grasp injector body, pull up while gently rocking injector from side to side. Use a light twisting pushing motion to install a injector.

1. Disconnect the negative battery cable.

2. Release the pressure from the fuel system.

3. Remove the upper intake manifold (air intake manifold) as follows:

a. Disconnect the electrical connectors at the air bypass valve, throttle position sensor, EGR position sensor and air charge temperature sensor.

b. Remove the air inlet tube from the air cleaner to throttle body.

c. Remove protective shield. Disconnect the throttle linkage at the throttle ball.

d. Disconnect all vacuum lines to the upper intake, EGR valve and the fuel pressure regulator.

e. Disconnect the PCV system hose from the rear of the upper manifold.

f. Remove the canister purge lines from the fitting near power steering pump. Disconnect the EGR tube from the valve by removing the flange nut. Remove A/C line retaining bolt clamp if so equipped.

g. Remove the upper intake manifold retaining bolts and remove it and the throttle body as an assembly.

4. Remove the fuel supply manifold as follows:

a. Disconnect the fuel chassis inlet and outlet fuel hoses from the fuel supply manifold.

b. Disconnect the fuel supply and the return line connections.

c. Remove the fuel supply manifold retaining bolts. Remove the fuel supply manifold electrical harness connectors from the injectors and remove the injector retaining clips. Remove the injectors.

6. Installation is the reverse of the removal procedure. Never use silicone grease on injector O-rings it may clog the injectors. Torque the upper manifold retaining bolts to 15-22 ft. lbs. on 2.3L engine. Torque the upper manifold retaining bolts to 11-15 ft. lbs. on 2.9L engine. Torque the air intake manifold (upper manifold) retaining bolts to 19 ft. lbs. on 3.0L engine.

DIESEL FUEL SYSTEM

Fuel Filter

REPLACEMENT

1. Disconnect the battery ground cables from both batteries.

2. Remove the fuel filter rear bracket shield and all attaching components. Remove the fuel lines from the the filter element.

3. Remove the hold down clamps from rectangular filter element. Remove the filter element from base.

4. Installation is the reverse of the removal procedure.

Upper intake manifold assembly-2.9L engine

Fuel supply manifold assembly-2.9L engine

Purging Air And Priming Fuel Filter

1. Turn ignition to the **ON** position.
2. Loosen the air vent plug on filter housing until fuel flows from the air vent plug hole free of bubbles.
3. Tighten air vent plug. Start the engine and check for fuel leaks.

Diesel Injection Pump

REMOVAL & INSTALLATION

1. Disconnect the negative battery cables.
2. Remove radiator fan and shroud.

3. Loosen and remove accessory drive belts.
4. Rotate crankshaft in direction of engine rotation to bring No. 1 piston to TDC on compression stroke.
5. Remove upper front timing cover.
6. Loosen and remove timing belt from injection pump.
7. Remove nut attaching sprocket to injection pump.
8. Install puller T77F-4220-B1, or equivalent and remove sprocket.
9. Disconnect throttle cable and speed control cables, if so equipped.
10. Disconnect coolant hoses from injection pump wax element.

Fuel filter assembly

Installing Injection pump

11. Disconnect hoses from boost compensator and A/C throttle kicker.
 12. Disconnect fuel return line at injection pump from injection return pipe.
 13. Disconnect chassis fuel return line from injection pump.
 14. Disconnect and cap fuel supply line from fuel filter.
 15. Disconnect and remove fuel lines at injection pump and nozzles. Cap all lines and fittings using protective cap set, T85T-9395-A or equivalent.
 16. Remove 2 nuts attaching injection pump to rear front case. Remove 2 injection pump bracket-to-engine bracket bolts and 2 engine bracket-to-engine block bolts. Remove the injection pump.
- To install:**
17. Position injection pump on engine and install 2 nuts attaching injection pump to engine rear front cover. Position injection pump bracket-to-engine bracket on engine block and install 2 bolts.
 18. Install 2 injection pump bracket-to-engine bracket bolts.
 19. Install injection pump sprocket. Tighten nut to 40-50 ft. lbs.
 20. Install and adjust timing belt.
 21. Adjust injection pump timing.
 22. Tighten the injection pump re-

Idle speed setting screw—2.3L diesel engine

taining nuts and bolts after adjustment procedure.

23. Install injection lines on injection pump and nozzles.

24. Install fuel supply line and fuel return line on injection pump.

25. Connect nozzle returning line to injection pump.

26. Connect hoses to boost compensator and A/C throttle kicker.

27. Connect coolant hoses to injection pump wax element.

28. Connect throttle cable and speed control cable, if so equipped.

29. Install upper front cover and accessory drive belts.

30. Install radiator fan and shroud. Connect battery ground cables to both batteries. Run engine and check for fuel and coolant leaks. Bleed all systems as necessary. Road test the vehicle for proper operation.

IDLE SPEED ADJUSTMENT

1. Run engine to normal operating temperature. Idle speed is determined with manual transmission in neutral position.

2. Check that curb idle adjusting screw is against the stop correct if necessary.

3. Check idle speed, using tachometer or equivalent test equipment. Idle speed is specified on the Vehicle Emissions Control Information decal. Adjust to specification using idle speed adjusting screw.

4. Roadtest to check for proper operation of the vehicle.

Diesel Injection Timing

ADJUSTMENT

1. Remove top timing belt cover.

2. Rotate engine until No. 1 piston is at TDC on the compression stroke. Verify by checking timing marks.

3. If engine temperature is below 122 degrees Fahrenheit the cold start mechanism as follows. Install a suit-

Timing mark alignment

Bypass cold start device

Timing adapter and dial indicator installation

able tool and rotate the fast idle lever. Insert a spacer or a tool at least 7mm thick between cold start advance lever and the cold start device.

4. Loosen, but do not remove, the 2 mounting bolts and 2 nuts attaching the injection pump to the mounting bracket and front cover.

5. To prevent the delivery valve holders from turning with the fuel line nuts, loosen, but do not remove, the nuts securing the fuel lines to the injection pump using a backup wrench.

6. Remove the timing plug bolt from the center of the fuel injection pump hydraulic head.

7. Install adapter Rotunda tool model 014-00303 or equivalent, into the port in the hydraulic head.

8. Mount tool D82L-1201-A or equivalent dial indicator, in timing adapter with a minimum preload of 0.010 in. (0.25mm).

9. Rotate the crankshaft approximately 30 degrees counterclockwise. Position the dial indicator to zero.

10. Rotate the crankshaft clockwise to 5 degrees ATDC and check that the dial indicator indicates 0.0394 in. plus or minus 0.0011 in.

11. If the timing is out of specification, rotate the injection pump body until the dial indicator indicates specification. Rotate the pump clockwise if the reading is more than specification, or counterclockwise if less than specification. Tighten the injection pump mounting nuts to 11-15 ft. lbs. and tighten the bolts to 15-19 ft. lbs.

12. After tightening injection pump mounting bolts and nuts, repeat Steps 9 and 10 to ensure that the injection timing has not changed.

13. Tighten the fuel line nuts at the injection pump to 17-26 ft. lbs.

14. Using a new copper gasket, install the injection timing plug bolt and tighten to 10-14 ft. lbs.

15. Install the upper timing belt cover.

16. Run the engine and check for fuel leaks at the injection pump.

Fuel Nozzles

REMOVAL & INSTALLATION

NOTE: Before removing nozzle assemblies, clean exterior of each nozzle assembly and the surrounding area with solvent to prevent entry of dirt into engine when nozzle assemblies are removed. Always cap all open fuel lines to prevent dirt from entering system.

1. Disconnect battery ground cables from both batteries.

2. Disconnect and remove injection lines from injection nozzles and injection pump. Cap all lines and fittings as required.

3. Remove fuel return pipe and gaskets.

4. Remove nozzles, using a 21mm deep well socket. Remove holder gasket and nozzles gasket, using a suitable tool.

To install:

5. Install new nozzle gasket and holder gasket in cylinder. Install nozzles.

7. Install fuel return pipe using new gaskets. Tighten nuts to 22-28 ft. lbs.

8. Install injection lines on nozzle and fuel injection pump and tighten line nuts.

9. Connect battery ground cables to both batteries.

10. Run engine and check for fuel leaks.

EMISSION CONTROLS

Please refer to "Emission Control" in the Unit Repair section for system maintenance procedures. Due to the complex nature of modern electronic engine control systems, comprehensive diagnosis and testing procedures fall outside the confines of this repair manual. For complete information on diagnosis, testing and repair procedures concerning all modern engine and emission control systems, please refer to "Chilton's Guide to Electronic Engine Controls".

Emission Warning Lamps

RESETTING

NOTE: The Emission Maintenance Warning (EMW) Light System consists of an instrument panel mounted amber lens light that is electrically connected to a sensor module located under the instrument panel near glove box.

1. Turn the key switch to the **OFF** position.
2. Lightly push a tool through the 0.2 in. diameter hole with the sticker labeled "RESET" and press down and hold.
3. While pressing the tool down, turn the keyswitch to the **RUN** position. The Emission Maintenance Warning (EMW) lamp will then light and remain lit for as long as the tool is pressed down.
4. Hold the tool down for 5 seconds. Remove the tool. The lamp should go out within 2 to 5 seconds indicating a reset has occurred.
5. Turn the keyswitch to the **OFF** position then turn the keyswitch to the **RUN** position. The EMW lamp will light for 2-5 seconds and will then go out. This verifies that a proper reset of the module has been accomplished.

GASOLINE ENGINE MECHANICAL

Engine

REMOVAL & INSTALLATION

Aerostar

2.3L ENGINE

NOTE: The engine removal procedure requires that the engine and front suspension subframe be removed from beneath the vehicle. Mark or tag all electrical and vacuum connections before disconnection to make installation easier.

1. Disconnect the negative battery cable.
2. Loosen the draincock and drain the coolant from the radiator.
3. Disconnect the air cleaner outlet tube at the throttle body and the idle speed control hose.
4. Remove the upper and lower hoses from the radiator and engine. Disconnect the lower intake manifold hose from the tee fitting in the heater hose.
5. Remove the bolts retaining the fan shroud to the radiator, remove the fan shroud.
6. Disconnect the electrical connectors to the alternator.
7. Remove the throttle linkage shield and disconnect the accelerator cable and cruise control (if equipped) from the throttle body. Unbolt the cables from the bracket and position them out of the way.
8. If equipped with air conditioning, discharge the system. After discharging, disconnect the suction and discharge hoses from the compressor. Disconnect the A/C compressor clutch electrical connector from the compressor.
9. From the lower left front of the engine, disconnect the electrical connector for the coil.
10. From beneath the lower intake manifold, disconnect the electrical connector for the TFI module on the distributor.
11. Disconnect the electrical connector from the knock sensor on the side of the upper intake manifold.
12. Tag and disconnect all hoses to the vacuum tree at the top of the upper intake manifold.
13. Disconnect the electrical connector and vacuum hose from the exhaust gas recirculation (EGR) valve at the rear of the upper intake manifold.
14. Remove the engine cover from inside the cab.
15. Disconnect the electrical connector for the throttle position sensor (TPS) at the rear of the throttle body.
16. Disconnect the electrical elbow connector for the oil pressure sender at the left rear of the engine.
17. Relieve the fuel system pressure. Disconnect the fuel return and supply lines.
18. Disconnect the electrical connector for the fuel injection wiring harness.
19. Disconnect the electrical connector for the air charge temperature (ACT) sensor at the rear side of the lower intake manifold.
20. Disconnect the electrical connector for the coolant temperature sensor at the center of the lower intake manifold.
21. Remove the nut and disconnect the ground strap from the right rear side of the engine below the lifting eye.
22. If equipped with manual transmission, place the shift lever in neutral position and remove the bolts retaining the shift lever to the floor. Remove the bolts retaining the shift lever assembly to the transmission and remove the lever assembly.
23. Raise the vehicle and safely support.
24. If equipped with automatic transmission, disconnect and plug the fluid lines at the radiator.
25. If equipped with power steering, disconnect the electrical connector for the power steering pressure switch from the gear.
26. Remove the bolt retaining the intermediate steering column shaft to the steering gear and disconnect the shaft from the gear. The steering wheel and wheels should be straight ahead (centered) prior to removal.
27. Remove the bolts and disconnect the starter cable and ground cable from the starter. Route the ground and starter cables out from the crossmember.
28. On vehicles equipped with manual transmission, remove the lockpin retaining the hydraulic hose to the clutch slave cylinder in the clutch housing. Remove and plug the hose.
29. Disconnect the electrical connector for the exhaust gas oxygen sensor at the exhaust manifold.
30. Loosen and remove the exhaust manifold stud nuts. Remove the bolts and nuts retaining the catalytic converter pipe to the muffler and outlet pipe. Disconnect and remove the exhaust pipe and catalytic converter.
31. Disconnect the speedometer and/or tachometer cable from the trans-

mission. Disconnect the electrical connector from the backup lamp switch.

32. On manual transmissions, disconnect the electrical connector for the shift indicator sender.

33. On automatic transmissions, disconnect the electrical connector for the neutral start switch. Disconnect the throttle and kickdown cable from the transmission lever. Route the kickdown cable out of the engine compartment and remove the cable.

34. Remove the nuts and U-bolts retaining the driveshaft to the rear axle yoke and remove the driveshaft. Insert a plug in the extension housing to prevent fluid leakage.

35. Remove the lug nuts and remove both front wheel and tire assemblies.

36. Remove the bar nuts and disconnect the stabilizer bar from the lower control arms. Discard the bar nuts.

37. Disconnect the brake lines at the bracket on the frame behind the spindles.

38. Position a jack under the lower control arm and raise the arm until tension is applied to the coil spring. Remove the bolt and nut retaining the spindle to the upper control arm ball joint. Slowly lower the jack under the lower control arm to disconnect the spindle from the ball joint. Place safety chains around the lower arms and spring upper seat.

39. Position a jack under the transmission and slightly raise the transmission. Remove the nuts and bolts retaining the crossmember to the frame and the nuts retaining the transmission to the crossmember. Remove the crossmember.

40. If required, remove the transmission. The engine may be removed with the transmission removed or attached.

41. Position a suitable dolly under the crossmember and engine assembly.

42. Slowly lower the vehicle until the crossmember rests on the dolly. Place wood blocks under the front crossmember and the rear of the engine block (or transmission, if installed) to keep the engine and crossmember assembly level. Install safety chains around the engine and dolly.

43. With the engine and crossmember securely supported on the dolly, remove the three nuts from the bolts that retain the engine and crossmember assembly to the frame on each side of the vehicle.

44. Slowly raise the body off the engine and crossmember assembly on the dolly. Make sure that any wiring or hoses do not interfere with the removal process.

45. With the engine and crossmember assembly clear of the vehicle, roll the dolly out from under the van.

46. Connect a lifting chain to the lifting eyes on the right rear and front left portions of the engine. Attach the chain to a suitable chain hoist or shop crane.

47. If equipped with power steering, disconnect the hoses from the pump and plug them to prevent the entry of dirt.

48. With lifting tension applied, remove the nuts retaining the engine to the crossmember assembly, then lift the engine off the crossmember.

49. Remove the required components to attach the engine assembly to a suitable engine stand if required.

To install:

50. Attach a lifting chain and shop crane to the engine. Remove the bolts retaining the engine to the engine stand and lift the engine with the shop crane.

51. With the front crossmember securely positioned on a dolly, slowly lower the engine until the motor mount studs are piloted in the crossmember holes. Install the remaining nuts and tighten them to 45–65 ft. lbs.

52. Install wood blocks under the oil pan and/or transmission and crossmember, then remove the lifting chain and shop crane.

53. If equipped with power steering, connect the hoses to the power steering pump.

54. Position the support dolly under the vehicle. Make sure the van body is securely supported. Align the dolly so that the engine/subframe assembly is correctly lined up with the 3 mounting bolts on each side of the frame. The bolts should align with the holes in the crossmember.

55. Slowly lower the body so the bolts are piloted in the crossmember holes. Continue lowering until the crossmember is against the frame. Install the nuts retaining the crossmember to the frame and tighten them to 187–260 ft. lbs.

56. Raise the vehicle and remove the support dolly.

57. Install the transmission as required.

58. Position a transmission jack under the transmission and slightly raise the transmission to place the crossmember in position on the frame and transmission. Install the retaining nuts and bolts to the crossmember, then install the nut retaining the transmission mount and insulator to the crossmember and tighten to 71–94 ft. lbs.

59. Remove the safety chains from around the lower control arm and upper spring seat.

60. Install a floor jack under the lower control arms. Slowly raise the control arm until the coil spring is un-

der tension. Continue to raise the arm until the spindle upper arm can be connected to the upper control arm ball joint. Install a new nut and bolt.

61. Connect the stabilizer bar to the lower control arms. Install new bar nuts.

62. Connect the front brake lines to the caliper hoses at the frame brackets.

63. Install the front wheels.

64. Connect the driveshaft to the transmission and rear axle yoke. Install the nuts and U-bolts retaining the driveshaft to the rear axle yoke.

65. On vehicles with automatic transmission, connect the throttle and kickdown cables to the transmission lever. Connect the electrical connector to the neutral start switch and route the kickdown cable into the engine compartment.

66. On manual transmissions, connect the electrical connector for the shift indicator sender.

67. Connect the speedometer and/or tachometer to the transmission, then connect the electrical connector for the backup lamp switch.

68. Install new gaskets on the exhaust manifold and catalytic converter. Place the assembly in position on the exhaust manifold, muffler and outlet pipe. Install the 2 nuts and bolts retaining the converter to the muffler and outlet pipe. Install the nuts retaining the pipe to the exhaust manifold and tighten alternately.

69. Connect the electrical connector for the exhaust gas oxygen sensor on the exhaust manifold.

70. On manual transmissions, attach the hydraulic hose to the slave cylinder in the clutch housing. Install the lockpin retaining the hose to the cylinder.

71. Position the ground cable on the starter and install and tighten the mounting bolt. Connect the starter cable to the motor and install the screw and washer. Route the starter and ground cables over the crossmember and into position in the engine compartment.

72. With the front wheels and steering wheel centered (straight ahead), connect the steering column lower shaft to the steering gear. Install the bolt and tighten it to 31–42 ft. lb.

73. If equipped with power steering, connect the power steering pressure switch at the gear.

74. If equipped with automatic transmission, connect the fluid lines at the radiator.

75. Lower the vehicle.

76. From inside the cab, if equipped with manual transmission, position the shift lever assembly on the transmission. Make sure the transmission

and shifter are in the neutral position. Install and tighten the retaining bolts to 6–9 ft. lbs. Position the boot over the lever assembly.

77. On the right rear side of the engine below the lifting eye, position the ground strap on the lifting eye, then install and tighten the retaining nut.

78. In the center of the lower intake manifold, connect the electrical connector for the coolant temperature sensor.

79. Connect the electrical connector for the air charge temperature (ACT) sensor at the rear side of the lower intake manifold.

80. Connect the electrical connector for the fuel injection wiring harness.

81. Connect the hoses to the fuel return and fuel supply lines.

82. Connect the electrical connector for the oil pressure sender at the left rear side of the engine.

83. Connect the electrical connector for the throttle position sensor (TPS) at the rear of the throttle body.

84. Install the engine cover inside the cab.

85. Connect the electrical connector and vacuum hose for the EGR valve at the rear of the upper intake manifold.

86. Connect all vacuum hoses in their proper positions on the vacuum tree at the top of the upper intake manifold.

87. Connect the electrical connector for the knock sensor at the side of the upper intake manifold.

88. Connect the electrical connector for the Thick Film Ignition (TFI) module on the distributor, underneath the lower intake manifold.

89. Connect the electrical connector for the coil at the lower left front side of the engine.

90. If equipped with air conditioning, connect the A/C clutch compressor connector to the compressor. Connect the suction and discharge hoses to the compressor and recharge the A/C system.

91. Connect the accelerator cable and cruise control cable (if equipped) to the throttle body. Install the cables in the retaining bracket and install and tighten the bolt. Install the throttle linkage shield.

92. Connect the 2 electrical connections to the alternator.

93. Connect the electrical connector and vacuum hose to the manifold absolute pressure (MAP) sensor.

94. Position the fan shroud on the radiator, then install and tighten the retaining bolts.

95. Install the upper and lower radiator hoses and the heater hoses. Install the lower intake manifold hose to the tee in the heater hose.

96. Connect the air cleaner tube at

the throttle body and the idle speed control hose. Install the ground cable on the negative battery terminal.

97. Fill the cooling system to the specified level with approved coolant. Check and adjust all fluid levels as required. Bleed the brake system.

98. Start the engine and check for leaks. Correct as required. The front end alignment should be checked and adjusted as soon as possible.

2.8L AND 3.0L ENGINES

NOTE: The engine removal procedures for the 2.8L and 3.0L are basically identical with the exception of the fuel system. The 2.8L engine uses a carburetor, while the 3.0L engine is equipped with fuel injection. The engine is removed from the bottom along with the subframe and front suspension.

1. Disconnect the negative battery cable.

2. Loosen the draincock and drain the coolant from the radiator.

3. Remove the air cleaner and intake duct assembly.

4. Disconnect the upper and lower hoses at the radiator.

5. Remove the fan shroud retaining bolts and remove the shroud.

6. On 2.8L engines, disconnect the manifold absolute pressure (MAP) sensor electrical connector from the sensor, located on the dash panel.

7. If equipped with air conditioning, disconnect the A/C clutch electrical connector from the compressor. On the 2.8L engine, loosen the idler pulley adjustment bolt to slacken drive belt tension and remove the belt from the compressor clutch pulley, then remove the compressor mounting bolts and position the compressor out of the way. On the 3.0L engine, discharge the A/C system and disconnect the compressor discharge and suction hoses from the compressor.

8. Disconnect the accelerator cable and the transmission kickdown cable at the throttle lever ball stud or throttle body.

9. Disconnect the electrical connector for the idle speed control (ISC) motor on 2.8L engine or the idle air control (IAC) valve on 3.0L engine.

10. Disconnect the electrical connectors for the engine coolant temperature sensor and the water temperature sender switch, located in the thermostat housing.

11. Disconnect the vacuum hose from the exhaust gas recirculation (EGR) valve and the electrical connector from the EGR valve position sensor.

12. Disconnect the electrical connectors from the alternator.

13. On the 2.8L engine, tag and disconnect the electrical connectors for the throttle position sensor on the carburetor choke shield, canister purge valve solenoid and the solenoid valve carburetor bowl vent. Disconnect the electrical connector to the variable voltage choke cap. Disconnect the evaporative emission hose from the solenoid valve carburetor bowl vent to the vapor storage canister. Route the wiring harness out of the engine compartment.

14. Remove the engine cover from inside the cab.

15. On the 3.0L engine, tag and disconnect the evaporative emission line, fuel injector wiring harness (including 6 injectors), air charge temperature sensor, throttle position sensor and the radio frequency suppressor, if equipped.

16. Remove the retaining bolt, then remove the bracket and accelerator cable and transmission kickdown linkage.

17. If equipped with cruise control, disconnect the cruise control cable from the throttle linkage.

18. Disconnect the electrical connector and suppressor wire from the ignition coil.

19. On the 2.8L engine, disconnect the hose from the air control valve to the catalytic converter.

20. Disconnect the electrical connector for the Thick Film Ignition (TFI) module at the distributor. Disconnect the electrical connector for the knock sensor on the 3.0L engine.

21. On the 2.8L engine, disconnect the electrical connector for the feedback control solenoid at the rear of the carburetor.

22. Tag and disconnect all the hoses from the vacuum manifold fitting.

23. Disconnect the brake booster vacuum hose from the clip.

24. If equipped with manual transmission, place the shift lever in neutral and remove the bolts retaining the shift lever to the floor. Remove the bolts retaining the shift lever assembly to the transmission and remove the lever assembly.

25. Raise the vehicle and support it safely.

26. If equipped with automatic transmission, disconnect the fluid lines at the radiator.

27. Remove the heater hoses from the bracket underneath the engine at the front of the crossmember.

28. Make sure the steering wheel and front wheels are straight ahead (centered), then remove the bolt retaining the intermediate steering column shaft to the steering gear and disconnect the shaft from the gear.

29. Disconnect the elbow connector

from the oil pressure sender beneath the fuel pump on the 2.8L engine, or the oil pressure sending switch connector on the 3.0L engine.

30. On the 2.8L engine, disconnect and plug the inlet hose on the fuel pump from the lines on the frame. On the 3.0L engine release the fuel system pressure. Disconnect the fuel delivery and return lines.

31. Remove the bolt retaining the ground strap to the engine and remove the strap.

32. Remove the bolts and disconnect the starter cable and ground cable from the starter. Route the ground and starter cables out from the crossmember.

33. On vehicles with manual transmission, remove the lockpin retaining the hydraulic hose to the slave cylinder in the clutch housing. Remove and plug the hose.

34. Disconnect the electrical connector for the exhaust gas oxygen sensor from the left exhaust manifold. Disconnect the electrical connector for the knock sensor from the engine block above the starter.

35. Loosen and remove the exhaust manifold stud nuts. On the 2.8L engine, disconnect the tube to the check valve on the managed thermactor air tube. Remove the bolts and nuts retaining the catalytic converter pipe to the muffler and outlet pipe. Disconnect and remove the exhaust pipe and catalytic converter.

36. Disconnect the speedometer cable from the transmission. Disconnect the electrical connector from the backup lamp switch.

37. On manual transmissions, disconnect the electrical connector for the shift indicator sender.

38. On automatic transmissions, disconnect the electrical connector for the neutral start switch. Disconnect the throttle and kickdown cable from the transmission lever. Route the kickdown cable out of the engine compartment and remove the cable.

39. Remove the nuts and U-bolts retaining the driveshaft to the rear axle and remove the driveshaft. Insert a plug in the extension housing to prevent fluid leakage.

40. Remove the front wheel assemblies.

41. Remove the bar nuts and disconnect the stabilizer bar from the lower control arms. Discard the bar nuts.

42. Disconnect and plug the brake lines at the bracket on the frame behind the spindles.

43. Position a jack under the lower control arm and raise the arm until tension is applied to the coil spring. Remove the bolt and nut retaining the spindle to the upper control arm ball

joint. Slowly lower the jack under the lower control arm to disconnect the spindle from the ball joint. Place safety chains around the lower control arms and spring upper seat.

44. Position a transmission jack under the transmission and slightly raise the transmission. Remove the nuts and bolts retaining the crossmember to the frame and the nuts retaining the transmission to the crossmember. Remove the crossmember.

45. Remove the transmission as required.

46. Position a wheeled dolly under the crossmember and engine assembly.

47. Slowly lower the vehicle until the crossmember rests on the dolly. Place wood blocks under the front crossmember and the rear of the engine block (or transmission, if installed), to keep the engine and crossmember assembly level. Install safety chains around the crossmember and dolly.

48. With the engine and crossmember securely supported on the dolly, remove the 3 nuts from the bolts that retain the engine and crossmember assembly to the frame on each side of the vehicle.

49. Slowly raise the body off the engine and crossmember assembly on the dolly. Make sure that any wiring or hoses do not snag or interfere with the removal process.

50. When the engine and crossmember assembly are clear of the van body, roll the dolly out from under the vehicle.

51. Install lifting eyes on each side of the exhaust manifold, then connect a suitable chain to the lifting eyes and attach a shop crane or chain hoist.

52. If equipped with power steering, disconnect the power steering hoses from the pump to the gear and plug the hose ends.

53. With lifting tension applied, loosen the nuts retaining the motor mounts to the crossmember and lift the engine off the crossmember.

54. Remove the necessary components to attach the engine to a suitable engine stand. Make sure the engine is securely bolted to the stand before releasing tension on the hoist.

To install:

55. Attach a suitable shop crane or chain hoist and remove the engine from the work stand.

56. With the front crossmember securely attached to a wheeled dolly, slowly lower the engine until the motor mount studs are piloted in the crossmember holes. Install the retaining nuts and tighten them to 71-94 ft. lbs. Install wood blocks under the oil pan and crossmember to level the as-

sembly, then detach the lifting chain and hoist. Remove the lifting eyes.

57. If equipped with power steering, attach the hoses to the pump and gear. Roll the dolly under the vehicle and make sure the 3 mounting bolts on each side of the frame are in alignment with the holes in the crossmember.

58. Slowly lower the body so the bolts are piloted in the crossmember holes. When the crossmember is against the frame, install the retaining nuts and tighten them to 187-260 ft. lbs. Raise the vehicle and remove the dolly.

59. If removed, install the transmission.

60. Position a transmission jack under the transmission and slightly raise the transmission. Place the crossmember in position in the frame and on the transmission, then install the nuts retaining the transmission mount and insulator to the crossmember. Tighten the retaining nuts to 71-94 ft. lbs.

61. Remove the safety chains from around the lower control arms and spring seat.

62. Install a jack under the lower control arms, then slowly raise the control arm until the coil spring is under tension. Continue to raise the arm until the spindle upper arm can be connected to the lower control arm ball joint. Install a new nut and bolt.

63. Connect the stabilizer bar to the lower control arms. Install new bar nuts.

64. Connect the front brake lines to the caliper hoses at the frame brackets.

65. Install the front wheels.

66. Connect the driveshaft to the rear axle and transmission. Install the nuts and bolts retaining the driveshaft to the rear axle end yoke.

67. If equipped with automatic transmission, connect the throttle and kickdown cables to the transmission lever. Connect the electrical connector for the neutral start switch and route the kickdown cable into the engine compartment.

68. On manual transmissions, connect the electrical connector for the shift indicator sender.

69. Connect the cable/electrical sender for the speedometer to the transmission. Connect the electrical connector for the backup lamp switch.

70. Install new gaskets on the exhaust manifold and catalytic converter. Install the nuts and bolts retaining the converter to the muffler and outlet pipe. Install the nuts retaining the pipe to the exhaust manifold and tighten alternately.

71. Connect the electrical connectors for the exhaust gas oxygen sensor and the knock sensor.

72. On manual transmissions, attach the hydraulic hose to the slave cylinder in the clutch housing. Install the lockpin retaining the hose to the cylinder. Bleed the clutch hydraulic system.

73. Position the ground cable on the starter and tighten the mounting bolt. Connect the starter cable to the motor and install the screw and washer and tighten. Route the starter and ground cables over the crossmember and into position in the engine compartment.

74. Position the ground strap on the engine and install and tighten the bolt.

75. On the 2.8L engine, connect the fuel pump inlet hose to the line on the frame. On the 3.0L engine, reconnect the fuel return and delivery lines.

76. Connect the elbow connector to the oil pressure sender beneath the fuel pump.

77. With the front wheel and steering wheel straight ahead (centered), connect the steering column intermediate shaft to the steering gear. Install and tighten the bolt to 30–42 ft. lbs.

78. Install the heater hoses to the bracket underneath the engine at the front of the crossmember.

79. If equipped with automatic transmission, connect the fluid lines at the radiator.

80. Lower the vehicle.

81. From inside the cab, connect the brake vacuum booster hose to the vacuum manifold fitting on the rear of the engine. Connect the hose to the clip. If equipped with cruise control, connect the vacuum hose from the cruise control to the fitting. Make sure all hoses disconnected prior to engine removal are connected to their correct ports.

82. On the 2.8L engine, connect the electrical connector for the feedback control solenoid at the rear of the carburetor. On the 3.0L engine, connect the fuel injection wiring harness and all injectors.

83. Connect the electrical connector for the Thick Film Ignition (TFI) module at the distributor. On the 2.8L engine, connect the hose for the air control valve to the catalytic converter. Connect the electrical connector and suppressor wire to the coil.

84. Connect the cruise control cable to the carburetor or throttle body assembly. Position the accelerator and kickdown cables in the bracket and install the bolt.

85. If equipped with manual transmission, position the shift lever assembly on the transmission. Make sure the transmission and shifter assembly are in neutral, then install and tighten the retaining bolts. Position the boot over the lever assembly.

86. Reconnect all remaining wiring connectors accessible from the top of the engine, then replace the engine cover in the cab.

87. Route the wiring into position in the engine compartment.

88. On the 2.8L engine, connect the electrical connectors for the throttle position sensor, canister purge valve solenoid and solenoid valve/carburetor bowl vent. Connect the elbow connector to the variable voltage choke cap, then connect the evaporative emission hose from the solenoid valve/carburetor bowl vent to the vapor storage canister.

89. Connect the electrical connectors to the alternator. Connect the vacuum hose to the exhaust gas recirculation (EGR) valve and the electrical connectors for the engine coolant temperature sender and the water temperature sensor.

90. On the 2.8L engine, connect the electrical connector for the idle speed control (ISC) motor. Connect the accelerator and transmission kickdown cables to the throttle lever ball stud.

91. Position the A/C compressor in the engine brackets. Install the retaining bolts. On the 3.0L engine, connect the compressor suction and discharge hoses. Install the drive belt on the compressor clutch and idler pulley, if removed and adjust the drive belt tension. Connect the A/C compressor clutch electrical connector.

92. Connect the manifold absolute pressure (MAP) sensor electrical connector to the sensor on the dash panel.

93. Install the shroud over the fan and in position on the radiator, then install and tighten the retaining bolts. Connect the upper and lower radiator hoses.

94. Connect the ground cable to the battery and install the air cleaner and air intake duct assembly.

95. Refill the cooling system and check all fluid levels. Bleed the brakes and recharge the air conditioning system if the compressor hoses were disconnected during service.

96. Start the engine and check for leaks. The front end alignment should be checked and adjusted as soon as possible.

Bronco II

2.9L ENGINE

1. Disconnect the battery ground cable and drain the cooling system.

2. Remove the hood after scribing hinge positions. Remove the air cleaner and intake duct assembly.

3. Remove or disconnect thermactors system parts that will interfere with removal or installation of the engine.

4. Disconnect the radiator upper and lower hoses at the radiator. Remove the fan shroud attaching bolts and position the shroud over the fan. Remove the radiator and shroud.

5. Remove the alternator and bracket. Position the alternator out of the way. Disconnect the alternator ground wire from the cylinder block.

6. Remove A/C compressor (do not discharge the system) and power steering and position out of way, if so equipped.

7. Disconnect the heater hoses at the block and water pump.

8. Remove the ground wires from the cylinder block.

9. Relieve the fuel pressure. Disconnect the fuel tank to fuel pump fuel line at the fuel pump. Plug the fuel tank line.

10. Disconnect the throttle cable linkage at the throttle body and intake manifold.

11. Disconnect the primary wires from the ignition coil. Disconnect the brake booster vacuum hose. Disconnect the wiring from the oil pressure and engine coolant temperature senders.

12. Raise and support the vehicle safely. Disconnect the muffler inlet pipes at the exhaust manifolds.

13. Disconnect the starter cable and remove the starter.

14. Remove the engine front support to crossmember attaching nuts or through bolts.

15. If equipped with automatic transmission, remove the converter inspection cover and disconnect the flywheel from the converter.

16. Remove the kickdown rod. Remove the converter housing to cylinder block bolts and the adapter plate to converter housing bolt.

17. On vehicles equipped with a manual transmission, remove the clutch linkage. Lower the vehicle.

18. Attach engine lifting sling and hoist to lifting brackets at exhaust manifolds.

19. Position a jack under the transmission. Raise the engine slightly and carefully pull it from the transmission. Carefully lift the engine out of the engine compartment so that the rear cover plate is not bent or components damaged.

20. Reverse the procedure for installation. Refill the cooling system and check all fluid levels. Start the engine and check for leaks, road test the vehicle.

Ranger

2.0L AND 2.3L ENGINES

1. Raise the hood and install protective fender covers. Drain the coolant

from the radiator. Remove the air cleaner and duct assembly.

2. Disconnect the battery ground cable at the engine and disconnect the battery positive cable at the battery and set aside.

3. Mark the location of the hood hinges and remove the hood.

4. Disconnect the upper and lower radiator hoses from the engine. Remove the radiator shroud screws. Remove the radiator upper supports.

5. Remove engine fan and shroud assembly. Remove the radiator. Remove the oil fill cap.

6. Disconnect the coil primary wire at the coil. Disconnect the oil pressure and the water temperature sending unit wires from the sending units.

7. Disconnect the alternator wire from the alternator, the starter cable from the starter and the accelerator cable from the carburetor. If so equipped, disconnect the transmission kickdown rod.

8. If so equipped, remove the A/C compressor from the mounting bracket and position it out of the way, leaving the refrigerant lines attached.

9. Disconnect the power brake vacuum hose. Relieve the fuel pressure. Disconnect the chassis fuel line from the fuel pump. Disconnect the heater hoses from the engine.

10. Remove the engine mount nuts. Raise and safely support the vehicle.

11. Drain engine oil from the crankcase. Remove the starter motor.

12. Disconnect the muffler exhaust inlet pipe at the exhaust manifold.

13. Remove the dust cover (manual transmission) or converter inspection plate (automatic transmission).

14. On vehicles with a manual transmission, remove the flywheel housing cover lower attaching bolts. On vehicles with automatic transmissions, remove the converter-to-flywheel bolts, then remove the converter housing lower attaching bolts.

15. Remove clutch slave cylinder (manual transmission). Lower the vehicle.

16. Support the transmission and flywheel or converter housing with a jack.

17. Remove the flywheel housing or converter housing upper attaching bolts.

18. Attach the engine lifting hooks to the existing lifting brackets. Carefully, so as not to damage any components, lift the engine out of the vehicle.

19. Installation is the reverse of the removal procedure. Check and fill all fluid levels. Road test the vehicle for proper operation.

2.9L ENGINE

1. Disconnect the battery ground cable and drain the cooling system.

2. Remove the hood after scribing hinge positions. Remove the air cleaner and intake duct assembly.

3. Remove or disconnect thermactors system parts that will interfere with removal or installation of the engine.

4. Disconnect the radiator upper and lower hoses at the radiator. Remove the fan shroud attaching bolts and position the shroud over the fan. Remove the radiator and shroud.

5. Remove the alternator and bracket. Position the alternator out of the way. Disconnect the alternator ground wire from the cylinder block.

6. Remove A/C compressor (do not discharge the system) and power steering and position out of way, if so equipped.

7. Disconnect the heater hoses at the block and water pump.

8. Remove the ground wires from the cylinder block.

9. Relieve the fuel pressure. Disconnect the fuel tank to fuel pump fuel line at the fuel pump. Plug the fuel tank line.

10. Disconnect the throttle cable linkage at the throttle body and intake manifold.

11. Disconnect the primary wires from the ignition coil. Disconnect the brake booster vacuum hose. Disconnect the wiring from the oil pressure and engine coolant temperature senders.

12. Raise and support the vehicle safely. Disconnect the muffler inlet pipes at the exhaust manifolds.

13. Disconnect the starter cable and remove the starter.

14. Remove the engine front support to crossmember attaching nuts or through bolts.

15. If equipped with automatic transmission, remove the converter inspection cover and disconnect the flywheel from the converter.

16. Remove the kickdown rod. Remove the converter housing to cylinder block bolts and the adapter plate to converter housing bolt.

17. On vehicles equipped with a manual transmission, remove the clutch linkage. Lower the vehicle.

18. Attach engine lifting sling and hoist to lifting brackets at exhaust manifolds.

19. Position a jack under the transmission. Raise the engine slightly and carefully pull it from the transmission. Carefully lift the engine out of the engine compartment so that the rear cover plate is not bent or components damaged.

20. Reverse the procedure for installation. Check and fill all fluid levels. Road test the vehicle for proper operation.

Cylinder Head

REMOVAL & INSTALLATION

2.0L and 2.3L Engines

1. Drain the cooling system. Disconnect the negative battery cable.

2. Remove the air cleaner, spark plugs and dipstick tube assembly.

3. Remove the valve cover. On vehicles with air conditioning, remove the mounting bolts and the drive belt and position the compressor with the hoses attached, out of the way. Remove the compressor upper mounting bracket from the cylinder head. If the compressor refrigerant lines do not have enough slack to permit repositioning of the compressor without first disconnecting the refrigerant lines, the air conditioning system will have to be evacuated.

4. Raise and safely support the vehicle as necessary. Remove the intake and exhaust manifolds from the head.

5. Remove the camshaft drive belt cover. Note the location of the belt cover attaching screws that have rubber grommets if so equipped.

6. Loosen the timing belt tensioner and remove the belt.

7. Remove the water outlet elbow from the cylinder head with the hose attached.

8. Remove the cylinder head attaching bolts.

9. Remove the cylinder head from the engine.

10. Clean all gasket material and carbon from the top of the cylinder block

Cylinder head bolt torque sequence—2.0L and 2.3L engines

Cylinder head bolt torque sequence—2.8L engine

Cylinder head bolt torque sequence—2.9L engine

and pistons and from the bottom of the cylinder head.

11. Installation is the reverse of the removal procedure. Torque the cylinder head bolts in sequence in 2 steps. The 1st step in sequence to 50–60 ft. lbs. and the 2nd step in sequence to 80–90 ft. lbs.

2.8L and 2.9L Engines

1. Disconnect the battery ground cable.

2. Drain the radiator coolant.

3. Remove the air cleaner from the carburetor and disconnect the throttle linkage on the 2.8L engine. Remove the intake tube from the throttle body and disconnect the throttle linkage and cover on the 2.9L engine.

4. Mark and remove the distributor.

5. Remove the radiator hose and the bypass hose from the thermostat housing and intake manifold.

6. Remove the rocker arm covers and the rocker arm shafts (keep all parts in order for correct installation).

7. Remove the fuel line from carburetor and remove the carburetor on the 2.8L engine. Relieve the fuel system pressure. Remove the fuel line from the fuel rail on the 2.9L engine.

8. Remove the intake manifold assembly.

9. Remove and label the pushrods in order to keep them in sequence for proper assembly.

10. Raise and safely support the vehicle as necessary. Remove the exhaust manifolds.

11. Remove the cylinder head attaching bolts. Remove the cylinder heads and discard the head gaskets.

To install:

12. Clean the cylinder heads, intake manifold, valve rocker arm cover and cylinder block gasket surfaces.

13. Place the cylinder head gaskets in position on the cylinder block.

NOTE: Gaskets are marked with the words FRONT and TOP for correct positioning. Left and right cylinder head gaskets are not interchangeable. Use new cylinder head bolts.

14. Install the fabricated alignment dowels in the cylinder block and install the cylinder head assemblies on the cylinder block.

15. Remove the alignment dowels and install the cylinder head attaching bolts. Tighten the bolts to specification following the torque sequence.

16. Install the intake manifold assembly.

17. Install the exhaust manifold assemblies.

18. Install the pushrods. Install oil baffles and rocker arms in the correct order.

19. Install the distributor. Adjust the valves. Install the rocker arm covers.

20. Install the carburetor and connect the fuel line to the carburetor on the 2.8L engine. Connect the fuel line to the fuel rail on the 2.9L engine.

21. Install the distributor cap and spark plug wires. Install the throttle linkage and the air cleaner or air cleaner intake tube.

22. Fill the cooling system and bleed the cooling system. Connect the battery ground cable.

23. Start the engine and check for oil, fuel and coolant leaks. Check and adjust if necessary the ignition timing and idle speed. Road test the vehicle for proper operation.

3.0L Engine

1. Disconnect the negative battery cable.

2. Drain the cooling system.

3. Remove the air cleaner and the necessary duct work.

4. Remove the drive belt for the accessories as required.

5. To remove the left cylinder head, remove the power steering pump brackets from the cylinder head and set aside in a position to avoid fluid leakage. Remove and set aside the A/C compressor (do not remove the refrigerant lines).

6. To remove the right cylinder head, disconnect the thermactor diverter valve and hose at the bypass valve and downstream air tube. Remove the assembly. Remove the accessory drive idler. Remove the alternator. Remove the thermactor pump pulley. Remove the thermactor pump. Remove the alternator bracket. Remove the PCV valve.

7. Relieve the fuel pressure. Remove the intake manifold assembly.

8. Remove the rocker arm cover attaching screws and remove the valve covers.

9. Raise and safely support the vehicle as necessary. Remove the exhaust manifolds.

10. Loosen the rocker arm fulcrum attaching bolts enough to allow the rocker arms to be lifted off the pushrods and rotated to one side. Remove the pushrods, keeping them in order for correct installation.

11. Remove the cylinder head attaching bolts and carefully remove the cylinder head from the engine block.

12. To reassemble the cylinder heads to the engine block, reverse the removal procedures. Use new gaskets during the reassembly, along with new cylinder head bolts. Torque the cylinder head bolts in sequence to the proper specification.

Valve Lash

ADJUSTMENT

2.0L and 2.3L Engines

1. Remove the rocker arm cover. Position the camshaft so that the base circle of the lobe is facing the cam follower of the valve to be checked.

2. Using tool T74P-6565-A or equivalent, slowly apply pressure to the cam follower until the lash adjuster is completely collapsed. Hold the follower in this position and insert the proper size feeler gauge between the base circle of the cam and the follower.

3. The allowable collapsed tappet gap is 0.035–0.055 in. at the camshaft. The desired collapsed tappet gap is 0.040–0.050 in. at the camshaft. If the clearance is excessive, replace the necessary components.

Cylinder head bolt torque sequence—3.0L engine

2.8L Engine

1. With engine **COLD** and valve covers removed, place a finger on the adjusting screw of the intake valve rocker arm for cylinder No. 5.

2. Use a remote starter switch or equivalent to rotate (bump) the engine over until you can just feel the valve begin to open. The cam is now in position to adjust the intake and exhaust valves on the No. 1 cylinder.

3. Adjust the No. 1 intake valve so that a 0.014 in. feeler gauge has a slight drag, while a 0.015 in. feeler gauge is a tight fit. To decrease lash, turn the adjusting screw clockwise; to increase lash, turn the adjusting screw counterclockwise. There are no lockbolts to tighten as the adjusting screws are self-tightening.

NOTE: Do not use a step-type, "go-no-go" feeler gauge. When checking lash, you must insert the feeler gauge and move it parallel with the crankshaft. Do not move it in and out perpendicular with the crankshaft as this will give an erroneous feel which will result in overtightened valves.

4. Adjust the exhaust valve the same way so that an 0.016 in. feeler gauge has a slight drag, while a 0.017 in. gauge is a tight fit.

5. The rest of the valves are adjusted in the same way, in their firing order (1-4-2-5-3-6), by positioning the cam according to the valve adjusting chart.

2.9L Engine

1. Remove the valve cover assembly. On the cylinder to be adjusted, position the cams so that the tappets are on the base circle.

2. Loosen the adjusting screws until a lash between the roller arm pad and the valve tip end can be noticed.

3. Screw in the adjustment screws until the roller arms slightly touch the valves.

4. To achieve the nominal working position of the plunger, turn in the ad-

justing screw 1.5 turns, equivalent to 0.07 in. specification.

Rocker Arms/Shaft

REMOVAL & INSTALLATION

2.0L and 2.3L Engines

1. Disconnect the negative battery cable. Remove the valve cover and associated parts as required. On 2.3L engine relieve the fuel pressure. Remove the throttle linkage and throttle body assembly.

2. Rotate the camshaft so that the base circle of the cam is against the cam follower you intend to remove.

3. Remove the retaining spring from the cam follower, if so equipped.

4. Using special tool T74P-6565-B or a valve spring compressor tool, collapse the lash adjuster and/or depress the valve spring, as necessary and slide the cam follower over the lash adjuster and out from under the camshaft.

5. Install the cam follower in the reverse order of removal. Make sure that the lash adjuster is collapsed and released before rotating the cam shaft.

2.8L Engine

1. Disconnect the negative battery cable. Remove all necessary components to gain access to the rocker arm covers. Remove the rocker arm covers.

2. Remove rocker arm shaft stand retaining bolts by loosening the bolts 2 turns at a time, in sequence (center to end). Lift off rocker arm and shaft assembly and oil baffle.

To install:

3. Loosen the valve lash adjusting screws a few turns.

4. Apply engine oil to the assembly to provide initial lubrication.

5. Install oil baffle and rocker arm shaft assembly to the cylinder block and guide adjusting screws on to pushrods.

6. Install and tighten rocker arm stand attaching bolts to 43-50 ft. lbs. torque rocker arm stand attaching bolts 2 turns at a time in sequence-center to end.

7. Adjust valve lash to **COLD** specified setting.

8. Clean the valve rocker arm cover and cylinder head gasket surfaces. Install the valve cover, making sure the gasket seats evenly around the head. Tighten the cover attaching bolts.

9. Install all parts removed to gain access to rocker arm and shaft assemblies. Reconnect the battery ground cable. Run the engine and check for oil leaks.

2.9L Engine

1. Disconnect the negative battery cable. Mark and disconnect the spark plug wires.

2. Relieve the fuel pressure. Disconnect the fuel supply and return lines and position out of the way.

3. Remove the left hand lifting eye on vehicles equipped with A/C.

4. Remove the PCV valve hose and breather.

5. Remove the rocker arm attaching screws and the load distribution washers. Ensure the washers are installed in their original position.

6. Tap the rocker arm cover to break the seal and remove the covers.

7. Remove the rocker arm shaft stand attaching bolts by loosening the bolts 2 turns at a time, in sequence (center to end).

8. Lift off the rocker arm and shaft assembly and the oil baffle.

9. Reverse the removal procedure to install. Apply SF type engine oil to the assembly to provide initial lubrication. Torque the rocker arm shaft support bolt to 43-50 ft. lbs. in sequence (center to end). Adjust the valve lash.

3.0L Engine

1. Disconnect the negative battery cable. Disconnect the ignition wires from spark plugs (mark or label to ensure correct installation).

2. Remove the ignition wire separators from the the valve covers.

3. To remove the left side valve cover:

a. Relieve fuel pressure as necessary. Remove the throttle body assembly.

b. Remove the PCV valve.

4. To remove the right side valve cover:

a. Remove the oil filler tube assembly.

b. Disconnect closure system hose.

5. Remove the rocker cover bolts and remove the valve covers.

6. Remove the valve rocker arm bolt, fulcrum seat and rocker arm.

7. For installation, reverse the removal procedure. The fulcrums must be fully seated in cylinder heads and pushrods must be fully seated in rocker arm sockets prior to final torque. Install the fulcrum guide, valve rocker arm, fulcrum seat and bolt. Tighten to 18-26 ft. lbs. in 2 steps.

Intake Manifold

REMOVAL & INSTALLATION

2.0L Engine

1. Raise and safely support the ve-

VALVE ADJUSTMENT CHART—2.8L ENGINE

Intake manifold assembly—2.3L engine

Intake manifold bolt torque sequence—2.0L and 2.3L engines

Upper intake to lower intake manifold bolt torque sequence—2.3L engine

hicle as necessary. Drain the cooling system. Remove the air cleaner and duct assembly. Disconnect the negative battery cable.

2. Disconnect the accelerator cable, vacuum hoses (as required) and the water hose at the manifold fitting. Be sure to identify all vacuum hoses for proper reinstallation.

3. Remove the engine oil dipstick. Disconnect the heat tube at the EGR (exhaust gas recirculation) valve. Disconnect the fuel line at the carburetor fuel fitting.

4. Remove the dipstick retaining bolt from the intake manifold.

5. Disconnect and remove the PCV at the engine and intake manifold.

6. Remove the distributor cap and position the cap and wires out of the way, after removing the plastic plug connector from the valve cover.

7. Remove the intake manifold retaining bolts. Remove the manifold from the engine.

8. Clean all gasket mounting surfaces.

9. Install a new mounting gasket and intake manifold on the engine. Torque the bolts in proper sequence in steps to correct specification. The rest of the installation procedure is in the reverse order of removal.

2.3L Engine

1. Disconnect the negative battery cable and drain cooling system. Raise the vehicle and support as necessary.

2. Release the pressure from the fuel system.

3. Disconnect the electrical connectors at, throttle position sensor, engine coolant, ignition control assembly, EGR position sensor and air charge temperature sensor.

4. Disconnect the injector wiring harness at main engine harness and at water temperature indicator sensor.

5. Disconnect all vacuum lines to the upper intake, EGR valve and the fuel pressure regulator.

6. Remove protective shield. Disconnect the throttle linkage, cruise control and kickdown cable if equipped. Position accelerator cable and bracket out of way.

7. Disconnect air intake hose and crankcase vent hose. Remove the PCV system hose from the rear of the upper manifold. Remove water bypass line at lower intake manifold.

8. Disconnect the EGR tube from the valve by removing the flange nut.

9. Remove the upper intake manifold retaining bolts (note location of bolts for correct installation) and remove it and the throttle body as an assembly.

10. Remove the engine oil dipstick bracket retaining bolt. Remove all fuel line retaining clips and disconnect all fuel lines as required.

11. Disconnect the electrical connections from fuel injectors and position harness aside. Remove the fuel supply manifold retaining bolts. Remove fuel supply manifold and injectors.

12. Remove the upper and lower retaining bolts from lower manifold. Remove lower intake manifold assembly.

13. Installation is the reverse of the removal procedure. Torque (always torque retaining bolts in steps) lower manifold to cylinder head and upper intake manifold in sequence to 15–22 ft. lbs. Torque the fuel supply mani-

Intake manifold bolt torque sequence—2.8L engine

fold to 15–22 ft. lbs. Pressurize fuel system check for leaks. Check engine for correct idle.

2.8L Engine

1. Raise and safely support the vehicle as necessary. Drain the cooling system. Remove the air cleaner and duct assembly.

2. Disconnect the negative battery cable. Disconnect the accelerator cable from the carburetor linkage.

3. Disconnect and remove the upper radiator hose. Disconnect and remove the bypass hose from the intake manifold and thermostat housing.

4. Remove the distributor cap and spark plug wires as an assembly. Turn the engine till No. 1 piston is at TDC (top dead center) on the compression stroke. Mark and remove the distributor.

5. Remove the fuel line from the fuel filter. Remove carburetor and EGR spacer as required. Remove any vacuum lines and controls that will interfere with the intake manifold removal. Label all hoses for identification.

6. Remove both valve covers. Remove the manifold mounting (note location for correct installation) nuts and bolts. Remove the manifold.

To install:

7. Remove all old gasket material and sealing compound from the mounting surfaces.

8. Apply sealing compound to the joining surfaces. Place the intake manifold mounting gasket into position. Make sure that the tab on the right bank head gasket fits into the cutout of the manifold gasket. Apply sealing compound to the intake manifold bolt bosses and install the intake manifold. Tighten (always torque retaining bolts in steps) the mounting nuts and bolts in the proper torque sequence to correct specification.

9. Install the distributor and the rest of the removed components in reverse order. Reconnect the negative battery cable.

10. Refill the cooling system, start the engine and check for coolant or oil leaks.

11. Check idle rpm and ignition timing. Adjust if necessary.

2.9L Engine

1. Raise and safely support the vehicle as necessary. Disconnect battery negative cable.

2. Remove air cleaner air intake duct from throttle body.

3. Disconnect throttle cable and bracket assembly.

4. Disconnect EGR tube at EGR valve.

5. Disconnect all vacuum hoses from fittings on upper intake manifold.

6. Disconnect electrical connections at throttle body, EGR pressure sensor, intake manifold upper and lower and distributor. Also disconnect fuel injector sub harness from main EEC harness.

7. Remove upper intake manifold (plenum) assembly.

8. Drain coolant. Disconnect and remove hose from water outlet to radiator and heat supply.

9. Remove distributor cap and spark plug wires as an assembly.

10. Observe and mark the location of the distributor rotor and housing so ignition timing can be maintained as reassembly. Remove distributor hold down screw and clamp and lift out distributor.

11. Remove rocker arm covers.

12. Remove intake manifold attaching bolts and nuts. Note length of manifold attaching bolts during removal so that they may be installed in their original positions. Remove intake manifold.

13. Remove all old gasket material and sealing compound.

To install:

14. Apply sealing compound to the joining surfaces. Place the intake manifold gasket in position. Ensure the tab on the right hand bank cylinder head gasket fits into the cutout of the manifold gasket.

15. Apply sealing compound to the attaching bolt bosses on the intake manifold and position the intake manifold. Follow the tightening sequence and tighten the bolts to specifications in 4 equal steps. Always recheck torque after normal operating temperature is reached.

16. Install distributor so that rotor and housing are in the same position marked at removal.

17. Install distributor clamp and attaching bolts.

18. Replace rocker arm cover gasket and install rocker arm valve covers.

19. Install distributor cap and spark plug wires. Connect distributor wiring harness.

20. Apply sealing compound, joining surfaces of upper and lower intake manifold. Install upper intake manifold gaskets.

21. Install upper intake manifold (plenum) assembly and torque retaining bolts in sequence (center to end) to 15-18 ft. lbs. in steps.

22. Connect all vacuum hoses to fittings on upper intake manifold.

23. Connect electrical connections at throttle body, EGR pressure sensor, intake manifolds sub harness to EEC main harness.

24. Install and adjust throttle linkage bracket assembly and cover as required.

25. Connect hoses from water outlet to radiator and bypass hose from thermostat housing rear cover to intake manifold.

26. Connect battery negative cable. Refill and bleed the cooling system.

27. Recheck ignition timing and reset engine idle speed to specification. Start engine and check for coolant and oil leaks.

3.0L Engine

1. Raise and safely support the vehicle as necessary. Disconnect the negative battery cable.

2. Drain the engine cooling system.

3. Relieve the fuel pressure. Remove the throttle body. Disconnect the fuel lines.

4. Remove the fuel injector wiring harness from the engine.

5. Disconnect the upper radiator hose and the water outlet heater hose.

6. Mark and remove the distributor. Remove the rocker arm covers.

7. Remove the intake manifold attaching bolts and studs. The manifold can be removed with fuel rails and injectors in place.

8. Reverse the procedure for installation. Lightly oil all attaching bolts and stud threads before installation. Torque the intake manifold retaining bolts in the proper sequence to specification in steps.

Exhaust Manifold

REMOVAL & INSTALLATION

2.0L and 2.3L Engines

1. Disconnect the negative battery cable. Raise and safely support the vehicle as necessary. Remove the air cleaner and duct assembly.

Intake manifold bolt torque sequence—3.0L engine

Air intake manifold bolt torque sequence—3.0L engine

Exhaust manifold bolt torque sequence—2.0L and 2.3L engines

Intake manifold bolt torque sequence—2.9L engine

2. Remove the EGR line at the exhaust manifold. Loosen the EGR tube. Remove the check valve at the exhaust manifold and disconnect the hose at the end of the air bypass valve.

3. Remove the bracket attaching the heater hoses to the valve cover. Disconnect the exhaust pipe from the exhaust manifold.

4. Disconnect the EGO sensor. Remove the exhaust manifold mounting bolts/nuts. Remove the manifold.

5. Install the exhaust manifold in the reverse order. Torque bolts in sequence and to specification.

2.8L and 2.9L Engines

1. Disconnect the negative battery cable. Raise and safely support the vehicle as necessary. Remove the air cleaner and duct assembly.

2. Remove the left side heat shroud from the exhaust manifold. Remove any thermactor system parts that will interfere with manifold removal. Disconnect the choke heat tube at the carburetor on the 2.8L engine.

3. Disconnect the exhaust pipes from the exhaust manifolds. Remove the mounting nuts from exhaust manifold studs. Remove the exhaust manifolds.

4. Install in the reverse order using new exhaust pipe to manifold gaskets. Torque the retaining bolts to proper specification working from the center to the end of the manifold.

3.0L Engine

1. Disconnect the negative battery cable. Raise and support the vehicle as necessary. The following steps are for removal of the left side manifold.

a. Remove the dipstick tube support bracket.

b. Remove the power steering pump pressure and return hoses.

c. Remove the manifold to exhaust pipe attaching nuts.

d. Remove the exhaust manifold attaching bolts and remove the manifold.

2. The following steps are for removal of the right side manifold.

a. Remove the heater hose support bracket.

b. Disconnect the heater hoses.

c. Remove the manifold to exhaust pipe attaching nuts.

d. Remove the manifold attaching bolts and remove the manifold.

3. Install the manifolds in the reverse order of removal. Torque the retaining bolts to proper specification working from the center to the end of the manifold.

Timing Chain Front Cover

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Raise and safely support the vehicle as necessary. Drain the cooling system.

2. Drain engine oil. Remove the oil pan. Lower the vehicle. Remove all necessary hoses and vacuum lines. Remove the the shroud and radiator.

3. Remove the drive belt(s), power steering bracket and A/C compressor if so equipped, fan assembly.

4. Remove the water pump. Remove the drive pulley (and damper on 3.0L engine) from the crankshaft using a suitable tool.

5. Remove the front cover attaching bolts. Remove the front cover.

6. Installation is the reverse of the removal procedure. Tighten oil pan retaining bolts to 5-8 ft. lbs. and front cover retaining bolts 13-16 ft. lbs.

Front Cover Oil Seal

REMOVAL & INSTALLATION

2.8L and 2.9L Engines

NOTE: It is not necessary to remove the front cover for this service procedure.

1. Disconnect the negative battery cable. Raise and safely support the vehicle as necessary. Drain the coolant and remove the radiator.

2. Remove the crankshaft pulley and the water pump drive belt.

3. Remove the front cover oil seal with tool 1175-AC or equivalent and impact slide hammer T59L-100-B or equivalent.

4. Installation is the reverse of removal. Coat the new front seal with heavy SF engine oil before installing.

3.0L Engine

NOTE: It is not necessary to remove the front cover for this service procedure.

1. Disconnect the negative battery cable. Raise and safely support the vehicle as necessary. Remove drive belts.

2. Remove the crankshaft pulley.

3. Remove the damper bolt and washer. Remove the damper from the crankshaft using tool T58P-6316-D and T82L-6316-B or equivalent.

4. Pry the seal from the timing cover with a flat bladed tool. Use care to prevent damage to the front cover and the crankshaft.

5. Installation is the reverse of re-

moval. Lubricate the seal lip with clean engine oil before installing.

Timing Chain and Gears

REMOVAL & INSTALLATION

2.8L Engine

1. Crank the engine until the timing marks are in the correct (aligned) position. Disconnect the negative battery cable. Raise and safely support the vehicle as necessary.

2. Drain the cooling system and crankcase.

3. Remove the oil pan and radiator.

4. Remove the front cover assembly.

5. Remove the camshaft gear.

6. Install a gear puller or equivalent and remove the crankshaft gear.

7. Installation is the reverse of the removal procedure. Check camshaft for endplay. Make sure that timing marks are in the correct position upon installation. Torque the camshaft gear bolt to 30-36 ft. lbs. Torque camshaft thrust plate to 13-16 ft. lbs. Torque the crankshaft pulley retaining bolt to 85-96 ft. lbs. Replace the oil filter. Refill all fluid levels. Road test the vehicle for proper operation.

2.9L and 3.0L Engines

1. Crank the engine until the timing marks are in the correct (aligned) position. Disconnect the negative battery cable. Raise and safely support the vehicle as necessary.

2. Remove the crankshaft pulley, damper if so equipped and front cover assemblies.

3. Remove the camshaft sprocket attaching bolt and washer. Slide both

Timing marks-2.8L engine

Timing marks-2.9L and 3.0L engines

sprockets and timing chain forward and remove as assembly.

4. Installation is the reverse of the removal procedure. Torque the camshaft sprocket bolt to 19-28 ft. lbs. on the 2.9L engine and 46 ft. lbs. on the 3.0L engine. Torque the crankshaft pulley to 85-96 ft. lbs. on the 2.9L engine crankshaft damper bolt to 107 ft. lbs. on the 3.0L engine. Torque camshaft thrust plate to 13-16 ft. lbs. on the 2.9L engine and 7 ft. lbs. on the 3.0L engine.

5. Start the engine, check for leaks. Check and adjust ignition timing. Replace the oil filter. Refill all fluid levels. Road test the vehicle for proper operation.

Timing Belt Outer Cover

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Raise and safely support the vehicle as necessary.

2. Remove the fan assembly. Remove drive belts as required.

3. Drain cooling system and remove upper radiator hose. Remove thermostat housing and gasket.

4. Loosen and position power steering pump mounting bracket aside. Remove the timing belt outer cover retaining bolt. Release the 8 cover interlocking tabs. Remove the cover.

5. Installation is the reverse of the removal procedure.

OIL SEAL REPLACEMENT

The front oil seal has been designed so that it is not necessary to remove the front cover with the engine in the chassis. The front cover, camshaft and the auxiliary shaft seals are replaced

in the same manner with the same tools after the respective gear has been removed. To remove the cam and the auxiliary shaft sprockets, use tool T74P-6256-B or equivalent. To remove the crankshaft sprocket, use tool T74P-6306-A or equivalent. All of the seals are removed with tool T74P-6700-B or equivalent.

Timing Belt and Tensioner

ADJUSTMENT

1. Disconnect the negative battery cable. Remove the timing belt outer cover.

2. If the belt timing is incorrect, loosen the belt tensioner adjustment screw. Place camshaft belt tension adjusting tool T74P-6254-A or equivalent on the tension spring rollpin and retract the belt tensioner. Tighten the adjustment screw to hold the tensioner in the retracted position.

3. Remove the bolts holding the timing sensor if so equipped in place and pull the sensor assembly free of the dowel pin. Remove the crankshaft pulley/hub and belt guide.

4. Position the crankshaft sprocket to align with the TDC mark and the camshaft sprocket to align with the camshaft timing pointer.

5. Remove the distributor cap and set the distributor rotor to No. 1 firing position by turning the auxiliary shaft as required.

6. Install the timing belt over the crankshaft sprocket and then counterclockwise over the auxiliary and camshaft sprockets. Align belt over sprockets.

7. Loosen the tensioner adjustment bolt and allow the tensioner to move against the belt. Manually push the roller against the belt and tighten the

bolt as necessary. The spring cannot be used to set belt tension. A tool must be used on the tensioner assembly.

8. To ensure the belt does not jump time during rotation, remove the spark plugs. Rotate the crankshaft 2 complete turns in normal rotation to remove the slack from the belt. Tighten the tensioner adjustment bolt 14-21 ft. lbs. and pivot (spring) bolt to 28-40 ft. lbs. Check the alignment of the timing marks.

9. Install the crankshaft belt guide. Install the timing sensor if so equipped onto the dowel pin and tighten the 2 longer bolts.

10. To align the timing sensor if so equipped rotate the crankshaft 45 degrees (1/4 turn) counterclockwise and install the crankshaft pulley/hub assembly and bolt.

11. Rotate the crankshaft 90 degrees (1/2 turn) clockwise so that the vane of the crankshaft pulley engages with the timing sensor positioner. Tighten the 2 shorter sensor bolts.

12. Rotate the crankshaft 90 degrees (1/2 turn) counterclockwise and remove the timing sensor positioner.

13. Rotate the crankshaft 90 degrees (1/2 turn) clockwise and measure the outer vane to sensor air gap. The air gap must be 0.018-0.039 in.

Timing cover assembly-2.3L engine (1989)

Timing marks-2.0L and 2.3L engines

Timing belt assembly—2.3L engine

Crankshaft timing sensor—2.3L engine (1989)

14. Install the timing belt outer cover and the spark plugs. Reconnect the negative battery cable.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Raise and safely support the vehicle as necessary.
2. Drain the cooling system. Lower the vehicle. Remove the alternator assembly as required.
3. Disconnect the upper radiator hose. Remove the water pump pulley.
4. Remove the crankshaft pulley. Remove the timing belt outer cover assembly.

5. Loosen belt tensioner pulley assembly and remove the timing belt.

To install:

6. Install new timing belt. Release timing belt tensioner pulley.
7. Set camshaft/crankshaft (distributor rotor No. 1 firing position) timing and belt adjustment. Install timing belt outer cover and retaining bolt.
8. Install water pump pulley. Install crankshaft pulley.
9. Install alternator as necessary. Adjust drive belt.
10. Connect upper radiator hose and battery cable. Refill the cooling system. Start the engine and inspect for leaks. Check/adjust timing as required.

Timing Sprockets

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Raise and safely support the vehicle as necessary.
2. Remove timing belt cover. Remove timing belt assembly.
3. Remove timing sprockets retaining bolt(s). Remove timing sprocket as necessary with a suitable puller or equivalent.
4. Installation is the reverse of the remove procedure.

Camshaft

REMOVAL & INSTALLATION

2.0L and 2.3L Engines

NOTE: The following proce-

dure covers camshaft removal and installation with the cylinder head on or off the engine. If the cylinder head has been removed start at Step 9.

1. Drain the cooling system. Remove the air cleaner assembly and disconnect the negative battery cable. On 2.3L engine relieve the fuel pressure.
2. Remove the spark plug wires from the plugs, disconnect the retainer from the valve cover and position the wires out of the way. Disconnect vacuum lines as necessary.
3. Remove all drive belts. Remove the alternator mounting bracket-to-cylinder head mounting bolts, position bracket and alternator out of the way.
4. Disconnect and remove the upper radiator hose. Disconnect the radiator shroud.
5. Remove the fan blades and water pump pulley and fan shroud. Remove cam belt (timing belt) and valve cover.
6. Align engine timing marks at TDC. Remove cam drive (timing belt) belt.

7. Raise and support the vehicle safely as required. Remove the front motor mount bolts. Disconnect the lower radiator hose from the radiator. Disconnect and plug the automatic transmission cooler lines if so equipped.

8. Raise the engine carefully as far as it will go. Place blocks of wood between the engine mounts and cross-member pedestals.

9. Remove the rocker arms (camshaft followers).

10. Remove the camshaft drive gear guide using a suitable puller. Remove the front oil seal.

11. Remove the camshaft retainer located on the rear mounting stand by unbolting the 2 bolts.

12. Remove the camshaft by carefully withdrawing toward the front of the engine. Care should be used to prevent damage to cam bearings, lobes and journals.

13. Check the camshaft journals and lobes for wear. Inspect the cam bearings, replace as required. The cylinder head must be removed for new bearings to be installed.

14. Installation is in the reverse order of removal. Coat the camshaft with heavy SF oil before sliding it into the cylinder head. Install a new front seal. Set camshaft timing and belt adjustment. Adjust valve lash (collapsed tappet gap) as required.

2.8L and 2.9L Engines

1. Disconnect the negative battery cable from the battery. Relieve the fuel pressure on the 2.9L engine. Drain the coolant and remove the radiator, fan,

Auxiliary shaft assembly-2.0L and 2.3L engines

Camshaft thrust plate—2.9L engine

Camshaft assembly—2.3L engine

spacer, water pump pulley and the drive belt.

2. Remove the distributor cap with spark plug wires as an assembly. Remove the distributor vacuum line, distributor (mark for correct installation), alternator, thermactor, rocker arm covers, fuel line and filter, carburetor if so equipped, EGR tube and intake manifold. Remove the spark plug wire boots.

3. Remove the rocker arm and the shaft assemblies. Lift out the pushrods and mark so they can be reinstalled in the same location.

4. Raise and safely support the vehicle as necessary. Drain oil and remove the oil pan.

5. Remove the drive sprocket attaching bolt and slide the sprocket off the end of the shaft.

6. Remove the engine front cover and water pump as an assembly.

7. Remove the camshaft gear retaining bolt and slide the gear off the camshaft on 2.8L engines. Remove the camshaft gear and timing chain assembly on the 2.9L engine.

8. Remove the camshaft thrust plate and the screws.

9. Remove the valve lifters (lifters must be kept in order for correct installation).

10. Carefully remove the camshaft from the block, avoiding any damage to the camshaft bearings. Remove the camshaft gear key and spacer ring.

To install:

11. Oil the camshaft journals with gear oil or assembly lube and apply it to the cam lobes.

12. Install the camshaft in the block, carefully avoiding damage to the bearing surfaces.

13. Install the spacer ring with the chamfered side toward the camshaft. Insert the camshaft key and install the thrust plate so that it covers the main oil gallery. Torque the attaching screws to 13–16 ft. lbs.

14. Check the camshaft for the specified endplay.

15. Turn the camshaft and the crankshaft as necessary to align the timing marks and install the camshaft gear and timing chain assembly if so equipped. Install the camshaft retaining washer and bolt and tighten to 30–36 ft. lbs on the 2.8L engine and 19–28 ft. lbs. on the 2.9L engine.

16. Install the valve lifters to their original locations.

17. Install the engine front cover and water pump assemblies.

18. Install the belt drive pulley and secure with washer and retaining bolt. Tighten the bolt to specifications.

19. Install the oil pan.

20. Apply a light grease to both ends of the pushrods. Install the valve pushrods in their original locations. Continue the installation in the reverse order of the removal procedure. Reconnect the negative battery cable.

3.0L Engine

1. Drain the cooling system and relieve the fuel pressure.

2. Disconnect the negative battery cable. Raise and safely support the vehicle as necessary. Drain engine oil. Remove the engine (this is a factory recommended procedure) from the vehicle and position in a engine stand or equivalent.

3. Remove the throttle body and intake manifold. Remove the timing cover assembly.

4. Position the rocker arm fulcrum attaching bolts to one side. Remove the pushrods. Note location for correct installation.

5. Remove the valve lifters (must be installed in original location). If they are stuck in the bores from excessive varnish, use puller tool T70L-6500-A to remove them.

6. Check the camshaft endplay. If it is excessive, replace the thrust plate.

7. Remove the timing chain and the sprockets as an assembly.

8. Remove the camshaft thrust plate. Remove the camshaft by pulling it toward the front of the engine. Avoid damaging the bearings journals and the lobes.

9. Installation is the reverse of the removal procedure. Lubricate the camshaft journals and lobes and the valve lifters with heavy engine oil (SAE 50) before installation. Torque the thrust plate attaching bolts to 6–8 ft. lbs.

Piston and Connecting Rod POSITIONING

Piston installation—2.0L and 2.3L engines

Piston installation—2.8L engine, 2.9L engine similar

Piston installation—3.0L engine

DIESEL ENGINE MECHANICAL

Engine

REMOVAL & INSTALLATION

1. Mark the location of the hood hinges and remove the hood.
2. Disconnect the negative battery cables from both batteries and at the engine.
3. Drain the engine coolant.
4. Remove the crankcase breather hose at the rocker cover.
5. Remove the intake hose between the air cleaner and the turbocharger.
6. Remove the A/C compressor (do not discharge system) and position it out of the way.
7. Disconnect and plug the heater hoses from the heater core.
8. Remove the cooling fan. Disconnect the radiator hoses and remove the radiator.
9. Relieve the fuel pressure. Disconnect the electrical connector and the fuel supply line (plug line) at the fuel conditioner. Disconnect (cap) the fuel return line and the throttle cable at the injection pump.
10. Disconnect the vacuum lines at the pump fitting.
11. Disconnect the engine harness from the chassis harness at the alternator bracket.
12. Disconnect the wires from the glow plug bus bar.
13. Disconnect the starter motor wiring and remove the starter.
14. Raise the vehicle and support it safely. Remove the right side wheel and the right side inner fender.
15. Disconnect the oil pressure switch wire.
16. Disconnect the oil filter lines at the oil filter adapter.
17. Remove the nuts attaching the engine mounts to the brackets.
18. Disconnect the muffler inlet pipe from the exhaust outlet pipe (turbocharger assembly).
19. Disconnect the power steering pump hoses at the pump.
20. Disconnect the clutch servo hydraulic line at the clutch housing and position it out of the way.
21. Remove the transmission attaching bolts, except the top 2 retaining bolts.
22. Lower the vehicle. Attach an engine lifting hoist to the lifting brackets.
23. Remove the top 2 transmission bolts and remove the engine from the vehicle.

24. Installation is the reverse of the removal procedure. Connect battery ground cables at both batteries. Check all fluid levels and fill as required. Run engine and check for fuel, oil and coolant leaks. Road test the vehicle for proper operation.

Cylinder Head

REMOVAL & INSTALLATION

1. Disconnect battery ground cables from both batteries.
2. Mark location of hood hinges and remove hood.
3. Drain cooling system.
4. Disconnect breather hose from rocker cover.
5. Remove heater hose clamp from rocker cover and position hoses out of the way.
6. Remove cooling fan and shroud.
7. Remove accessory drive belts.
8. Remove upper front timing belt cover.
9. Loosen and remove camshaft/injection pump timing belt from camshaft sprocket.
10. Remove inlet hose between air cleaner and the turbocharger inlet.
11. Raise and safely support the vehicle. Disconnect muffler inlet pipe from turbocharger assembly exhaust fitting. Lower vehicle.
12. Remove fuel conditioner and bracket and position assembly out of the way.
13. Disconnect and remove fuel lines between injection pump and nozzles. Cap all lines and fittings using protective cap set T85L-9395-A or equivalent.
14. Disconnect heater hose from fitting on left hand rear of cylinder head.
15. Remove A/C compressor and mounting bracket.
16. Disconnect glow plug electrical leads from No. 2 and No. 3 glow plugs.
17. Disconnect coolant temperature switch wire.

Cylinder head bolt removal sequence—2.3L diesel engine

Cylinder head bolt installation sequence—2.3L diesel engine

18. Remove intake and exhaust manifold.
19. Remove rocker cover.
20. Remove cylinder head retaining bolts in correct sequence.
21. Remove cylinder head. Remove old head gasket.
22. Remove components as necessary.

To install:

23. Assemble components to head as necessary.
24. Clean gasket mating surfaces on cylinder head and engine block.
25. Position new cylinder head gasket on engine block.
26. Position cylinder head on engine block and install cylinder head bolts. Tighten bolts in sequence shown, as follows:
 - a. Tighten bolts in sequence to 38-42 ft. lbs.
 - b. Tighten bolts in sequence to 76-83 ft. lbs.
27. Install rocker cover. Ensure half moon gasket is installed in rear of cylinder.
28. Install intake and exhaust manifolds.
29. Connect coolant temperature switch connector.
30. Connect glow plug connectors to No. 3 and No. 4 glow plugs.
31. Install A/C compressor bracket and A/C compressor.
32. Connect heater hose to fitting on left hand rear of cylinder head.
33. Connect fuel lines to injection pump and nozzles.
34. Install fuel conditioner and bracket.
35. Raise vehicle and connect muffler inlet pipe to turbocharger assembly exhaust fitting. Lower vehicle.
36. Connect inlet hose between air cleaner and turbocharger inlet.
37. Install and adjust injection pump/camshaft timing belt.
38. Install upper timing belt cover. Install accessory drive belts.
39. Install heater hoses on rocker cover and install clamp.
40. Connect breather hose to rocker cover. Change engine oil and filter. Fill engine with specified quantity and quality of oil.
41. Fill and bleed cooling system. Connect battery ground cables to both batteries.
42. Run engine and check for oil, fuel and coolant leaks. Install hood.

Valve Lash

ADJUSTMENT

1. Warm engine to normal operating condition. Remove rocker cover.
2. Rotate the engine until No. 1 piston is at TDC of compression stroke.

Valve clearance adjustment

Check or adjust valve clearance of valves labeled A.

3. Rotate the engine (360 degrees) until No. 4 piston is at TDC of compression stroke. Check or adjust valve clearance of valves labeled B.

4. If valve clearance is not within specifications. Valve clearance on a hot engine is 0.010 in. for intake and exhaust valves. Loosen adjusting screw locknut. Rotate the adjust screw to the proper clearance. Hold adjusting screw and tighten locknut to 9-13 ft. lbs.

5. Install rocker cover.

Rocker Arms/Shaft

REMOVAL & INSTALLATION

1. Disconnect ground cables from both batteries. Remove the valve cover.

2. Remove the bolts attaching the rocker shaft to the cylinder head, 1 turn at a time from the front to the rear and remove the rocker shaft.

To install:

3. Position the rocker shaft on the cylinder head. Be certain the end of the rocker shaft with the single oil hole is toward the front of the engine. Also, ensure the rocker shaft is installed with the oil holes down.

4. Install the rocker shaft retaining bolts and tighten one turn at a time from front to rear, repeating the sequence until all the bolts are seated. Tighten the bolts to 25-28 ft. lbs.

5. Adjust valve rocker arms. Install the valve cover.

6. Reconnect the ground cables. Run the engine and check for oil leaks.

Intake Manifold

REMOVAL & INSTALLATION

1. Disconnect ground cables from both batteries.

2. Remove support braces from A/C compressor bracket, inlet fitting and intake manifold.

3. Remove A/C compressor from mounting bracket and position out of the way.

4. Remove inlet fitting from intake manifold.

5. Remove turbocharger oil feed line from cylinder head and turbocharger center housing. Remove oil line clamp bolt.

6. Loosen bolts attaching turbocharger heat shield to exhaust manifold. Remove top bolt and position shield out of the way.

7. Remove wastegate actuator from turbocharger and mounting bracket.

8. Remove 2 top actuator mounting bracket bolts. Loosen bottom bracket bolts and position bracket out of the way.

9. Remove remaining intake manifold bolts and nuts and remove intake manifold.

10. Installation is the reverse of the removal procedure. Torque all retaining bolts and nuts to specification in steps. Run engine and check for oil and intake air leaks. Road test the vehicle for proper operation.

Exhaust Manifold

REMOVAL & INSTALLATION

1. Disconnect battery ground cable from both batteries.

2. Remove support brackets from A/C compressor bracket, inlet fitting and intake manifold.

3. Remove A/C compressor from mounting bracket and position out of the way.

4. Remove inlet fitting from intake manifold. Remove air inlet tube from air cleaner-to-turbocharger inlet.

5. Remove wastegate actuator from turbocharger and mounting bracket.

6. Raise and safely support vehicle. Disconnect muffler inlet pipe from turbocharger exhaust fitting. Lower vehicle.

7. Disconnect turbocharger oil feed line from cylinder head and turbocharger center housing.

8. Remove nuts attaching exhaust manifold to cylinder head and remove exhaust manifold and turbocharger as an assembly.

9. Remove turbocharger from exhaust manifold if necessary.

10. Installation is the reverse of the removal procedure. Torque all retaining bolts to specification working from the center to end in steps. Connect battery ground cables to both batteries. Run engine and check for oil and exhaust leaks.

Turbocharger

REMOVAL & INSTALLATION

1. Disconnect battery ground cable from both batteries.

Turbocharger assembly

2. Raise and safely support the vehicle as necessary.

3. Remove exhaust manifold assembly.

4. Remove the turbocharger mounting bolts. Remove the turbocharger assembly.

5. Installation is the reverse of the removal procedure. Connect battery ground cables to both batteries. Run engine and check for oil and exhaust leaks.

Timing Belt Upper Front Cover

REMOVAL & INSTALLATION

1. Disconnect the negative battery cables. Raise and safely support the vehicle as necessary.

2. Remove drive belts as required.

3. Remove the 5 cover attaching bolts. Remove the upper front cover.

4. Installation is the reverse of the removal procedure.

Timing Belt Lower Front Cover

REMOVAL & INSTALLATION

1. Disconnect the negative battery cables. Raise and safely support the vehicle as necessary.

2. Remove the cooling fan and shroud assembly. Remove drive belts as required.

3. Remove water pump pulley retaining bolts. Remove water pump pulley.

4. Remove the crankshaft pulley.

5. Remove the 5 cover attaching bolts. Remove the lower front cover.

Timing belt lower cover

Timing marks belt adjustment—2.3L diesel engine

Timing belt adjustment—2.3L diesel engine

6. Installation is the reverse of the removal procedure.

OIL SEAL REPLACEMENT

1. Disconnect the negative battery cable. Raise and safely support the vehicle as necessary.
2. Remove the cooling fan and shroud assembly. Remove drive belts.
3. Remove the crankshaft pulley, upper and lower timing belt covers and timing belt.
4. Remove the crankshaft sprockets and timing plate.

Silent shaft belt adjustment

5. Using a suitable tool remove the seal from engine assembly.

6. Installation is the reverse of the removal procedure. Torque the crankshaft pulley bolt to 123–137 ft. lbs.

Timing Belt and Tensioner

ADJUSTMENT

Injection Pump/Camshaft

1. Remove timing belt upper cover.
2. Rotate engine until No. 1 piston is at TDC on compression stroke.
3. Ensure crankshaft pulley, injection pump sprocket and camshaft sprocket are aligned with their timing marks.
4. Loosen top belt tensioner bolt 1 or 2 turns and loosen bottom bolt one complete turn. This allows tensioner spring to automatically adjust belt tension.
5. Rotate crankshaft clockwise to that alignment pointer on timing cover aligns with second tooth from alignment mark on camshaft sprocket.

NOTE: Rotate crankshaft smoothly by 2 camshaft sprocket teeth. Failure to do so will result in an incorrect belt tension and possible engine damage.

6. Tighten top belt tensioner mounting bolt to 16–21 ft. lbs., then tighten bottom bolt to 16–21 ft. lbs. Always tighten the top bolt first. Tighten bottom bolt first can cause tensioner to rotate and over-tension the timing belt.

7. Rotate crankshaft counterclockwise until timing marks are aligned. Push belt down halfway between injection pump sprocket and camshaft sprocket and check deflection. If properly tensioned, belt should deflect 0.16–0.20 in.

Silent Shaft

1. Rotate crankshaft until No. 1 piston is at TDC on compression stroke.
2. Remove access cover for top belt tensioner bolt by inserting a suitable tool in slot and prying out.
3. Loosen top belt tension mounting bolt 1 complete turn. Then, loosen bottom bolt 1 to 2 turns. This allows tensioner spring to automatically adjust belt tension.
4. Tighten bottom tensioner bolt to 16–21 ft. lbs., then tighten top bolt to 15–19 ft. lbs. Always tighten bottom bolt first. Tighten top bolt first can cause tensioner to rotate and over-tension the timing belt.
5. Install access cover for top tensioner bolt by sliding down along 2 guide lines embossed on front lower cover.

REMOVAL & INSTALLATION

1. Disconnect battery ground cables from both batteries.
 2. Remove cooling fan and fan shroud.
 3. Remove accessory drive belts.
 4. Rotate crankshaft in direction of engine rotation to bring No. 1 piston to TDC of compression stroke.
 5. Remove crankshaft pulley.
 6. Remove upper and lower front covers.
 7. Loosen belt tensioners from timing belts. Remove belt(s), as necessary.
- To install:**
8. Align crankshaft timing marks.
 9. Align left hand and right hand silent shaft timing marks.
 10. Install silent shaft belt.

NOTE: Install belt in original direction of rotation. For ease of installation, pry on tensioner spring to reduce load on tensioner.

11. Align camshaft timing marks.
12. Install injection pump/camshaft timing belt as follows.

NOTE: To ease installation, locally manufacture the following tool. Using a pivot nut from a rear brake shoe adjuster, weld a piece of bar stock on the end.

- a. Using the tensioner spring tool or equivalent, release the tension on the tension spring for the injection pump/camshaft timing belt.
- b. After releasing spring tension, rotate tensioner toward water pump and tighten top bolt.
- c. Install the belt (original direction of rotation).
- d. Maintain tension on the belt to prevent the belt from slipping. After the belt is positioned, loosen the top tensioner bolt to tension the belt.

Timing marks for belt installation—2.3L diesel engine

Timing belt installation—2.3L diesel engine

13. Adjust silent shaft belt and camshaft/injection pump belt tensions.
14. Install upper and lower front timing covers.
15. Install crankshaft pulley.
16. Install accessory drive belts.
17. Install cooling fan and fan shroud.
18. Connect battery ground cables to both batteries.

Timing Sprockets

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Raise and safely support the vehicle as necessary.
2. Remove timing belt covers. Remove timing belt(s).
3. Remove timing sprockets retaining bolt(s). Remove timing sprocket as necessary with a suitable puller or equivalent.

Camshaft assembly—2.3L diesel engine

4. Installation is the reverse of the remove procedure.

Camshaft

REMOVAL & INSTALLATION

1. Disconnect battery ground cables from both batteries.
2. Remove rocker cover.
3. Remove upper front timing cover.
4. Rotate crankshaft until No. 1 piston is at TDC on compression stroke.
5. Loosen camshaft/injection pump drive belt tensioner and remove timing belt from camshaft pulley.
6. Remove camshaft pulley bolt and remove pulley.
7. Remove rocker arm shaft.
8. Remove camshaft bearing caps (note location for correct installation) and remove camshaft.
9. Remove and discard camshaft oil seal.
10. Inspect camshaft and bearings.

To install:

11. Position camshaft on cylinder head and install bearing caps. Tighten bolts to 14–15 ft. lbs. Ensure bearing caps are installed in their original positions.
12. Coat sealing lip of new camshaft seal with engine oil and install seal using suitable tool. Ensure seal installer is positioned with hole over spring pin on camshaft.
13. Install rocker arm.
14. Install camshaft pulley.
15. Install camshaft/injection pump drive belt. Adjust drive belt.
16. Adjust valves. Install upper front timing cover and rocker cover.
17. Fill cooling system. Connect bat-

tery ground cable to both batteries. Run engine and check for oil leaks.

Auxiliary Shafts

REMOVAL & INSTALLATION

Right Hand Silent Shaft Assembly

1. Disconnect battery ground cables from both batteries.
2. Remove cooling fan and fan shroud.
3. Remove water pump pulley, crankshaft pulley, upper and lower timing belt covers, timing belts and crankshaft sprockets.
4. Raise and safely support the vehicle as necessary. Drain the engine oil and remove oil pan.
5. Remove pipe plug in right hand side of engine block. Insert cross point tool into hole to prevent right hand silent shaft from rotating. Remove nut attaching silent shaft sprocket to drive gear and remove sprocket.
6. Remove bolts attaching front case to engine block (note location of bolts for correct installation).
7. Remove front case and gasket.
8. Remove silent shaft reverse rotation gear cover and remove silent shaft and gears.
9. Remove oil pump cover and remove oil pump drive gear and inner/outer gears (mark oil pump gears for correct installation).
10. Remove silent shaft reverse rotation drive gear oil seal using seal remover tool T58L-101-B or equivalent.
11. Remove crankshaft front oil seal.

To install:

12. Install silent shaft oil seal using a 21mm socket or equivalent.
13. Install silent shaft reverse rotation gears with marks aligned.
14. Install oil pump gears in front housing.

NOTE: Align marks on oil pump gears when installing.

15. Install oil pump gear cover.
16. Install silent shaft in reverse rotation drive gear. Position front cover and new gasket on engine block using care not to damage silent shaft bearing. Install bolts and tighten to 9–10 ft. lbs.
17. Install silent shaft sprocket. Insert suitable tool in hole in block to prevent silent shaft from rotating. Tighten sprocket nut to 25–28 ft. lbs.
18. Remove tool and install pipe plug.

NOTE: When installing silent shaft sprocket, ensure D flat on sprocket is aligned with D flat on shaft.

Right hand silent shaft assembly

Right hand silent shaft removal

Silent shaft sprocket installation

23. Install and adjust timing belts.
24. Install upper and lower timing belt covers.
25. Install crankshaft and water pump pulleys.
26. Install accessory drive belts, cooling fan and fan shroud.
27. Connect battery ground cables to both batteries. Run and check for oil leaks. Road test the vehicle for proper operation.

Right hand silent shaft installation

Left hand silent shaft assembly

Left Hand Silent Shaft Assembly

1. Disconnect battery ground cables from both batteries.
2. Remove cooling fan and fan shroud.
3. Raise and safely support the vehicle as necessary. Remove accessory drive belts.
4. Remove alternator and bracket.
5. Remove water pump and crankshaft pulleys.
6. Remove upper and lower timing belt covers, timing belts and injection pump.
7. Remove access plate on left hand side of engine and insert a socket extension tool or equivalent in hole to prevent left hand silent shaft from rotating.
8. Remove bolt attaching sprocket to silent shaft and remove sprocket.
9. Remove bolts attaching front case to engine block and remove case.
10. Remove silent shaft.
11. Remove silent shaft seal using

19. Install crankshaft front oil seal.
20. Install crankshaft sprocket.
21. Apply a bead of silicone sealant or equivalent along split lines between lower front case cover and rear oil seal retainer and engine block.

22. Install oil pan and retaining bolts tighten to 5-7 ft. lbs.

seal remover tool-1175-AC or equivalent.

To install:

12. Install a new silent shaft seal using an appropriate size socket or equivalent.

13. Install silent shaft.

14. Install front cover and new gasket on engine block. Note front cover bolts are different lengths.

15. Insert socket extension or equivalent in access hole in left hand side of engine.

16. Install silent shaft sprocket on silent shaft and tighten bolt to 25-28 ft. lbs. When installing silent shaft sprocket, ensure D flat on sprocket is aligned with D flat on shaft.

17. Remove extension from access hole and install cover.

18. Install crankshaft sprockets.

19. Install injection pump and sprocket.

20. Install and adjust timing belts.

21. Install upper and lower timing belt covers, water pump pulley and crankshaft pulley.

22. Install accessory drive belts.

23. Install cooling fan and shroud.

24. Connect battery ground cables to both batteries. Run engine and check for oil leaks. Road test the vehicle for proper operation.

Piston and Connecting Rod

POSITIONING

Piston installation-2.3L Diesel engine

Left hand silent shaft removal

ENGINE LUBRICATION

Oil Pan

REMOVAL & INSTALLATION

2.0L and 2.3L Engines

NOTE: Vehicles equipped with automatic transmission remove oil pan out the front of the engine compartment. Vehicles equipped with manual transmissions remove the oil pan out the rear of the engine compartment.

1. Disconnect the negative battery cable.

2. Remove air cleaner assembly on 2.0L engine. Remove air cleaner outlet tube at throttle body on 2.3L engine. Remove oil dipstick. Remove engine mount retaining nuts.

3. Remove oil cooler lines at the radiator, if so equipped. Remove bolts retaining the fan shroud to the radiator and remove shroud.

4. Remove radiator retaining bolts (automatic transmission). Position radiator upward and wire to the hood (automatic transmission).

5. Raise and safely support the vehicle.

6. Drain oil from crankcase.

7. Remove starter cable from starter and remove starter.

8. Disconnect the exhaust manifold tube to the inlet pipe bracket at the thermactor check valve. Disconnect the catalytic converter at the inlet pipe.

9. Remove transmission mount retaining nuts to the crossmember.

10. Remove bellcrank from converter housing (automatic transmission).

11. Remove oil cooler lines from retainer at the block (automatic transmission).

12. On 2WD vehicles remove front crossmember and on 4WD vehicles stabilizer bar assembly (automatic transmission).

13. Disconnect right front lower shock absorber mount (manual transmission).

14. Position jack under engine, raise and block with a piece of wood or equivalent. Remove jack.

15. Position jack under the transmission and raise slightly (automatic transmission).

16. Remove oil pan retaining bolts, lower pan to the chassis. Remove the low oil sensor assembly if so equipped. Remove oil pump drive and pick up tube assembly.

17. Remove oil pan (out the front for automatic transmission) (out the rear for manual transmission).

18. Installation is the reverse of the removal procedure. Torque the oil pan retaining bolts in steps to 7-10 ft. lbs.

2.3L Turbocharged Diesel Engine

1. Disconnect battery ground cable from both batteries.

2. Remove engine oil dipstick.

3. Remove cooling fan and fan shroud.

4. Drain cooling system and remove radiator.

5. Remove alternator belt.

6. Remove bolts securing A/C condenser to radiator support and position condenser up and out of the way.

7. Raise and safely support the vehicle.

8. Disconnect oil level switch wire.

9. Drain engine oil.

10. Remove oil filter.

11. Remove bolts securing stabilizer bar brackets to frame and lower stabilizer bar.

12. Disconnect power steering lines from power steering pump.

13. Remove clamp securing power steering line to crossmember; position line out of the way.

14. Remove nuts securing motor mounts to support brackets.

15. Position a jack under transmission housing and raise engine until it contacts dash panel. Install wooden wedges between motor mounts and crossmembers.

16. Remove oil pan bolts and let pan rest on crossmember.

17. Remove 2 bolts and 1 nut securing pickup tube to engine and lower pickup into oil pan.

18. Rotate crankshaft until crankshaft main bearing throws are parallel to bottom of engine to provide clearance to remove oil pan.

19. Remove oil pan through the front by first raising it up between the engine and radiator support. Then bring it out through the bottom.

20. Installation is the reverse of the removal procedure. Torque the retaining bolts to 5-7 ft. lbs. Connect battery

ground cables to both batteries. Run engine and check for fluid leaks.

2.8L and 2.9L Engines

1. Disconnect negative battery cable. Remove carburetor air cleaner assembly on 2.8L engine. Remove air intake tube on the 2.9L engine.

2. Remove fan shroud and position over fan.

3. Remove distributor cap, position forward of dash panel. Remove distributor and cover bore opening.

4. Remove nuts attaching engine front insulators to cross member. Remove engine oil dipstick tube.

5. Raise and safely support the vehicle.

6. Drain engine crankcase. Remove transmission fluid filler tube and plug pan hole (auto transmission).

7. Remove engine oil filter. Disconnect muffler inlet pipe(s), except on 2WD vehicles.

8. Disconnect oil cooler bracket and lower (if so equipped). Remove starter motor.

9. Position out of way, transmission oil cooler lines (if so equipped). Disconnect front stabilizer bar and position forward.

10. Position jack under engine and raise engine and install wooden blocks or equivalent between front insulator mounts and No. 2 crossmember.

11. Lower engine onto blocks and remove jack.

12. Remove oil pan attaching bolts. Lower oil pan assembly.

13. On 4WD vehicles remove oil pump and pickup tube assembly (attached to bearing cap) and lower into oil pan. Remove oil pan assembly.

14. On 2WD vehicles remove oil pan assembly.

15. Installation is the reverse of the removal procedure. Torque the oil pan retaining bolts in steps to 4-6 ft. lbs. The oil pan torque sequence is rear of engine to front inline.

3.0L Engine

1. Disconnect the negative battery cable.

2. Remove the oil level dipstick. Raise the vehicle and support it safely.

3. If equipped with an oil level sensor, remove the retaining clip at the sensor. Remove the electrical connector from the sensor.

4. Drain the crankcase. Remove the starter motor.

5. On 1986-88 vehicles remove the flywheel dust cover from the converter housing. Loosen the transmission bolts and slide the transmission 1/4 in. rearward.

6. Remove the oil pan attaching bolts and remove the pan.

7. Installation is the reverse of removal. Torque the oil pan retaining bolts in steps to 6-8 ft. lbs.

Oil Pump

REMOVAL & INSTALLATION

2.3L, 2.8L, 2.9L and 3.0L Engines

1. Disconnect the negative battery cable. Raise and safely support the vehicle as necessary. Drain engine oil. Remove the oil pan.

2. Remove the oil pump inlet tube and screen assembly if necessary.

3. Remove the oil pump attaching bolts and remove the oil pump gasket and intermediate driveshaft.

To install:

4. Prime oil pump by filling the inlet and outlet port with clean engine oil and rotating the shaft of the pump to distribute it.

5. Position the intermediate driveshaft into the distributor socket.

6. Position the new gasket on the pump body and insert the intermediate driveshaft into the pump body.

7. Install the pump and intermediate driveshaft as an assembly. Do not force the pump if it does not seat readily. The driveshaft may be misaligned with the distributor shaft. To align it, rotate the intermediate driveshaft into a new position.

8. Install the oil pump attaching bolts. Install the oil pan. Reconnect the negative battery cable.

2.3L Turbocharged Diesel Engine

1. Disconnect battery ground cables from both batteries.

2. Remove cooling fan and fan shroud.

3. Remove water pump pulley, crankshaft pulley, upper and lower timing belt covers, timing belts and crankshaft sprockets.

4. Raise and safely support the vehicle. Drain engine oil. Remove the oil pan.

5. Remove pipe plug in right hand side of engine block. Insert cross point tool into hole to prevent right hand silent shaft from rotating. Remove nut attaching silent shaft sprocket to drive gear and remove sprocket.

6. Remove bolts attaching front case to engine block and remove front case.

7. Remove front case and gasket.

8. Remove silent shaft reverse rotation gear cover and remove silent shaft and gears.

NOTE: Make alignment marks

on oil pump components before removal for correct installation.

9. Remove oil pump cover and remove oil pump drive gear and inner and outer gears.

10. Installation is the reverse of the removal procedure. Connect battery ground cables to both batteries. Run again and check for oil leaks.

Checking

Thoroughly clean all parts in solvent and dry with compressed air. Check the inside of the pump housing for obvious wear or scoring.

Measure the inner rotor tip clearance. With the rotor assembly installed in the housing, place a straightedge over the rotor assembly and the housing. Measure the clearance (rotor endplay) between the straightedge and both the inner rotor and outer race. Measure the driveshaft to housing clearance by comparing shaft outer diameter to housing bearing inner diameter. Inspect relief valve spring for collapsed or worn condition. Check the spring tension. Check relief valve piston and bore for scores and free operation.

The inner to outer rotor tip clearance is 0.012 in. maximum (feeler gauge inserted 1/2 in.) and rotor assembly endplay clearance is 0.005 maximum. If any part of the oil pump requires replacement, replace the complete pump assembly.

Measure rotor endplay

Measure inner rotor tip clearance

Rear Main Bearing Oil Seal

REMOVAL & INSTALLATION

One Piece Seal

1. Disconnect the negative battery cable. Raise and safely support the vehicle and remove the starter. Remove the transmission and on manual transmission equipped vehicles remove the clutch assembly.

2. Remove the flywheel. Lower the oil pan if necessary for working room.

3. Use an awl or equivalent to punch two small holes on opposite sides of the seal just above the split between the main bearing cap and engine block. Install a sheet metal screw in each hole. Use 2 small pry bars and pry evenly on both screws using two small blocks of wood as a fulcrum point for the pry bars. Use caution throughout to avoid scratching or damage to the oil seal mounting surfaces.

4. When the seal has been removed, clean the mounting recess.

5. Coat the seal and block mounting surfaces with oil. Apply white lube to the contact surface of the seal and crankshaft. Start the seal into the mounting recess and install with seal mounting tool.

6. Install the remaining components in the reverse order of removal.

MANUAL TRANSMISSION

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

5 speed manual transmission—Bronco II and Ranger

Transmission Assembly

REMOVAL & INSTALLATION

1. Place the gearshift lever in neutral. Remove the boot retainer screws. Remove the bolts attaching the retainer (some vehicles have 1 shifter retaining bolt) cover to the gearshift lever retainer. Disconnect the clutch master cylinder pushrod from the clutch pedal.

2. Pull the gearshift lever assembly, shim and bushing straight up and away from the gearshift lever retainer. Cover the shift tower opening in the extension housing with a cloth.

5 speed manual transmission—Aerostar

4WD SAME AS 2WD EXCEPT AS SHOWN

M50D manual transmission

3. Disconnect the clutch hydraulic system master cylinder pushrod from the clutch pedal.

4. Disconnect the negative battery cable from the battery terminal.

5. Raise and safely support the vehicle. Mark and disconnect the driveshaft at the rear. Pull the driveshaft rearward and disconnect from the transmission. Install a suitable plug in the extension housing to prevent lubricant leakage.

6. Remove the clutch housing dust shield and slave cylinder hydraulic line and secure it at one side.

7. Remove the speedometer cable from the extension housing.

8. Disconnect the starter motor and back-up lamp switch wires.

9. Place a jack under the engine, protecting the oil pan with a wood block or equivalent.

NOTE: If vehicle is 4WD, remove the transfer case at this point of the service procedure.

10. Remove the starter motor. Position a suitable jack under the transmission.

11. Remove the bolts (note location of bolts for correct installation), lock-washers and flat washers attaching the transmission to the engine rear plate.

12. Remove the nuts and bolts attaching the transmission mount and damper to the crossmember.

13. Remove the nuts attaching the crossmember to the frame side rails and remove the crossmember.

14. Lower the engine jack. Work the clutch housing off the locating dowels and slide the transmission rearward until the input shaft spline clears the clutch disc. Remove the transmission from the vehicle.

15. Installation is the reverse of removal procedure. Always torque all retaining bolts in progressive steps.

LINKAGE ADJUSTMENT

No service adjustments are possible or necessary for these vehicles.

CLUTCH

Clutch Assembly

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Disconnect the clutch hydraulic system master cylinder pushrod from the clutch pedal.

Clutch release bearing assembly

Hydraulic line removal

Concentric slave cylinder assembly

3. Raise and safely support the vehicle as necessary. Remove the starter.

4. Disconnect the hydraulic coupling at the transmission with a tool or depress the white retainer bushing while pulling on the hydraulic line.

5. Remove the transmission from the vehicle.

6. Mark the pressure plate and cover assembly and the flywheel, so that the parts can be reinstalled in the same position.

7. Loosen the pressure plate attaching bolts evenly and remove the clutch/pressure plate assembly.

8. Remove the clutch/pressure plate assembly from the vehicle.

9. Installation is the reverse of the removal procedure. Connect negative battery cable and bleed the hydraulic system as necessary. Roadtest the vehicle for proper operation.

PEDAL HEIGHT/FREE PLAY ADJUSTMENT

The hydraulic clutch system provides automatic adjustment. No adjustment of clutch linkage or pedal position is required.

Clutch Master Cylinder REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Raise and safely support the vehicle as necessary.

2. Disconnect the master cylinder pushrod by prying the retainer bushing and the pushrod off the shaft. Disconnect any electrical connection.

3. Remove the hydraulic line to the slave cylinder and plug the line to prevent entry of dirt.

4. Remove the master cylinder and reservoir from the engine compartment (rotate assembly as necessary). On Aerostar vehicles slide the reservoir out of the relay bracket.

5. Install in the reverse order of removal procedure. Bleed the hydraulic system.

Clutch Slave Cylinder REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Disconnect the hydraulic line.

2. Raise and safely support the vehicle as necessary. Remove the manual transmission from the vehicle.

3. Remove the bolts retaining the slave cylinder to transmission. Re-

move the concentric type slave cylinder from the transmission input shaft.

4. Installation is the reverse of the removal procedure. Tighten the concentric type slave cylinder retaining bolts to 13–19 ft. lbs. Bleed the hydraulic system.

BLEEDING THE HYDRAULIC SYSTEM

1. Clean reservoir cap. Fill reservoir to the top with approved brake fluid.

2. Raise and safely support the vehicle as necessary. Loosen the bleed screw (located in the slave cylinder body).

3. Depress the clutch pedal to the floor and hold for 2 seconds. Release the pedal. Repeat 10 times or as necessary. Close bleed screw.

4. Check fluid level add the specified fluid as required.

AUTOMATIC TRANSMISSION

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

Transmission Assembly

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Raise and safely support the vehicle as necessary.

2. Drain the transmission fluid pan. Loosen the bolts starting at the rear of the pan and working toward the front.

3. Remove the converter access cover from the bottom of the engine oil pan on 2.0L and 2.3L engines and from the right side on 2.8L, 2.9L and 3.0L engines.

4. Remove the 4 flywheel to converter attaching nuts. Rotate the crankshaft pulley clockwise (as viewed from the front) to gain access to each of the nuts.

5. Scribe a mark indexing the driveshaft to the rear axle flange. Remove the driveshaft. On 4WD applications remove the transfer case assembly.

6. Remove the speedometer cable from the extension housing.

7. Disconnect the shift rod at the transmission manual lever. Remove the kickdown cable from the ball stud lever.

8. Depress the tab on the retainer and remove the kickdown cable from the bracket.

9. Remove the starter from the converter housing.

10. Disconnect the neutral start switch wires and the converter clutch solenoid connector. Disconnect the vacuum line from the modulator.

11. Remove the filler tube. Position a jack under the transmission and remove the rear mount to crossmember nut. Remove the crossmember to frame side rail attaching bolts. Raise the transmission and remove the crossmember.

12. Disconnect the oil cooler lines at the transmission. Plug the openings to keep dirt out.

13. Remove the converter housing to engine attaching bolts.

14. Move the transmission to the rear so that it disengages the dowl pins and the converter disengages the flywheel. Lower the transmission (A4LD transmission type)) from the vehicle.

15. Install in the reverse order of removal procedure. Make sure the torque converter rotates freely and is not bound up. Always tighten all retaining bolts in progressive steps. Fill the transmission to the proper level with the specified fluid and check for fluid leakage. Road test the vehicle for proper operation.

MANUAL LINKAGE ADJUSTMENT

Aerostar

1. Raise and safely support the vehicle as necessary. Place the shift lever in the OD position.

2. Loosen the adjustment screw on the shift cable and remove the end fitting from the manual lever ball stud.

3. Position the manual lever in the Overdrive position by moving the lever all the way rearward, then 3 detents forward.

4. Hold the shift lever against the rear stop. Connect the cable end fitting to the manual lever.

5. Tighten the adjustment screw to 45–60 inch lbs.

6. Check the selector lever in all detent positions with engine running to ensure correct adjustment.

Bronco II and Ranger

1. Raise and safely support the vehicle as necessary. Position the selector lever in the D position and loosen the trunnion bolt.

2. Position the manual lever in the D position by moving the bell crank lever all the way rearward, then forward 4 detents.

3. With the floor shifter selector le-

ver and manual lever in the Drive position, apply light forward pressure to the floor shifter lower arm while tightening the trunnion bolt to 13–23 ft. lbs.

4. Check the selector lever in all detent positions with engine running to ensure correct adjustment.

TRANSFER CASE

Transfer Case Assembly

REMOVAL & INSTALLATION

Mechanical Shift Type

1. Disconnect the negative battery cable. Raise and safely support the vehicle as necessary. Remove the skid plate from the frame if so equipped.

2. Remove the drain plug and drain fluid from the transfer case.

3. Disconnect the 4WD drive indicator switch wire connector at the transfer case.

4. Disconnect the front driveshaft from the axle input yoke.

5. Loosen the clamp retaining the front driveshaft boot to the transfer case and pull the driveshaft and front boot assembly out of the transfer case front output shaft.

6. Disconnect the rear driveshaft from the transfer case output shaft yoke.

7. Disconnect the speedometer driven gear from the transfer case rear cover. Disconnect the vent hose from the control lever.

8. Loosen or remove the large bolt and the small bolt retaining the shifter to the extension housing. Pull on the control lever until the bushing slides off the transfer case shift lever pin. If necessary, unscrew the shift lever from the control lever. Remove the heat shield from the transfer case if so equipped.

9. Support the transfer case with a suitable jack. Remove the 5 bolts re-

Transfer case to extension housing bolt torque sequence

Transfer case—mechanical shift type

taining the transfer case to the transmission and the extension housing.

10. Slide the transfer case rearward off the transmission output shaft and lower the transfer case from the vehicle. Remove the gasket from between the transfer case and extension housing.

11. Installation is the reverse of removal procedure. Torque the transfer case to extension housing retaining bolts in sequence to 25-43 ft. lbs. Road test the vehicle in all ranges for correct operation.

Electronic Shift Type

1. Disconnect the negative battery cable. Raise and safely support the vehicle as necessary. Remove the skid plate from the frame if so equipped.

2. Remove the drain plug and drain fluid from the transfer case.

3. Remove the wire connector from the feed wire harness at the rear of the transfer case. Do not pull directly on the wires pull outwardly on the locking tabs.

4. Disconnect the front driveshaft from the axle input yoke.

5. Pull the driveshaft and front boot assembly out of the transfer case front output shaft.

6. Disconnect the rear driveshaft from the transfer case output shaft flange.

7. Disconnect the speedometer driven gear from the transfer case rear cover. Disconnect the vent hose from the mounting bracket.

8. Support the transfer case with a suitable jack. Remove the 5 bolts retaining the transfer case to the transmission and the extension housing.

9. Slide the transfer case rearward off the transmission output shaft and lower the transfer case from the vehicle. Remove the gasket from between the transfer case and extension housing.

10. Installation is the reverse of removal procedure. Torque the transfer case to extension housing retaining bolts in sequence to 25-43 ft. lbs. Road test the vehicle in all ranges for correct operation.

LINKAGE ADJUSTMENT

Mechanical Shift Type

1. Raise the shift boot to expose the top surface of the cam plate.

2. Loosen the bolts on the control lever assembly approximately 2 turns. Move the transfer shift lever to the 4L position.

3. Move the cam plate rearward until the bottom chamfered corner of the neutral lug just contacts the forward right edge of the shift lever.

4. Hold the cam plate in this position and tighten the 2 control lever bolts.

5. Move the in cab shift lever to all shift positions to check the positive engagement. There should be clearance (not to exceed 0.13 in.) between the shift lever and cam plate in 2H (front) 4H (rear) and 4L shift positions.

Transfer case shifter cam plate adjustment

6. Install the shift boot assembly.

DRIVE AXLE

Driveshaft and U-Joints

REMOVAL & INSTALLATION

Front Driveshaft Assembly

1. Raise and safely support the vehicle as necessary. If the alignment marks are not visible, mark the rela-

Front drive axle assembly

tionship of the rear driveshaft yoke and the drive pinion flange of the axle in line with the driveshaft so that they may be reinstalled in the same position.

2. Disconnect the rear U-joint from the companion flange. Wrap tape or equivalent around the loose bearing caps to prevent them from falling off the spider. Pull the driveshaft toward the rear of the vehicle until the slip yoke clears the transmission extension housing and the seal. Install the appropriate tool in the housing to prevent the lubricant or fluid from leaking.

3. To install, reverse the removal procedure, taking note that if either the rubber seal on the output shaft or the seal in the end of the transmission extension housing is damaged it must be replaced. Also if the lugs on the axle pinion flange are shaved or distorted so that the bearings slide, replace the flange.

4. Install the U-bolts and torque (progressive steps) the nuts to 8–15 ft. lbs. Mark the relationship of the rear driveshaft yoke and axle pinion flange before disassembly, to maintain drive-line balance. If a vibration should exist, the driveshaft should be disconnected from the axle, rotated 180 degrees and reinstalled.

Center Bearing Assembly

1. Raise and safely support the vehicle as necessary. Remove the driveshaft.

2. Remove the center support bearing attaching bolts and remove the assembly from the vehicle.

3. Do not immerse the sealed bearing in any type of cleaning fluid. Wipe the bearing and cushion clean with a cloth dampened with cleaning fluid.

4. Check the bearing for wear or rough action by rotating the inner race while holding the outer race. If wear or roughness is evident, replace the bearing. Examine the rubber cushion for evidence of hardening, cracking, or deterioration. Replace it if it is damaged in any way.

5. Place the bearing in the rubber support and the rubber support in the U-shaped support and install the bearing in the reverse order of removal.

Rear Driveshaft Assembly

1. Raise and safely support the vehicle as necessary.

2. Mark the driveshaft in relation to the flange on the transfer case and the flange on the rear axle.

3. Remove the bolts retaining the driveshaft to the transfer case flange.

4. Remove the bolts retaining the

driveshaft to the rear axle flange. Remove the driveshaft.

5. Installation is the reverse of the removal procedure. Index marks that were made during removal and torque all retaining bolts to 61–87 ft. lbs. in steps.

Front Axle Shaft, Bearing And Seal

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle as necessary. Remove the wheel/tire assemblies.

2. Remove the disc brake caliper and wire it to the frame.

3. Remove the hub locks, wheel bearings and locknuts.

4. Remove the hub, rotor and the outer wheel bearing.

5. Remove the grease seal and the inner wheel bearing from the rotor (replace grease seal upon assembly). Remove the inner and the outer races from the rotor.

6. Remove the spindle from the steering knuckle. Remove the splash shield.

7. On the right side of the vehicle, remove the shaft and joint by pulling the assembly out of the carrier. On the right side of the carrier, remove the clamp from the shaft and joint.

8. Slide the rubber boot onto the stub shaft and pull the shaft and joint from the splines of the stub shaft.

9. If required remove the needle bearing from the spindle and remove the seal from the shaft.

10. Install in the reverse order of removal. Pack all bearing and seals with multi-purpose long life lubricant. On the right side of the carrier, install the rubber boot and clamps on the stub shaft slip yoke. The splines on the shaft are phased, there is only one way to assemble the right shaft and joint assembly into the slip yoke. Align splines, slide right shaft into slip yoke install boot and clamp. On the left side of the carrier, slide the shaft and joint assembly through the knuckle and engage the splines on the shaft in the carrier.

Rear Axle Shaft, Bearing And Seal

REMOVAL & INSTALLATION

Integral Carrier Type

1. Raise the vehicle and support it safely.

2. Remove the wheel/tire assembly and the brake drums.

Pinion shaft lockbolt location—Integral carrier type

Rear axle shaft removal—Integral carrier type

3. Place a drain pan under the housing and drain the lubricant. Remove the housing cover and gasket, if used.

4. Remove the differential pinion shaft lock screw. Discard lock screw and replace with a new screw (bolt) upon installation.

5. Lift out the differential pinion mate shaft. Shaft is a slip fit design and may be removed by hand.

6. Push the axle shafts inward and remove the C-locks from the inner end of the axle shafts. Temporarily replace the shaft and lockbolt to retain the differential gears in position.

7. Remove the axle shafts. Be sure the seal is not damaged by the splines on the axle shaft.

8. Remove the bearing (using suitable tools) and oil seal from the axle housing. Inspect the axle shaft housing and axle shafts for cracks, burrs or damage.

To install:

9. Lightly coat the bearing assembly rollers with axle lubricant. Install the bearings (using the proper tools) in the axle housing until the bearing seats firmly against the shoulder.

10. Wipe all lubricant from the oil seal bore, before installing the seal. Install the oil seal.

11. Remove the lock screw and pinion shaft. Carefully slide the axle shafts into place. Be careful that you do not damage the seal with the splined end of the axle shaft. Engage the splined

Rear axle assembly—Dana model 30

end of the shaft with the differential side gears.

12. Install the axle shaft C-locks on the inner end of the axle shafts and seat the C-locks in the counterbore of the differential side gears.

13. Rotate the differential pinion gears until the differential pinion shaft can be installed. Install the differential pinion shaft lock screw. Tighten to 15–20 ft. lbs.

14. Install the brake drum and wheel/tire assemblies.

15. Install housing cover with new gasket and fill with the correct amount of the specified lubricant.

Dana Model 30

1. Raise and safely support the vehicle as necessary. Remove the wheel/tire assembly.

2. Remove the drum. Working through the hole in the axle shaft, remove the lockbolts and lockwashers which hold the axle flange to the bearing retainer plate.

3. Carefully slide the axle shaft out of the axle housing. The axle bearing/seal must be pressed (spilt retainer ring as necessary) off shaft at this point of the service procedure.

To install:

4. Clean the mating surfaces of the axle flange and the bearing retainer assembly.

5. Position a new gasket on the axle flange (with new bearing/seal assembly pressed on) and carefully slide the axle shaft into the axle housing. When the splined end of the axle shaft reaches the side gear, gently rotate the

shaft until it is inserted into the side gear.

6. Position the gasket between the axle flange and the bearing retainer and install the lockbolts and lockwashers.

7. Torque the bearing retainer bolts to 25–35 ft. lbs. Install the brake drum and wheel/tire assembly.

8. Check and add lubricant through filler hole as required.

Front Wheel Hub and Bearings

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle. Remove the wheel/tire assemblies.

2. Remove the brake caliper and wire it to the underbody to prevent damage to the brake hose.

3. Remove the retainer washers and manual or automatic hub assemblies. Remove the snapping, axle shaft spacer, thrust bearing, thrust washer and locknut (adjusting nut) assembly.

4. Remove the outer bearing. Pull the hub and rotor off the spindle. Remove and discard the grease seal.

5. Remove the inner bearing from the hub. Remove all traces of old lubricant from the bearings, hub and spindle with solvent and dry thoroughly.

6. Inspect the bearing races for scratches, pits or cracks. If the races are worn or damaged, remove them with a drift. If the inner or outer bearing races were removed, replace them

in the hub with the proper tool. The races will be properly seated when they are fully bottomed.

7. Replace the grease retainer. Pack the inside of the hub with lithium base grease, high temperature multi-purpose long life lubricant. Fill the hub until the grease is flush with the inside diameters of both bearing races.

8. Pack the bearings with wheel bearing grease, working as much lubricant as possible between the rollers and the cages.

9. For installation reverse the removal procedure. Adjust the wheel bearings.

ADJUSTMENT

Manual Locking Hubs

1. Raise and safely support the vehicle. Remove the wheel/tire assembly. Remove the retainer washers from the lug nut studs and remove the manual locking hub assembly from the spindle.

2. Remove the snapping from the end of the spindle shaft. Remove the axle shaft spacer, needle thrust bearing and the bearing spacer.

3. Remove the outer wheel bearing locknut and the washer from the spindle.

4. Loosen the inner wheel bearing locknut and then tighten to 35 ft. lbs. to seat the bearings.

5. Spin the rotor and back off the inner locknut ¼ turn. Retighten the inner locknut to 16 inch lbs.

6. Install the lockwasher and the

outer wheel bearing locknut and tighten to 150 ft. lbs.

7. Install bearing thrust spacer, needle thrust bearing and axle shaft spacer. Install snapping onto the end of the spindle. Install hub assembly over the spindle. The final endplay should be 0.001–0.003 in. with wheel/tire assembly on spindle.

Automatic Locking Hubs

1. Raise and safely support the vehicle as necessary. Remove the wheel/tire assembly. Remove the retainer washers from the lug nut studs and remove the automatic locking hub assembly from the spindle. Remove the snapping from the end of the spindle shaft.

2. Remove the axle shaft spacer, needle thrust bearing and the bearing spacer.

3. Pull the plastic cam assembly off the wheel bearing adjusting nut and remove the thrust washer and needle thrust bearing from the adjusting nut.

4. Loosen the wheel bearing adjusting nut from the spindle. While rotating the hub and rotor, tighten the wheel bearing adjusting nut to 35 ft. lbs. to seat the bearings.

5. Spin the rotor and back off the nut $\frac{1}{4}$ turn (90 degrees). Retighten the nut to 16 inch lbs. using a torque wrench. Align the closest hole in the wheel bearing adjusting nut with the center of the spindle keyway slot. Advance the nut to the next lug if required. Install the separate locking key in the spindle keyway under the adjusting nut.

6. Install the locknut needle bearing and thrust washer in the order of removal and push or press the cam assembly onto the locknut by lining up the key in the fixed cam with the spindle keyway.

7. Install the bearing thrust washer, needle thrust bearing and axle shaft spacer. Clip the snapping onto the end of the spindle.

8. Install the automatic locking hub assembly over the spindle by lining up 3 legs in the hub assembly with 3 pockets in the cam assembly. Install the retainer washers.

9. Install the wheel/tire assembly. Install and tighten lugnuts. The final endplay should be 0.001–0.003 in. with wheel/tire assembly on spindle.

Manual Locking Hubs

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely.

2. Remove the wheel lug nuts and remove the wheel/tire assembly.

3. Remove the retainer washers from the lug nut studs and remove the manual locking hub assembly. To remove the internal hub lock assembly from the outer body assembly, remove the outer lock ring seated in the hub body groove. The internal assembly, spring and clutch gear will now slide out of the hub body. Do not remove the screw from the plastic dial.

4. Rebuild the hub assembly in the reverse order of disassembly.

5. Adjust the wheel bearing if necessary. Install the manual locking hub assembly over the spindle and place the retainer washers on the lug nut studs.

6. Install the wheel/tire assembly.

Automatic Locking Hubs

REMOVAL & INSTALLATION

1. Raise and support the vehicle

safely. Remove the wheel lug nuts and remove the wheel/tire assembly.

2. Remove the retainer washers from the lug nut studs and remove the automatic locking hub assembly from the spindle.

3. Remove the snapping from the end of the spindle shaft.

4. Remove the axle shaft spacer, needle thrust bearing and the bearing spacer. Being careful not to damage the plastic moving cam, pull the cam assembly off the wheel bearing adjusting nut and remove the thrust washer and needle thrust bearing from the adjusting nut.

5. Adjust the wheel bearing if necessary. Loosen the wheel bearing adjusting nut from the spindle using a $2\frac{3}{8}$ in. hex socket tool.

6. While rotating the hub and rotor assembly, tighten the wheel bearing adjusting nut to 35 ft. lbs. to seat the bearings, then back off the nut $\frac{1}{4}$ turn 90 degrees.

7. Retighten the adjusting nut to 16 inch lb. using a torque wrench. Align the closest hole in the wheel bearing adjusting nut with the center of the spindle keyway slot. Advance the nut to the next lug if required. Install the separate locking key in the spindle keyway under the adjusting nut.

8. Install the locknut needle bearing and thrust washer in the order of removal and push or press the cam assembly onto the locknut by lining up the key in the fixed cam with the spindle keyway.

9. Install the bearing thrust washer, needle thrust bearing and axle shaft spacer. Clip the snapping onto the end of the spindle.

10. Install the automatic locking hub assembly over the spindle by lining up the 3 legs in the hub assembly with 3 pockets in the cam assembly. Install the retainer washers.

Automatic locking hub assembly

Manual locking hub assembly

11. Install the wheel/tire assembly. Install and tighten lugnuts. Final endplay of the wheel on the spindle should be 0.001–0.003 in.

Pinion Seal

REMOVAL & INSTALLATION

NOTE: This service procedure disturbs the pinion bearing preload and this preload must be carefully reset when assembling.

1. Raise the vehicle and support it safely.
2. Remove the wheels and the brake drums.
3. Mark the driveshaft axle end flange and the axle companion flange for correct installation. Remove the driveshaft.
4. Using an inch pound torque wrench on the pinion nut, record the torque required for rotation of the pinion through several revolutions.
5. While holding the companion flange remove the pinion nut. Mark the companion flange in relation to the pinion shaft for reinstallation.
6. Using a suitable puller remove the rear axle companion flange. To remove the seal, pry it out of the carrier.
7. Installation is the reverse of the removal procedure. Tighten the new pinion nut rotating the pinion to insure proper bearing seating. Take pinion bearing torque preload readings until the original recorded preload reading is obtained or 8–14 inch lbs. specification is reached. Under no circumstances should the pinion nut be backed off to reduce preload. If reduced preload is required, a new collapsible pinion spacer and pinion nut must be installed.

Front Drive Axle Housing

REMOVAL & INSTALLATION

1. Raise the vehicle and support it safely under the radius arm brackets.
2. Disconnect the driveshaft from the front axle yoke. Remove the wheel/tire assembly.
3. Remove the disc brake calipers and support them on a frame rail as necessary.
4. Disconnect the steering linkage from the spindle.
5. Position a jack under the axle arm and slightly compress the coil spring. Remove the nut that retains the lower part of the spring to the axle arm. Lower the jack and remove the coil spring, spacer, seat and stud.
6. Disconnect the shock absorber from the radius arm bracket. Remove the bracket and radius arm from the axle arm.
7. Remove the pivot bolt that secures the right axle arm assembly to the crossmember.
8. Remove the clamps securing the axle shaft boot from the axle shaft slip yoke and axle shaft and slide the rubber boot over. Disconnect the right driveshaft from the slip yoke assembly. Lower the jack and remove the right axle arm assembly.
9. Position another jack under the differential housing. Remove the bolt that connects the left axle arm to crossmember. Lower the jacks and remove the left axle arm assembly.
10. Install in the reverse order of removal. Tighten the pivot bracket bolts to 120–150 ft. lbs. Tighten the radius arm to axle arm new stud to 190–230 ft. lbs. and the tie rod to ball joint nut to 50–75 ft. lbs.

Rear Drive Axle Housing

REMOVAL & INSTALLATION Aerostar

1. Raise and safely support the vehicle as necessary.
2. Release the parking brake cable tension by pulling rearward on the front cable. Clamp the cable behind the crossmember to release the tension on the rear cables.
3. On some vehicles release the parking brake cable tension by removing the boot cover from the parking brake control assembly. Place the control in the released position. Insert a pin through the pawl lock out pin hole the pin must be inserted from the in-board side (larger hole) of the control assembly to displace the self-adjusting pawl.
4. Remove the cables from the equalizer. Pull the cables through the rear crossmember.
5. Mark the driveshaft to the rear axle for correct installation. Remove the driveshaft. Remove the wheel/tire assemblies.
6. Disconnect the brake lines at the master cylinder rear tube.
7. Disconnect the shock absorbers from the lower control arm.
8. Lower the axle until the springs are no longer under compression. Remove the coil springs assembly.
9. Raise the axle to the normal load position and disconnect the control arms at the axle. Remove the upper control arm from the axle.
10. Mark the position of the cam adjuster in the axle bushing. Lower the axle from the vehicle.
11. Install in the reverse order of removal procedure.

Bronco II and Ranger

1. Raise the vehicle and support it

Rear axle assembly installation

safely under the rear frame crossmember.

2. Remove the cover and drain the lubricant.

3. Remove both rear wheel/tire assemblies and remove the drums.

4. Remove the 4 retaining nuts from each backing plate to underbody.

5. Remove the vent hose from the axle housing.

6. Remove the brake line from the clips that retain the line to the axle housing.

7. Remove the hydraulic brake T-fitting from the axle housing.

8. Mark the driveshaft end yoke and the axle U-joint flange for proper reassembly. Remove the driveshaft.

9. Support the rear axle housing on a jack, then remove the spring clip U-bolt nuts. Remove the U-bolts and plates.

10. Disconnect the lower shock absorber studs from the mounting brackets on the axle housing. Lower the axle housing and remove it from under the vehicle.

11. Installation is the reverse of the removal procedure.

horn switch assembly from the steering wheel.

3. Remove all electrical connections and remove horn switch cover assembly.

4. Remove steering wheel retaining nut. Using a suitable puller remove the steering wheel from the steering shaft. Do not hammer or use knock off type puller on steering wheel.

5. Installation is the reverse of the removal procedure. Install the steering wheel in the noted position. Tighten the steering wheel retaining nut to 23-33 ft. lbs.

Manual Steering Gear

REMOVAL & INSTALLATION

1. Raise the vehicle and support it safely with the front wheels in the straight ahead position.

2. Disengage the flex coupling shield from the steering gear input shaft shield and slide it up the intermediate shaft.

3. Disconnect the flex (rag joint) coupling from the steering shaft flange by removing the attaching nuts. Remove shaft shield if so equipped

4. Disconnect the pitman arm from the sector shaft.

5. Mark and remove the pitman arm from the gear sector shaft using proper pulling tools.

NOTE: Do not hammer on the end of the sector shaft or the tool, this will damage the steering gear.

6. While supporting the steering gear, disconnect it from the frame side rail. Lower the gear assembly from the vehicle.

7. Install in the reverse order of removal. Before installing the gear, ro-

Typical manual steering gear installation

tate the input shaft from stop to stop counting the total number of turns. Then turn back exactly half way, placing the gear on center. Make sure that the flat on the gear input shaft is facing straight up and aligns with the flat on the flex coupling. Tighten steering gear mounting bolts to 54-66 ft. lbs. and pitman arm retaining nut to 170-230 ft. lbs. Road test the vehicle for proper operation.

ADJUSTMENT

Preload and Meshload

GEAR IN VEHICLE

1. Make sure that the steering column is properly aligned and that the intermediate shaft flex coupling is not distorted.

2. Raise and safely support the vehicle as necessary. Disconnect the pitman arm at the ball stud.

3. Lubricate the wormshaft seal with a drop of automatic transmission fluid.

4. Remove the horn pad assembly from the steering wheel and turn the wheel to one stop.

5. Using a torque wrench on the steering wheel nut, measure the torque (preload) required to rotate the

STEERING

Steering Wheel

REMOVAL & INSTALLATION

1. Position the vehicle in a straight head position. Note position of the steering wheel. Disconnect the negative battery cable(s).

2. Remove the screw underside each steering wheel spoke and lift the

steering wheel at a constant speed for approximately 1½ turns.

6. If the gear preload is not within 2–6 inch lbs. the preload must be readjusted. Gear must be removed to adjust worm preload.

7. Rotate the steering wheel from stop to stop counting the number of turns then back halfway, placing the steering gear in the center position.

8. Place a torque wrench on the steering wheel nut, observe the highest reading (meshload) by rotating the steering shaft 90 degrees either way across center. The meshload must be within 4–10 inch lbs. and at least 2 inch lbs. over the preload. Meshload can be adjusted in the vehicle.

GEAR REMOVED

1. Tighten the selector cover bolts to 40 ft. lbs. Loosen preload adjuster locknut and tighten the worm bearing adjuster nut until all endplay has been removed.

2. Using a torque wrench and socket on wormshaft turn the wormshaft all the way to the right. Measure the left turn torque (preload) required to rotate the wormshaft at a constant speed for approximately 1½ turns.

3. Tighten or loosen the adjuster locknut until the correct preload (5–6 inch lbs.) is obtained. Torque locknut to 187 ft. lbs.

4. Rotate the wormshaft from stop to stop, counting the total number of turns, turn back halfway placing the gear on the center position.

5. With the torque wrench still on

wormshaft, observe the highest reading (meshload) by rotating the wormshaft 90 degrees either way across center. The meshload must be within 9–11 inch lbs. and at least 4 inch lbs. over the preload.

6. Turn the selector shaft adjusting screw as required. Hold the sector shaft adjusting screw and tighten locknut to 25 ft. lbs.

Manual Rack and Pinion

REMOVAL & INSTALLATION

1. Raise the vehicle and support it safely with the front wheels in the straight ahead position.

2. To center the steering gear, rotate the input shaft from stop to stop counting the total number of turns. Then turn back exactly half way placing the gear on center.

3. Remove the bolt retaining the intermediate steering column shaft to the steering gear pinion. Separate the shaft from the pinion.

4. Separate the tie rod ends from the spindle arms using a suitable puller.

5. Support the steering gear and disconnect it from the crossmember. Remove the gear from the vehicle.

6. Installation is the reverse of the removal procedure.

ADJUSTMENT

The gear preload on a manual rack and pinion steering gear is determined by the pinion plug torque valve and is preset at the factory.

Power Steering Gear

REMOVAL & INSTALLATION

1. Disconnect the pressure and return lines from the gear. Plug the lines and the ports in the gear to prevent entry of dirt.

2. If equipped, remove the splash shield from the flex coupling. Disconnect the flex coupling at the steering gear.

3. Raise the vehicle and support it safely. Remove the pitman arm from the sector shaft.

4. Support the steering gear and remove the attaching bolts. Work the steering gear free from the flex coupling and remove the gear from the vehicle.

5. Install in the reverse order of removal procedure. Bleed power steering system if necessary.

ADJUSTMENT

1. Make sure that the steering column is correctly aligned and remove the steering wheel cover. Raise and safely support the vehicle as neces-

Typical power steering gear installation

sary. Disconnect the pitman arm from the sector shaft.

2. Disconnect the fluid reservoir return line and cap the reservoir return line tube. Place the end of the return line in a clean container and turn the steering wheel back and forth several times to empty the steering gear.

3. Turn the steering wheel to 45 degrees from the right stop.

4. Attach an inch pound torque wrench to steering wheel nut and record the torque to rotate the shaft $\frac{1}{8}$ turn toward center from the 45 degree position.

5. Turn the steering gear back to center and record the torque required to rotate the shaft back and forth across the center position. The set torque specification is measured rocking across center to a value of 10-14 inch lbs. greater than that measured 45 degrees from the right stop.

6. Loosen the locknut and tighten the sector shaft adjusting screw until the reading is the specified value greater than the torque at 45 degrees from the stop.

7. Tighten the adjusting screw locknut and recheck. Install pitman arm and steering wheel cover.

8. Refill the system with the fluid specified. Bleed the system.

Power Rack and Pinion

REMOVAL & INSTALLATION

1. Place the steering system in the on center position by rotating the steering wheel from stop to stop, counting the number of turns. Divide the number by 2 to determine the half way point.

2. Disconnect the negative battery cable and leave the ignition key in the ON position. Raise the vehicle and support it safely.

3. Disconnect the pressure and return lines from the steering gear valve housing. Plug the lines and ports in the gear valve housing to prevent the entry of dirt.

4. Remove the bolt retaining the lower intermediate steering column shaft to the steering gear. Disconnect the shaft from the gear. Separate the tie rod ends from the spindle arms using suitable tools.

5. Support the steering gear and disconnect it from the crossmember. Remove the gear from the vehicle.

6. Install in the reverse order of removal procedure.

ADJUSTMENT

No service adjustments are necessary on this system.

Typical power rack and pinion steering gear

Typical power steering pump installation

Power Steering Pump

REMOVAL & INSTALLATION

Saginaw Type

1. Raise and safely support the vehicle as necessary. Disconnect the pressure and return lines from the pump and plug them to prevent loss of fluid or entrance of dirt into the system.

2. Loosen the belt tension adjusting bolt all the way.

3. Remove the bolts attaching the pump mounting bracket to the air conditioning bracket (if equipped).

4. Remove the pump, mounting bracket and pulley assembly.

5. Installation is the reverse of the removal procedure. Adjust belt tension. Refill and bleed system if necessary.

C-II Type

NOTE: The C-II pump is equipped with a fiberglass reservoir and can be identified by the reservoir. Never pry against the fiberglass, as damage will occur.

1. Raise and safely support the vehicle as necessary. To remove the power steering fluid from the pump reservoir, disconnect the fluid return hose at the reservoir and drain the fluid into a container. Remove the pressure hose from the pump.

2. Loosen idler pulley assembly pivot and adjustment bolts or adjustment nut and slider bolt.

3. Remove the drive belt from the pulley and dipstick tube if necessary. Remove support brace if so equipped.

4. Remove the power steering pump bracket retaining bolts. Remove the power steering pump with bracket and pulley from the vehicle.

5. Installation is the reverse of the removal procedure. Fill the reservoir with power steering fluid, start the engine and turn the steering wheel from stop to stop to remove air from the system. Check for leaks and recheck the fluid level. Add fluid if necessary.

BELT ADJUSTMENT

1. Check belt tension with a belt tension gauge. New belt tension is 100-190 lbs. and used belt tension is 80-160 lbs. Use the belt tension pa-

Devac air purging tool

rameters as a guideline for belt adjustment.

2. On vehicles equipped with pivot type adjustment brackets, loosen the pivot bolts. Insert a tool in adjustment slot, raise upward and tighten pivot bolts.

3. On vehicles equipped with slider type adjustment bracket, loosen the bolts in the slider slots and position pump to obtain the correct belt tension. Tighten all bolts.

4. Recheck and adjust belt if necessary.

SYSTEM BLEEDING

Conventional Method

1. Check and fill the power steering pump reservoir oil level to the correct level.

2. Run engine. Turn the steering wheel, approximately 5 times, a full cycle (without hitting the stops). This will help remove air trapped in the system.

3. Check fluid level add fluid as necessary.

Devac Method

NOTE: A fabricated Devac purging tool must be used for this service procedure.

1. Check the pump reservoir oil level (must be at correct level).

2. Insert the rubber stopper end of an air evacuator assembly into the filler tube tightly.

3. Connect a length of hose from the other end of the evacuator to a distributor machine or an air conditioner vacuum pump. Do not use engine vacuum.

4. Let the engine idle for 15 minutes. Turn the steering wheel a full cycle (without hitting the stops) every 5 minutes. This will help remove air trapped in the system.

5. Disconnect and remove the evacuator and reinstall the filler tube dipstick.

Tie Rod Ends

REMOVAL & INSTALLATION

NOTE: Replace the drag link or

tie rod if a ball stud is excessively loose or if the drag link or tie rod is bent. Do not attempt to straighten a drag link or tie rod.

1. Raise and safely support the vehicle as necessary. Remove the cotter pin and nut from the tie rod ball studs.

2. Using suitable tools, remove tie rod ball studs from spindle and drag link. On Aerostar, remove tie rod ball stud from spindle and loosen tie rod jam nut.

3. If replacing just one tie rod end remove the end from the the adjusting sleeve. Always record the number of turns to remove the tie rod end from sleeve. When installing this will provide approximate toe in setting.

4. Installation is the reverse of the removal procedure. Always position adjusting sleeve clamp towards engine (nut faces front of engine). Tighten ball stud nut to 50-75 ft. lbs., use new cotter pins and check front end alignment.

BRAKES

For all brake system repair and service procedure not detailed below, please refer to "Brakes" in the Unit repair section.

Master Cylinder

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable(s). Disconnect the brake warning lamp electrical connection from master cylinder.

2. Disconnect the hydraulic lines from the master cylinder.

Checking distance of brake booster pushrod

3. Remove the brake booster to master cylinder retaining nuts. Remove the master cylinder from the brake booster.

4. Installation is the reverse of the removal procedure. Before installing the master cylinder, check the distance from the outer end of the booster assembly pushrod, to the front face of the brake assembly. The service specification (Bendix booster) is 0.995 in. Bleed brake system as required.

Power Brake Booster

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Remove retaining nuts and master cylinder from booster.

2. Loosen hose clamp and remove manifold vacuum hose from booster.

3. From inside the cab, remove the hairpin retainer and plastic bushings and disconnect the booster pushrod from the brake pedal. The stoplight switch must be positioned off brake pedal arm.

4. Remove nuts that retain the booster mounting bracket to the dash panel.

5. Remove the booster assembly from engine compartment.

To install:

6. Mount the booster and bracket assembly to the engine side of the dash panel by sliding the bracket mounting bolts and valve operating rod in through the holes in the dash panel.

7. From inside the cab, install the booster mounting bracket to dash panel retaining nuts.

8. Position the master cylinder to the booster assembly and install the retaining nuts.

9. Connect the manifold vacuum hose to the booster and secure with clamp.

10. From inside the cab connect the booster valve operating rod to the brake pedal with the hairpin retainer and plastic bushings. Reposition the stoplight switch on the brake pedal arm and reconnect the battery cable. Start engine and check operation of the brake system.

Brake Caliper

REMOVAL & INSTALLATION

1. Siphon part of the brake fluid out of the master cylinder to avoid overflow when the caliper piston is pressed into the cylinder bore.

2. Raise the vehicle and support it safely. Remove the wheel/tire assembly.

3. Position a 8 in. C-clamp on the caliper and tighten the clamp to bot-

tom the piston in the caliper cylinder bore. Remove clamp.

4. Drive the upper caliper pin (compress pin tabs) out the caliper slide groove with a brass rod and light hammer.

5. Drive the lower caliper pin (compress pin tabs) out the caliper slide groove with a brass rod and light hammer.

6. Disconnect the brake hose from the inlet port. Cap the hose and inlet port to prevent fluid leakage.

7. Remove the caliper from the spindle assembly by pushing it downward against the spindle and rotating the upper end upward out of the spindle assembly.

8. Installation is the reverse of the removal procedure. The tabs on each end of the caliper pin must catch on the spindle face. Adjust rear brakes and bleed brake system as required.

Spindle, wheel and caliper assembly—Aerostar

Disc Brake Pads

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle. Remove the wheel/tire assembly. Remove the caliper assembly.

2. Remove the outer shoe and lining from the caliper. Remove the inner shoe and lining from the spindle assembly. Remove the shoe anti-rattle clip from the lower shoe abutment surface on the spindle assembly.

3. Thoroughly clean the areas of the caliper and spindle assembly that come in contact during the sliding action of the caliper.

4. Installation is the reverse of the removal procedure. Use new components as required. Adjust rear brakes and bleed the system as required.

Brake Rotor

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle. Remove the wheel/tire assembly.

2. Remove the caliper assembly from the rotor and support it out of the way with wire or equivalent.

3. Remove the dust cap, cotter pin, nut, washer and outer bearing and remove the rotor from the spindle.

4. On 4WD vehicles, the locking hub assembly must also be removed.

5. Install in the reverse order of removal procedure. Adjust wheel bearings. If replacing rotor assembly, always replace the grease seal for inner bearing.

Brake Drum

REMOVAL & INSTALLATION

1. Raise and safely support the ve-

hicle. Remove the wheel/tire assembly.

2. Remove the spring retaining nuts (if equipped) and remove the brake drum.

3. Install in the reverse order of removal procedure. If brake drum will not come off, insert a narrow tool through the brake adjusting hole in the backing plate and disengage the adjusting lever while loosening the brake adjusting screw.

Brake Shoe

REMOVAL & INSTALLATION

NOTE: Before removing brake shoes record color and position of all brake springs they must be installed in their original position. Only service one side at a time so the other side may be used as a guide.

1. Raise and safely support the vehicle. Remove the wheel/tire assembly. Remove the brake drum.

2. Install a brake cylinder clamp around wheel cylinder to stop it from expanding.

3. Remove the bottom brake adjuster retaining spring. Remove the self-adjusting cable from the lever. Remove lever and brake adjuster.

4. Remove the primary shoe to anchor spring.

5. Remove the secondary shoe to anchor spring. Remove the cable guide and cable from the secondary shoe.

6. Remove the left and right shoe hold down spring.

7. Remove the parking brake link and spring assembly (note position for correct installation). Disconnect the parking brake cable from the brake lever.

8. Remove the brake shoes. Remove the parking brake lever from the sec-

Rear brake shoe assembly

ondary shoe by removing the retaining clip and spring washer.

9. Installation is the reverse of the removal procedure. The primary shoe (short shoe) always is installed toward the front of the vehicle. The secondary shoe (long shoe) is installed toward the rear of the vehicle. Replace all brake springs as necessary. Lube with white brake grease where the brake shoes touch the backing plate. Check the brake fluid and adjust the brake system.

Wheel Cylinder

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle. Remove the wheel, drum and brake shoes.

2. Remove the wheel cylinder to shoe connecting pins.

3. Disconnect the brake line from the wheel cylinder.

4. Remove the wheel cylinder retaining bolts and remove the cylinder from the brake backing plate.

5. Installation is the reverse of the removal procedure. Adjust the brakes and bleed the system as required.

Parking Brake Cable

REMOVAL & INSTALLATION

Aerostar

EQUALIZER-TO-CONTROL ASSEMBLY

1. Place the parking brake hand control in the released position. Release the parking brake cable tension as follows:

a. Remove the boot cover from the parking brake control assembly.

b. Insert a steel pin through the pawl lockout pin hole. The pin must be inserted from the inboard side of the control at a upward and forward angle then moved downward and rearward to displace the self adjusting pawl to be inserted through the other hole. This locks out the self adjusting pawl.

c. With a suitable tool rotate the spring loaded wheel (self adjuster mechanism) back as far as possible to release cable tension.

2. Raise and safely support the vehicle. Disconnect the rear parking brake cables from the equalizer. Remove the equalizer from front cable.

3. Remove the cover from the underbody reinforcement bracket. It may be necessary to loosen fuel tank straps and lower fuel tank to gain access to cover.

4. Remove the cable anchor pin from the pivot hole in the control ratchet plate. Guide the front cable from the control.

5. Compress the retainer fingers of the cable and push the retainer rearward through the hole.

6. Compress the retainer fingers on the rear crossmember and remove the retainer from the rear crossmember.

7. Pull the cable ends through the crossmember and remove the cable.

8. Install in the reverse order of removal procedure.

EQUALIZER-TO-REAR WHEEL

1. Release parking brake hand control.

2. Release the parking brake cable

Releasing parking brake cable tension—Aerostar

tension. Raise and safely support the vehicle. Remove the wheel/tire assembly and brake drum.

3. Disconnect the rear parking brake cable from the equalizer.

4. Compress the prongs that retain cable to crossmember and pull out the cable and housing.

5. Working on the wheel side, compress the prongs on the cable retainer so they can pass through the hole in the brake backing plate.

6. Lift the cable out of the slot in the parking brake lever (attached to secondary brake shoe) lever and remove the cable through the brake backing plate hole.

7. Install in the reverse order of removal procedure.

Bronco II and Ranger

EQUALIZER-TO-CONTROL ASSEMBLY

1. Raise and safely support the vehicle. Release parking brake control.

2. Back off the equalizer nut and remove slug of front cable from the tension limiter.

3. Remove the parking brake cable from the bracket or crossmember.

4. Remove the forward ball end of the parking brake cable from the control clevis.

5. Remove the cable from the control assembly.

6. Using a cord attached to the control lever end of the cable, remove the cable from the vehicle pulling it up into the passenger compartment.

7. Install in the reverse order of removal procedure.

EQUALIZER-TO-REAR WHEEL

1. Release parking brake control.

2. Raise and safely support the vehicle. Remove the wheel/tire assembly and brake drum.

3. Remove the locknut on rod at equalizer. Disconnect the rear parking brake cable from the equalizer.

4. Compress the prongs that retain cable to crossmember and pull out the cable and housing.

5. Working on the wheel side, compress the prongs on the cable retainer so they can pass through the hole in the brake backing plate.

6. Lift the cable out of the slot in the parking brake lever (attached to secondary brake shoe) lever and remove the cable through the brake backing plate hole.

7. Install in the reverse order of removal procedure.

ADJUSTMENT

Aerostar

On these vehicles the parking brake

system is self adjusting and requires no adjustment.

Bronco II and Ranger

INITIAL ADJUSTMENT

NOTE: Use this service adjustment procedure when a new tension limiter installed. Adjust rear brakes before adjusting parking brake. Brake drums must be cold for correct adjustment.

1. Depress the parking brake to last detent position.

2. Raise and safely support the vehicle as necessary. Grip the tension limiter housing and tighten the equalizer nut $2\frac{1}{2}$ in. up the rod.

3. Check to make sure cinch strap has $1\frac{3}{8}$ in. remaining.

4. Release parking brake and check for proper operation.

FIELD ADJUSTMENT

NOTE: Use this service adjustment procedure to correct a slack system if a new tension limiter is not installed. Adjust rear brakes before adjusting parking brake.

1. Vehicle drums must be cold for correct adjustment. Depress the parking brake to last possible detent position.

2. Raise and safely support the vehicle as necessary. Grip the tension limiter housing and tighten the equalizer nut 6 full turns past the original position.

3. Using a cable tension guide or equivalent the tension should be 400–600 lbs. in front of the equalizer assembly. If tension is low repeat Step 2.

4. Release parking brake and check for rear wheel drag. There should be no brake drag.

FRONT SUSPENSION

Shock Absorbers

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle as necessary. Remove the nut and the washer that attaches the shock absorber to the spring seat.

2. Remove the nut and bolt that retain the shock absorber to the radius arm and lower shock bracket.

3. Slightly compress the shock and remove it from the vehicle.

4. On Aerostar remove the 2 bolts retaining the shock absorber to the

4 FORD MID SIZE AEROSTAR • BRONCO II • RANGER

Front suspension-Aerostar

Front suspension-Bronco II and Ranger 2WD

Front suspension—Bronco II and Ranger 4WD

bottom of the lower control arm. Remove the shock through the lower control arm.

5. Installation is the reverse of the removal procedure.

Coil Springs

REMOVAL & INSTALLATION

Aerostar

1. Place the steering wheel and the steering system in the on center position.

2. Raise and safely support the vehicle. Remove the wheel/tire assembly.

3. Disconnect the stabilizer link bolt from the lower arm.

4. Remove the 2 bolts attaching the shock to the lower arm. Remove the upper nut and washer and remove the shock.

5. Remove the steering center link from the pitman arm if necessary.

6. Using spring compressor tool D78P-5310-A or equivalent, install one plate with the pivot ball seat facing downward into the coils of the spring. Rotate the plate so that it is flush with the upper surface of the lower arm.

7. Install the other plate with the pivot ball seat facing upward into the coils of the spring. Insert the upper ball nut through the coils of the spring, so that the nut rests in the upper plate.

8. Insert the compression rod into the opening in the lower arm, through the upper and lower plate and upper ball nut. Insert the securing pin through the upper ball nut and the

compression rod. Tighten the forcing nut until the spring is compressed enough so that it is free in its seat.

9. Loosen the lower arm pivot bolts. Remove the cotter pin and loosen but do not remove the nut attaching the lower ball joint to the spindle. Loosen the lower ball joint nut. Support the lower control arm and remove the ball joint nut. Lower the control arm and remove the spring assembly.

10. Reverse the removal procedure for installation. Installed upper and lower insulator plates in the correct position.

Bronco II and Ranger

1. Raise the front of the vehicle and support it safely. Also put a jack under the axle.

2. Disconnect the shock absorber from the lower bracket.

3. Remove the spring lower retainer attaching nuts and remove the lower retainer.

4. Slowly lower the axle and remove the spring. Rotate the spring to clear upper spring retainers.

5. Installation is the reverse of the removal procedure.

Upper Ball Joints

INSPECTION

NOTE: Always check/adjust the wheel bearings before ball joint inspection service procedure.

1. On Aerostar vehicles, raise and safely support the vehicle so that the

wheel assemblies hang free. On Bronco II and Ranger vehicles, raise the vehicle and support the I-Beam axle beneath the coil spring so that spring is compressed.

2. On Aerostar vehicles, move the (upper part) wheel in and out. Observe the upper spindle arm and the upper control arm. On Bronco II and Ranger vehicles, move the (upper part) wheel in and out. Observe the upper spindle arm and the upper part of the axle jaw.

3. A $\frac{1}{32}$ in. or greater movement between inspection points indicates that the upper ball joint must be replaced.

REMOVAL & INSTALLATION

Aerostar

NOTE: The upper ball joint and the upper control arm are serviced as a complete assembly.

1. Place the steering wheel and the steering system in the on center position (wheels straight ahead).

2. Raise the vehicle and support it safely under the body rails.

3. Remove the spindle. Remove the cowl drain bracket and the bolt retainer plate.

4. Mark the position of the control arm mounting brackets on the flat plate. Note number and location of shims if so equipped.

5. Remove the bolt and washer retaining the front bracket to the flat plate.

6. From beneath the rail, remove the 3 nuts from the bolts retaining the 2 upper control arm mounting brackets to the body rail.

7. Remove the 3 long bolts retaining the mounting brackets to the body rail by rotating the upper control arm out of position in order to remove the bolts.

8. Remove the upper control arm, upper ball joint and mounting bracket assembly and flat plate from the vehicle.

9. Installation is the reverse of the removal procedure. Install shims (correct number) in the proper location. The torque required for the mounting bracket to body rails nuts and bolts is very important. The torque specification is 145–195 ft. lbs. Make sure the mounting brackets do not move from the marked position on the flat plate. Check/adjust the front end alignment as required.

Bronco II and Ranger

1. Raise and safely support the vehicle as necessary.

2. Remove the spindle/ball joint assembly from axle.

3. Remove the snapping from the upper ball joint if so equipped.

4. Assemble the C-frame tool T74P-4635-C and reciever cup tool D81T-3010-A or equivalent on the upper ball joint.

5. Turn the forcing screw until the ball joint is removed from the spindle assembly.

6. Installation is the reverse of the removal procedure. Do not heat the ball joint or the spindle to aid in removal. Always remove or install lower ball joint to spindle assembly first when servicing upper ball joint.

Lower Ball Joints

INSPECTION

NOTE: Always check/adjust the wheel bearings before ball joint inspection service procedure.

1. On Aerostar vehicles, raise and safely support the vehicle so that the wheel assemblies hang free. On Bronco II and Ranger vehicles, raise the vehicle and support the I-Beam axle beneath the coil spring so that spring is compressed.

2. On Aerostar vehicles, move the (lower part) wheel in and out. Observe the lower spindle jaw and the lower control arm. On Bronco II and Ranger vehicles, move the (lower part) wheel in and out. Observe the lower spindle arm and the lower part of the axle jaw.

3. A $\frac{1}{32}$ in. or greater movement between inspection points indicates that the lower ball joint must be replaced.

REMOVAL & INSTALLATION

Aerostar

NOTE: The lower ball joint and the lower control arm are serviced as a complete assembly.

1. Place the steering and the steering system in the on center position (wheels straight ahead).

2. Raise the vehicle and support it safely under the frame.

3. Remove the coil spring.

4. Remove the bolts and nuts retaining the control arm to the No.1 crossmember. Remove the lower control arm.

5. Install in the reverse order of removal. Final torque is with vehicle in normal ride position. The lower control arm to crossmember torque specification is 100–140 ft. lbs.

Bronco II and Ranger

1. Raise and safely support the vehicle as necessary.

2. Remove the spindle/ball joint assembly from axle.

3. Remove the snapping from the lower ball joint if so equipped.

4. Assemble the C-frame tool T74P-4635-C and reciever cup tool D81T-3010-A or equivalent on the lower ball joint.

5. Turn the forcing screw until the ball joint is removed from the spindle assembly.

6. Installation is the reverse of the removal procedure. Do not heat the

ball joint or the spindle to aid in removal. Always remove or install lower ball to spindle assembly first.

Upper Control Arms

REMOVAL & INSTALLATION

Aerostar

1. Place the steering wheel and the steering system in the on center position (wheels straight ahead).

2. Raise the vehicle and support it safely under the body rails.

3. Remove the spindle. Remove the cowl drain bracket and the bolt retain-er plate.

4. Mark the position of the control arm mounting brackets on the flat plate. Note number and location of shims if so equipped.

5. Remove the bolt and washer retaining the front bracket to the flat plate.

6. From beneath the rail, remove the 3 nuts from the bolts retaining the 2 upper control arm mounting brackets to the body rail.

7. Remove the 3 long bolts retaining the mounting brackets to the body rail by rotating the upper control arm out of position in order to remove the bolts.

8. Remove the upper control arm, upper ball joint and mounting bracket assembly and flat plate from the vehicle.

9. Installation is the reverse of the

Front lower control arm assembly—Aerostar

Front upper control arm assembly—Aerostar

removal procedure. Install shims (correct number) in the proper location. The torque required for the mounting bracket to body rails nuts and bolts is very important. The torque specification is 145–195 ft. lbs. Make sure the mounting brackets do not move from the marked position on the flat plate. Check/adjust the front end alignment as required.

Lower Control Arms

REMOVAL & INSTALLATION

Aerostar

1. Place the steering and the steering system in the on center position (wheels straight ahead).
2. Raise the vehicle and support it safely under the frame.
3. Remove the coil spring.
4. Remove the bolts and nuts retaining the control arm to the No.1 crossmember. Remove the lower control arm.
5. Install in the reverse order of removal. Final torque is with vehicle in normal ride position. The lower control arm to crossmember torque specification is 100–140 ft. lbs.

Stabilizer Bar

REMOVAL & INSTALLATION

Aerostar

1. Raise and safely support the vehicle. Remove the nuts retaining the stabilizer bar to the lower control arm link.
2. Remove the insulators and disconnect the bar from the links. If required, remove the links from the lower control arm.
3. Remove the bolts retaining the bar mounting bracket to the frame and remove the stabilizer bar.
4. Install in the reverse order of removal procedure.

Bronco II

1. Raise and safely support the vehicle. Remove the bolts and the retainers from the center and the right hand end of the stabilizer bar.
2. Disconnect the stabilizer bar from the stabilizer link.
3. Remove the stabilizer bar and bushings.
4. Installation is the reverse of removal procedure.

Ranger

1. Raise and safely support the vehicle. Remove the nuts and U-bolts re-

taining the lower shock bracket/stabilizer bar bushing to the radius arm.

2. Remove the retainers and remove the stabilizer bar and bushing.
3. Install in the reverse order of removal procedure.

Twin I-Beam Axle

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle. Remove the front wheel spindle, the front spring and the stabilizer bar (if so equipped).
 2. Remove the spring lower seat from the radius arm and then remove the bolt and nut that attaches the stabilizer bar bracket and radius arm to the front axle.
 3. Remove the axle to frame pivot bracket bolt and nut.
- To install:**
4. Position the axle to the frame pivot bracket and install the bolt and nut finger tight.
 5. Position the opposite end of the of the axle to the radius arm, install the attaching bolt from underneath through the bracket, the radius arm and the axle. Install the nut and tighten to 120–150 ft. lbs.
 6. Install the spring lower seat on the radius arm so that the hole in the seat indexes over the arm to axle bolt. Install the front spring.

7. Install the front wheel spindle and stabilizer bar if so equipped.

8. Lower the vehicle (weight on suspension for final torque). Tighten the axle to frame pivot bracket bolts to 120–150 ft. lbs.

Front Wheel Bearings

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle. Remove the wheel/tire assemblies.

2. Remove the brake caliper and wire it to the underbody to prevent damage to the brake hose.

3. Remove the grease cap, cotter pin, retainer adjusting nut and washer.

4. Remove the outer bearing. Pull the hub and rotor off the spindle. Remove and discard the grease seal.

5. Remove the inner bearing from the hub. Remove all traces of old lubricant from the bearings, hub and spindle with solvent and dry thoroughly.

6. Inspect the bearing races for scratches, pits or cracks. If the races are worn or damaged, remove them with a drift. If the inner or outer bearing races were removed, replace them in the hub with the proper tool. The races will be properly seated when they are fully bottomed.

7. Replace the grease retainer. Pack the inside of the hub with lithium base grease, high temperature multi-purpose long life lubricant. Fill the hub until the grease is flush with the inside diameters of both bearing races.

8. Pack the bearings with wheel bearing grease, working as much lubricant as possible between the rollers and the cages.

9. For installation reverse the removal procedure. Adjust the wheel bearings.

ADJUSTMENT

1. Raise the vehicle and support it safely.

2. Remove the wheel cover and the grease cap from the hub. Remove the cotter pin and the locknut. Loosen the adjusting nut 3 turns.

3. Obtain running clearance (running clearance must be maintained throughout adjustment procedure) remove the brake caliper or equivalent. While rotating the wheel, tighten the adjusting nut to 17–25 ft. lbs. to seat the bearings.

4. Back off the adjusting nut ½ turn. Retighten the nut to 18–20 inch lbs. Install the retainer and new cotter pin without additional movement of the adjusting nut.

5. Check the wheel rotation. Reinstall the grease cap and the wheel cover.

REAR SUSPENSION

Shock Absorber

REMOVAL & INSTALLATION

Aerostar

1. Raise and safely support the vehicle.

2. Remove load off shock absorber assembly with jack or equivalent. Remove the shock absorber lower attaching nut and bolt and swing the lower end free of the mounting bracket on the axle housing.

3. Remove the attaching nut from the upper mounting stud and remove the shock absorber.

4. Installation is the reverse of the removal procedure. Torque the upper and lower mounting bolts to 63 ft. lbs.

Bronco II and Ranger

1. Raise and safely support the vehicle.

2. Remove load off shock absorber assembly with jack or equivalent. Remove the self-locking nut, steel washer and rubber bushings if so equipped at the upper and lower ends of the shock absorber. Remove the shock assembly from the vehicle.

3. Installation is the reverse of the removal procedure. Torque the upper mounting bolt to 63 ft. lbs and lower mounting bolt to 73 ft. lbs.

Coil Spring

REMOVAL & INSTALLATION

Aerostar

1. Raise and safely support the vehicle as necessary.

2. Place safety stands or equivalent on the frame rear lift points.

3. Disconnect the shock absorber from the axle mount on the lower control arm and disconnect it from the axle bracket.

4. Lower the rear axle until the coil springs are no longer under compression.

5. Mark and disconnect the lower spring retainer assembly from the control arm. Mark and disconnect the upper spring retainer assembly from the frame.

6. Remove the spring, retainers and insulators from vehicle.

7. Install in the reverse order of removal procedure. The small diameter spring coils face upward with upper pigtail (spring end) resting against the upper insulator rubber stop. Rotate the complete spring assembly until the lower pigtail (spring end) points in a 3 o'clock position. Torque the upper retainer bolt to 40 ft. lbs and lower retainer bolt 65 ft. lbs.

Leaf Spring

REMOVAL & INSTALLATION

Bronco II and Ranger

1. Raise the vehicle frame (safely support) until the weight is off the rear spring, with the tires still touching the floor or equivalent.

2. Remove the nuts from the spring U-bolts and drive the U-bolts from the U-bolt plate.

3. Remove the spring-to-bracket nut and bolt at the front of the spring.

4. Remove the shackle upper and lower nuts and bolts at the rear of the spring. Remove the spring and shackle assembly from the rear shackle bracket.

5. If the bushings in the spring or shackle are worn or damaged, replace them.

To install:

6. Position the spring in the shackle and install the upper shackle-to-spring bolt and nut with the bolt head facing outboard.

7. Position the front end of the spring in the bracket and install. Position the shackle in the rear bracket and install.

8. Position the spring on top of the axle with the spring tie bolt centered in the hole provided in the seat.

9. Install the spring U-bolt plate and nuts. Lower the vehicle. Tighten the spring U-bolt nuts. Tighten the front spring bolt and nut and the rear shackle bolts and nuts.

Rear Upper Control Arm

REMOVAL & INSTALLATION

Aerostar

1. Raise the vehicle and support it safely.

2. Place safety stands or equivalent on the frame rear lift points.

3. Disconnect the shock absorber from the axle mount on the lower control arm and disconnect it from the axle bracket.

Rear suspension-Bronco II and Ranger

Rear suspension-Bronco II and Ranger

Rear lower control arm assembly-Aerostar

4. Lower the rear axle assembly until the coil springs are no longer under compression.

5. Remove the bolt and nut retaining the upper control arm to the rear axle housing. Disconnect the upper control arm from the axle housing. Scribe a mark aligning the position of the cam adjuster in the axle bushing. The cam adjuster controls the rear axle pinion angle for driveline angularity.

6. Remove the bolt and nut retaining the upper control arm to the right frame bracket. Rotate the arm to disengage from the body bracket.

7. Remove the nut and washer retaining the upper control arm to the left frame bracket. Remove the outer insulator and spacer. Remove the control arm from the bracket. Remove the inner insulator from the control arm stud.

To install:

8. Position the inner insulator on the control arm stud. Install the control arm so the stud extends through the left frame bracket. Install the spacer and outer insulator over the stud. Install nut and washer assembly and tighten until snug. Do not torque at this time.

9. Position the upper control arm in the right frame bracket. Install bolt and nut assembly and tighten until snug. Do not torque at this time.

10. Align marks on cam adjuster and axle bushing. Install the upper control arm to axle housing. Install nut and bolt and tighten until snug. Do not torque at this time.

11. Raise the rear axle assembly and install shock absorber assembly. With the axle in the normal ride position tighten control arm to left frame bracket to 60-100 ft. lbs., control arm to right frame bracket to 100-145 ft. lbs. and control arm to center of axle housing to 100-145 ft. lbs.

12. Remove the safety stands and lower the vehicle.

Rear upper control arm assembly-Aerostar

Rear Lower Control Arms

REMOVAL & INSTALLATION

Aerostar

1. Raise and safely support the vehicle. Place safety stands under the frame rear lift points.

2. Disconnect the shock absorber from the axle bracket. Swing the lower end of the shock free of the axle bracket.

3. Lower the rear axle until the coil springs are no longer under compression.

4. Disconnect the lower retainer from the control arm. Remove the insulator from the arm.

5. Remove the bolt and nut retain-

ing the lower control arm to the axle housing.

6. Disconnect the lower control arm from the frame bracket. Remove the lower control arm.

7. Install in the reverse order of removal procedure. With the axle in the normal ride position tighten lower control arm to axle housing to 100-145 ft. lbs. and lower control arm to frame bracket to 100-145 ft. lbs.

VEHICLE IDENTIFICATION CHART

It is important for servicing and ordering parts to be certain of the vehicle and engine identification. The VIN (vehicle identification number) is a 17 digit number visible through the windshield on the driver's side of the dash and contains the vehicle and engine identification codes. The tenth digit indicates model year and the eighth digit indicates engine code. It can be interpreted as follows:

Engine Code						Model Year	
Code	Cu. In.	Liters	Cyl.	Fuel Sys.	Eng. Mfg.	Code	Year
N	262	4.3	6	4bbl.	Chev.	G	1986
Z	262	4.3	6	TBI	Chev.	H	1987
T	292	4.8	6	1bbl.	GM of Mexico	J	1988
F	305	5.0	8	4bbl.	Chev.	K	1989
H (1986)	305	5.0	8	4bbl.	Chev.	L	1990
H (1987-90)	305	5.0	8	TBI	Chev.		
L	350	5.7	8	4bbl.	Chev.		
M	350	5.7	8	4bbl.	Chev.		
K	350	5.7	8	TBI	Chev.		
C	379	6.2	8	Diesel	DDAD		
J	379	6.2	8	Diesel	DDAD		
W	454	7.4	8	4bbl.	Chev.		
N	454	7.4	8	TBI	Chev.		

DDAD—Detroit Diesel Allison Division

- ① Short bed—16 gal.
Long bed—20 gal.
Dual tanks—16 gal. each tank, above 8600 GUWR; 20 gal. each
- ② 8½ in. ring gear—4.2 pts.
9½ in. ring gear—6.5 pts.
9¾ in. ring gear—6.0 pts.
10½ in. ring gear—6.5 pts.
- ③ Front axle—2 qts., transfer case—5 qts.
④ Front axle—3 qts., transfer case—2½ qts.
- ⑤ 3 speed—3.2 pts.
4 speed—4.2 pts.
- ⑥ 350c—6.3 pts.
400—9.0 pts.
700-R4—10.0 pts.
- ⑦ Standard—25 gals.
Optional—31 gals. & 40 gals.
- ⑧ Standard—27 gals.
Optional—32 gals. & 41 gals.
- ⑨ Standard—25 gals.
Optional—31 gals.

- ⑩ Standard—27 gals.
Optional—32 gals.
- ⑪ Standard—22 gals.
Optional—33 gals.
- ⑫ Standard—26 gals.
Deluxe tank (long bed)—34 gals.
- ⑬ Front axle—1.75 qts., transfer case—1.4 qts.
⑭ Front axle—2.2 qts., transfer case—2.75 qts.
- ⑮ 117 mm—8.4 pts.
85 mm—3.6 pts.
- ⑯ 400/475—9 pts.
700-R4—10 pts.
- ⑰ 8½ in. ring gear—4.2 pts.
9½ in. ring gear—5.5 pts.
9¾–10½ in. (DANA) ring gear—5.5 pts.
10½ in. (Chevrolet) ring gear—7.2 pts.
- ⑱ Standard—31 gals.
Optional—40 gals.
- ⑲ Standard—32 gals.
Optional—41 gals.
- ⑳ With rear heater—20 qts.

① Left front bolt 85 ft. lbs.

② 1st step 20 ft. lbs.

2nd step 50 ft. lbs.

3rd ¼ turn ft. lbs.

③ Inner bolts 110 ft. lbs.

Outer bolts 100 ft. lbs.

④ 2, 3, 4 bolts 70 ft. lbs.

Other bolts 80 ft. lbs.

⑤ Intake manifold to exhaust manifold—
44 ft. lbs.

Manifold to cylinder head—38 ft. lbs.

⑥ Cast manifold—two center bolts—26
ft. lbs., all others 20 ft. lbs.

Tubular stainless steel—26 ft. lbs.

⑦ Two center bolts—26 ft. lbs., all
others—20 ft. lbs.

① Caster/camber adjustment kit must be installed to make adjustments

② If ride height is 2¹/₂, caster should be 3⁵/₈

If ride height is 3, caster should be 3¹/₈

If ride height is 3¹/₂, caster should be 2⁵/₈

If ride height is 3³/₄, caster should be 2³/₈

If ride height is 4, caster should be 2

③ If ride height is 2¹/₂ to 4, caster should be 8

④ If ride height is 2¹/₂, caster should be 1¹/₂

If ride height is 3, caster should be 1⁵/₁₆

If ride height is 3¹/₂, caster should be 5¹/₁₆

If ride height is 3³/₄, caster should be 1¹/₈

If ride height is 4, caster should be 0

⑤ If ride height is 1¹/₂, caster should be 3³/₈

If ride height is 2, caster should be 3

If ride height is 2¹/₂, caster should be 2¹/₁₆

If ride height is 3, caster should be 2⁵/₁₆

If ride height is 3¹/₂, caster should be 2

If ride height is 3³/₄, caster should be 1¹³/₁₆

If ride height is 4, caster should be 1¹/₁₆

⑥ If ride height is 2¹/₂, caster should be 3⁵/₈

If ride height is 3, caster should be 3¹/₈

If ride height is 3¹/₂, caster should be 2⁵/₈

If ride height is 3³/₄, caster should be 2³/₈

If ride height is 4, caster should be 2¹/₈

ENGINE ELECTRICAL

NOTE: Disconnecting the negative battery cable on some vehicles may interfere with the functions of the on board computer systems and may require the computer to undergo a relearning process, once the negative battery cable is reconnected.

Distributor

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove all necessary components in order to gain access to the distributor assembly.

3. Disconnect the distributor electrical connectors. If equipped, disconnect the vacuum line. Mark and remove the spark plug wires.

4. Remove the distributor cap. Position the engine at TDC. Matchmark the rotor and the distributor body. Matchmark the distributor assembly and the engine block.

5. Remove the distributor retaining bolt. Carefully remove the distributor from the vehicle.

NOTE: As the distributor is removed from the engine, the rotor will turn counterclockwise. Observe and mark the start and finish rotation of the rotor. When reinstalling, position the rotor at the last mark and set the distributor into the engine. As the distributor drops into place, the rotor should turn to its original position, providing the engine crankshaft had not been rotated with the distributor out.

6. Installation is the reverse of the removal procedure.

Ignition Timing

Connect the timing light per manufacturers instructions to the engine. Be sure to time the engine on No.1 cylinder. Connect the tachometer to the engine per manufacturers instructions. If the vehicle is equipped with a diesel engine, a special timing light and a digital tachometer must be used. Some engines incorporate a bracket and hole which are cast into the timing case cover for the use of a magnetic timing

probe, which is connected to a special electronic timing meter for precise ignition timing. If using this type of timing equipment, be sure to follow the manufacturers instructions.

ADJUSTMENT

Except Magnetic Timing

1. Locate the timing marks on the crankshaft pulley and the front of the timing case cover.

2. Clean off the timing marks.

3. Use chalk or white paint to color the mark on the scale that will indicate the correct timing, when aligned with the mark on the pulley or the pointer.

4. Attach a tachometer to the engine. Attach a timing light to the engine.

5. On some engines, it is necessary to disconnect the EST connector to set the timing. See the underhood sticker for details.

6. Disconnect and plug the vacuum lines to the distributor, if equipped. Loosen the distributor lockbolt just enough so that the distributor can be turned with a little resistance.

7. Adjust the idle to the correct specification.

8. With the timing light aimed at the pulley and the marks on the en-

gine, turn the distributor in the direction of rotor rotation to retard the spark, and in the opposite direction of rotor rotation to advance the spark. Align the marks on the pulley and the engine with the flashes of the timing light.

Magnetic Timing

A bracket and hole are cast into the timing case cover for the use of a magnetic timing probe, which is connected to a special electronic timing meter for precise ignition timing. The probe is inserted into the hole of the bracket until the vibration damper is touched. When the engine is started, the probe is automatically spaced away from the damper by the dampers eccentricity, or being slightly out of center. The probe senses a milled slot on the damper and compensating for the brackets top dead center position, registers the reading on the timing meter. Any necessary corrections can then be made to the ignition timing. Do not use the probe bracket and hole to check the ignition timing when using a conventional timing light.

Alternator

For further information on the charging system, please refer to "Charging and Starting" in the Unit Repair section.

BELT TENSION ADJUSTMENT

V-Belt

1. Place a belt tension gauge at the center of the greatest span of a warm not hot drive belt and measure the tension.

2. If the belt is below the specification, loosen the component mounting bracket and adjust to specification.

3. Run the engine at idle for 15 minutes to allow the belt to reseal itself in the pulleys.

4. Allow the drive belt to cool and re-measure the tension. Adjust as necessary to meet the following specifications:

a. On the 4.3L, 5.0L, 5.7L, 7.4L engines—old belt-90 ft. lbs. (400 N), new belt-135 ft. lbs.(600 N).

b. On the 4.8L engine—old belt-90 ft. lbs. (400 N), new belt-169 ft. lbs.(750 N).

c. On the 6.2L diesel engine—old belt-67 ft. lbs. (300 N), new belt-146 ft. lbs.(650 N).

Serpentine Belts

Serpentine belts use an automatic tensioner which is spring activated and

can be turned to the left or the right to apply or release the pulley tension.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Disconnect the electrical connectors at the alternator.

2. Remove the necessary components in order to gain access to the alternator assembly.

3. Remove the alternator belt. Remove the alternator retaining bolts. Remove the alternator from the vehicle.

4. Installation is the reverse of the removal procedure. Adjust the alternator belt, as required.

Starter

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. As required, raise and support the vehicle safely.

2. Remove the flywheel cover. Remove the exhaust crossover pipe, as required.

3. Disconnect the electrical wiring harness and battery leads at solenoid terminals.

4. Remove the starter mounting bolts and retaining nuts. Remove the starter assembly from the vehicle.

5. Installation is the reverse of the removal procedure. Install any shims that were removed with the starter.

Diesel Glow Plugs

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Disconnect the electrical connection at the glow plug.

3. Using a suitable tool remove the glow plug.

Diesel engine glow plug location

4. Installation is the reverse of removal. Torque the glow plugs to 12 ft. lbs.

TESTING

Inhibit Switch

Check the temperature controlled switch to make sure it is closed at low temperatures and open at high temperatures.

1. Remove the connector from the inhibit switch when the engine temperature is below 100°F.

2. Set the ohmmeter on a low range or use a self powered test lamp.

3. Test across the terminals. The switch should be closed (test lamp on or a reading of less than 0.1 ohm on the meter).

4. Test terminals to ground with a test lamp or the ohmmeter on a high range. The lamp should be off or the meter show greater than 1.0 megaohm.

Flywheel to starter pinion clearance during starter installation

Electronic glow plug system

5. Replace the switch if it test open across the terminals or if either terminal is closed to the ground.

6. Disconnect the plug from the switch terminals when the engine is above 125 degrees F.

7. Set the ohmmeter on the highest scale or use a self powered test lamp and test across the terminals. Test across each terminal to ground.

8. The switch should be open (test lamp off or high ohm reading of greater than 1 megohm on the meter).

9. Replace the switch if it is closed. Use a socket wrench when installing the switch and torque to 17 ft. lbs.

Controller

The glow plug controller provides glow plug operation after starting a cold engine.

1. With the engine cold 80 °F, turn the engine control switch to the **RUN** position and let the glow plugs cycle.

2. After 2 minutes crank the engine for 1 second. (It is not important that the engine starts.) Return the engine control switch to **RUN**. The glow plugs should cycle at least once after cranking.

3. If the the plugs do not turn on, disconnect the controller connector and check terminal B with a grounded 12 volt test lamp. The lamp should be off with the engine control switch in **RUN**, and on when the engine is cranked.

4. If the lamp does not operate as described, repair a short or open in the engine harness purple wire.

5. If the lamp works right but the afterstart glow plug feature does not, replace the controller.

Glow plug controller

CHASSIS ELECTRICAL

Heater Blower Motor

REMOVAL & INSTALLATION

Without Air Conditioning

EXCEPT VAN

1. Disconnect the negative battery terminal.

2. Mark the position of the blower motor in relation to its case.

3. Remove the electrical connection at the motor.

4. Remove the blower attaching screws and remove the assembly. Pry gently on the flange if the sealer sticks.

5. The blower wheel can be removed from the motor shaft by removing the nut at the center.

6. Installation is the reverse of removal. Apply a bead of sealer to the mounting flange before installation.

Van

1. Disconnect the negative battery cable.

2. Remove the coolant overflow bottle.

3. Unplug the motor wiring.

4. Remove the attaching screws and lift out the blower motor.

5. Installation is the reverse of removal.

With Air Conditioning

1986 C/K SERIES AND 1987-90 R/V SERIES

1. Disconnect the negative battery terminal.

2. Remove the attaching bolts and nuts and on the diesel engine, remove the insulating shield from the case.

3. Mark the position of the blower motor in relation to its case.

4. Remove the electrical connection at the motor.

5. Disconnect the blower motor cooling tube.

6. Remove the blower attaching screws and remove the assembly. Pry gently on the flange if the sealer sticks.

7. The blower wheel can be removed from the motor shaft by removing the nut at the center.

8. Installation is the reverse of removal. Apply a bead of sealer to the mounting flange before installation.

1988-90 C/K SERIES

1. Disconnect the negative battery terminal.

2. Remove the electrical connection at the motor.

3. Remove the blower attaching screws and remove the assembly. Pry gently on the flange if the sealer sticks.

4. The blower wheel can be removed from the motor shaft by removing the nut at the center.

5. Installation is the reverse of removal. Apply a bead of sealer to the mounting flange before installation.

1986-89 VAN

1. Disconnect the negative battery cable.

2. Remove the power antenna, if so equipped.

3. Remove the coolant overflow bottle.

4. Unplug the motor wiring.

5. Remove the attaching screws and lift out the blower motor.

6. Installation is the reverse of removal.

1990 VAN

1. Disconnect the negative battery terminal.

2. Remove the coolant overflow bottle.

3. Unplug the motor wiring.

4. Remove the attaching screws and lift out the blower motor.

5. Installation is the reverse of removal.

Windshield Wiper Motor

REMOVAL & INSTALLATION

1986 C/K Series and 1987-90 R/V Series

1. Make sure the wipers are parked.

2. Disconnect the ground cable from the battery.

3. Disconnect the wiring harness at the wiper motor and the hoses from the washer pump.

4. Reach down through the access hole in the plenum and loosen the wiper drive rod attaching screws. Remove the drive rod from the wiper motor crank arm.

5. Remove the wiper motor attaching screws and the motor assembly and linkage.

6. To install, reverse the removal procedure.

NOTE: Lubricate the wiper motor crank arm pivot before reinstallation. Failure of the washers to operate or to shut off is often caused by grease or dirt on the electromagnetic contacts. Simply unplug the wire and pull off the plastic cover for access. Likewise, failure of the wipers to park is often caused by grease or dirt on the park switch contacts. The park switch is under the cover behind the pump.

1988-90 C/K Series

1. Disconnect the battery ground cable.

2. Pivot the wiper arm away from the windshield, move the latch to the open position and lift the wiper arm off of the driveshaft.

3. Remove the cowl vent grille.

4. Unplug the wiring from the motor.

5. Remove the drive link-to-crank arm screws and slide the links from the arm.

6. Remove the motor mounting bolts and lift the motor out.

7. Installation is the reverse of removal.

Van

1. Make sure the wipers are parked. The wiper arms should be in their normal OFF position.

2. Open the hood and disconnect the battery ground cable.

3. Remove the exposed cowl cover screws with the hood up.

Air conditioning blower motor installation—1988-90 C/K Series

4. Remove the wiper arms. This can be done by pulling the wiper arms away from the glass to release the clip underneath. The wiper arms are splined to the shafts and can be pulled off.

5. Remove the remaining screws securing the cowl panel and remove it.

6. Loosen the nuts holding the transmission linkage to the wiper motor crank arm.

7. Disconnect the power feed to the wiper arm at the connector next to the radio.

8. Remove the flex hose from the left defroster outlet to gain access to the wiper motor screws.

9. Remove the screw holding the left hand heater duct to the engine shroud and move the heater duct down and out.

10. Remove the windshield washer hoses from the pump.

11. Remove the 3 screws holding the wiper motor to the cowl and lift the wiper motor out from under the dash.

To install:

12. Position the wiper motor in the park position.

13. Position the wiper motor under the dash.

14. Install the 3 screws holding the wiper motor to the cowl.

15. Install the windshield washer hoses at the pump.

16. Install the screw holding the left hand heater duct to the engine.

17. Install the flex hose at the left defroster outlet.

18. Connect the power feed to the wiper arm at the connector next to the radio.

19. Tighten the nuts holding the transmission linkage to the wiper motor crank arm.

20. Install the cowl panel.

21. Install the wiper arms.

22. Install the cowl cover screws.

23. Connect the battery ground cable.

24. Be sure that the wiper motor arm is in the parked position. The wiper arms should be in their normal OFF position.

Wiper motor mounting—1986 C/K Series and 1987-90 R/V Series

1. Screw
2. Wiper motor
3. Nut
4. Bracket

Wiper motor mounting—1988-90 C/K Series

Windshield Wiper Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Remove the steering wheel. Remove the turn signal switch.

2. It may be necessary to loosen the 2 column mounting nuts and remove the 4 bracket to mast jacket screws, then separate the bracket from the mast jacket to allow the connector clip

Wiper motor mounting — 1986-90 Van

on the ignition switch to be pulled out of the column assembly.

3. Disconnect the washer/wiper switch lower connector.

4. Remove the screws attaching the column housing to the mast jacket. Be sure to note the position of the dimmer switch actuator rod for reassembly in the same position. Remove the column housing and switch as an assembly.

NOTE: Some tilt columns have a removable plastic cover on the column housing. This provides access to the wiper switch without removing the entire column housing.

5. Turn the assembly upside down and use a drift to remove the pivot pin from the washer/wiper switch. Remove the switch.

6. Place the switch into position in the housing, then install the pivot pin.

7. Position the housing onto the mast jacket and attach by installing the screws. Install the dimmer switch actuator rod in the same position as noted earlier. Check switch operation.

8. Reconnect lower end of switch assembly.

9. Install remaining components in reverse order of removal. Be sure to attach column mounting bracket in original position.

Instrument Cluster

REMOVAL & INSTALLATION

1986 C/K Series and 1987-90 R/V Series

1. Disconnect the battery ground cable.

2. Remove the headlamp switch control knob.

3. Remove the radio control knobs.
4. Remove the steering column cover 4 retaining screws.

5. Remove 8 screws and remove instrument bezel.

6. Reach under the dash, depress the speedometer cable tang, and remove the cable.

7. Pull instrument cluster out just far enough to disconnect all lines and wires.

8. Remove the cluster.

9. Installation is the reverse of removal.

1988-90 C/K Series

1. Disconnect the battery ground cable.

2. Remove the radio control head.

3. Remove the heater control panel.

4. Momentarily ground the cluster assembly by jumping from the metal retaining plate to a good ground.

Exploded view of the cluster assembly — 1986 C/K Series and 1987-90 R/V Series

Exploded view of the cluster assembly — 1988-90 C/K Series

5. On vehicles with automatic transmission, remove the cluster trim plate.

6. Remove the 4 cluster retaining screws.

7. Carefully pull the cluster towards you until you can reach the electrical connector. Unplug the connector. Avoid touching the connector pins.

8. Installation is the reverse of removal.

Van

1. Disconnect the battery ground cable.

2. Reach up behind the cluster, depress the speedometer cable retaining tang and pull out the cable.

3. Remove the clock set stem knob.

4. Remove the cluster bezel retaining screws.

5. Remove the cluster bezel.

6. Remove the 2 lower cluster retaining screws.

7. Pull the top of the cluster away from the panel and lift out the bottom of the cluster. Pull the cluster out just far enough to unplug the wiring and remove the cluster.

8. Installation is the reverse of removal.

Exploded view of the cluster assembly — 1986-90 Van

Speedometer

REMOVAL & INSTALLATION

1986 C/K Series and 1987-90 R/V Series

1. Disconnect the negative battery cable.
2. Remove the headlamp switch knob assembly.
3. Remove the radio control knobs.
4. Remove the clock adjuster stem.
5. Remove the instrument cluster bezel.
6. Remove the steering column cover.
7. Remove the instrument cluster lens.
8. Remove the transmission shift indicator.
9. Remove the cluster retainer.
10. Depress the spring clip and disconnect the speedometer cable.
11. Remove the speedometer.
12. Installation is the reverse of removal.

1988-90 C/K Series

1. Disconnect the negative battery cable.
2. Remove the cluster.
3. Remove the speedometer mounting screws.
4. Carefully pull the speedometer from the circuit board. Avoid touching any of the circuit board pins.
5. Installation is the reverse of removal.

Van

1. Disconnect the negative battery cable.
2. Remove the cluster.
3. Remove the speedometer dial retaining screws.
4. Remove the 2 hex head screws and rubber grommets that hold the speedometer assembly to the cluster cover.
5. Disconnect the speedometer cable from the speedometer and remove the speedometer.
6. Installation is the reverse of removal.

Radio

REMOVAL & INSTALLATION

NOTE: Make certain that the speaker is attached to the radio before the unit is turned ON. If it is not, the output transistors will be damaged.

1986 C/K Series and 1987-90 R/V Series

1. Disconnect the negative battery cable.

2. Remove the control knobs and the bezels from the radio control shafts.

3. Remove the nuts from the support shafts.

4. Remove the support bracket retaining screws.

5. Lifting the rear edge of the radio, push the radio forward until the control shafts clear the instrument panel then lower the radio far enough so that the electrical connections can be disconnected.

6. Remove the power lead, speaker, and antenna wires and then pull out the unit.

7. Installation is the reverse of removal.

1988-90 C/K Series

RECEIVER

1. Disconnect the negative battery cable.

2. Working behind the instrument panel, disconnect the wiring and antenna from the receiver.

3. Remove the receiver bracket screws.

4. Remove the receiver and bracket from the dash.

5. Remove the receiver-to-bracket nuts.

6. Installation is the reverse of removal. Torque the nuts to 14 ft. lbs.

TAPE PLAYER

1. Disconnect the negative battery cable.

2. Remove the control knobs and trim plate.

3. Remove the tape player-to-instrument panel screws.

4. Pull the unit towards you just far enough to disconnect the wiring. Then, remove the unit.

5. Installation is the reverse of removal.

RADIO/TAPE PLAYER CONTROL HEAD

1. Disconnect the negative battery cable.

2. Remove the instrument cluster trim and bezel.

3. Remove the mounting screws.

4. Pull the unit towards you just far enough to disconnect the wiring. Then, remove the unit.

5. Installation is the reverse of removal.

Van

1. Disconnect the negative battery cable.

2. Disconnect the ground cable from the battery.

3. Remove the engine cover.

4. Remove the air cleaner.

5. Cover the carburetor or throttle body with a clean rag.

6. Remove the knobs, washers and nuts from the front of the radio.

7. Remove the rear bracket screw and bracket from the radio.

8. Remove the radio through the engine access area. Lower the radio far enough to detach the wiring.

9. Remove the radio.

10. Installation is the reverse of removal.

HeadLight Switch

REMOVAL & INSTALLATION

1986 C/K Series and 1987-90 R/V Series

1. Disconnect the negative battery cable.

2. Reaching up behind instrument cluster, depress shaft retaining button and remove switch knob and rod.

3. Remove instrument cluster bezel screws on left end. Pull out on bezel and hold switch nut with a wrench.

4. Disconnect multiple wiring connectors at switch terminals.

5. Remove switch by rotating while holding switch nut.

6. Installation is the reverse of removal.

1988-90 C/K Series

1. Disconnect the negative battery cable.

2. Remove the instrument cluster bezel.

3. Remove the headlamp switch retaining screws.

1. Instrument panel cluster bezel
2. Headlamp switch
3. Screw

Headlamp switch installation — 1988-90 C/K Series

4. Pull the switch away from the bezel.

5. Installation is the reverse of removal.

Van

1. Disconnect the negative battery cable.

2. Remove the left instrument panel trim plate.

3. Remove the retaining nut securing the switch.

4. Disconnect the electrical connector from the back of the switch.

5. The switch can now be removed.

6. Reverse the procedure for installation.

Dimmer Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Remove the steering wheel. Remove the turn signal switch and position it out of the way.

2. It may be necessary to loosen the 2 column mounting nuts and remove the 4 bracket to mast jacket screws, then separate the bracket from the mast jacket to allow the connector clip on the ignition switch to be pulled out of the column assembly.

3. Disconnect the switch lower connector.

4. Remove the screws attaching the column housing to the mast jacket. Be

sure to note the position of the dimmer switch actuator rod for reassembly in the same position. Remove the column housing and switch as an assembly.

NOTE: The tilt and travel columns have a removable plastic cover on the column housing. This provides access to the switch without removing the entire column housing.

5. Turn the assembly upside down and use a drift to remove the pivot pin from the switch. Remove the switch.

6. Place the switch into position in the housing, then install the pivot pin.

7. Position the housing onto the mast jacket and attach by installing the screws. Install the dimmer switch actuator rod as required. Check switch operation.

8. Reconnect lower end of switch assembly.

9. Install remaining components in reverse order of removal. Be sure to attach column mounting bracket in original position.

Turn Signal Switch

REMOVAL & INSTALLATION

Standard Steering Column

1. Disconnect the negative battery cable.

2. Remove the steering wheel.

3. Insert a suitable tool into the lockplate and remove the lockplate cover assembly.

4. Install a spring compressor onto the steering shaft. Tighten the tool to compress the lockplate and the spring. Remove the snapping from the groove in the shaft.

5. Remove the lockplate and slide the turn signal cam and the upper bearing preload spring and the thrust washer off the upper steering shaft.

6. Remove the steering column lower cover.

7. Remove the turn signal lever from the column.

8. On vehicles equipped with cruise control, disconnect the cruise control wire from the harness near the bottom of the column. Remove the harness protector from the cruise control wire. Remove the turn signal lever. Do not remove the wire from the column.

9. Remove the vertical bolts at the steering column upper support. Remove the shim packs. Keep the shims in order for reinstallation.

10. Remove the screws securing the column upper mounting bracket to the column. Remove the bracket.

11. Disconnect the turn signal wiring and remove the wires from the plastic protector.

12. Remove the turn signal switch mounting screws.

13. Slide the switch connector out of the bracket on the steering column.

14. If the switch is known to be bad, cut the wires and discard the switch. Before cutting the wires, verify that the wire codes are the same. Tape the connector of the new switch to the old wires, and pull the new harness down through the steering column while removing the old wires.

15. If the original switch is to be reused, wrap tape around the wire and connector and pull the harness up through the column. It may be helpful to attach a length of wire to the harness connector before pulling it up through the column to facilitate installation.

16. After freeing the switch wiring protector from its mounting, pull the turn signal switch straight up and remove the switch, switch harness, and the connector from the column.

17. Installation is the reverse of the removal procedure.

Tilt Steering Column

1. Disconnect the negative battery cable. Remove the steering wheel.

2. Remove the rubber sleeve bumper from the steering shaft.

3. Remove the plastic retainer and disengage the tabs on the retainer from the C-ring.

4. Compress the upper steering

Turn signal switch location—except 1988-90 C/K Series with tilt wheel

Turn signal switch location—1988-90 C/K Series with tilt wheel

shaft preload spring with a spring compressor and remove the C-ring. When installing the spring compressor, pull the upper shaft up about one inch and turn the ignition to the **LOCK** position to hold the shaft in place.

5. Remove the spring compressor and remove the upper steering shaft lockplate, horn contact carrier and the preload spring.

6. Remove the steering column lower cover. Unscrew and remove the turn signal lever.

7. If equipped with cruise control, disconnect the cruise control wire from the harness near the bottom of

Removing the lock plate retaining ring

the steering column. Slide the protector off the cruise control wire. Remove the lever attaching screw and carefully pull the lever out enough to allow the removal of the turn signal switch.

8. Remove the nuts and shim packs from the upper column support. Keep the shims together as a unit for reinstallation.

9. Remove the bracket from the steering column by removing the two attaching screws from each side.

10. Disconnect the turn signal wiring harness and remove the wires from the plastic protector.

11. Remove the turn signal switch retaining screws and pull the switch up out of the steering column.

12. If the switch is to be replaced, cut the wires from the switch and tape the new switch connector to the old wires. Verify that the wire codes are the same, before cutting the wires. Carefully pull the new harness down through the column as the old wires are removed.

13. If the old switch is to be reused, tape the connector to the wires and carefully pull the harness up out of the column.

14. Feed the wiring harness down through the steering column to replace the old switch.

15. Secure the switch in the steering column.

16. Install the upper shaft preload spring.

17. Install the lockplate and carrier assembly. Make sure that the flat on the lower end of the steering shaft is pointing up and that the small plastic tab on the carrier is up or nearest the top of the column. The flat surface of the lockplate must be installed facing down against the turn signal switch.

18. Install the spring compressor, compress the preload spring and lockplate and install the C-ring with the wide side toward the keyway.

19. Remove the spring compressor and install the plastic retainer on the C-ring.

Removing the lock plate

20. Install the rubber sleeve bumper over the steering shaft and install the steering wheel.

21. Install the turn signal lever. If the vehicle is equipped with cruise control, secure the lever to the switch with the retaining screw and install the wiring harness.

22. Remove the tape from the end of the harness and connect the switch and cruise control, if so equipped, to the wire harness.

23. Cover both harnesses with the plastic protector and position it to the column. The turn signal connector slides on the tabs of the column.

24. Position the steering column upper bracket over the turn signal switch harness plastic protector.

25. Install the mounting bracket nuts and shims in their original positions.

26. Install the steering column lower cover.

Ignition Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. If equipped, remove the lower trim panel.

2. Remove the steering column retaining bolts. Lower the steering column assembly to gain access to the switch retaining screws. Extreme care is necessary to prevent damage to the collapsible column.

3. Make sure the switch is in the **LOCK** position. If the lock cylinder is out, pull the switch rod up to the stop, then go down 1 detent.

4. Remove the electrical connections from the switch. Remove the switch retaining screws. Remove the switch from the column.

5. Installation is the reverse of the removal procedure. Before installation, make sure the switch is in the **LOCK** position. Install the switch using the original screws. Use of screws that are too long could prevent the column from collapsing on impact.

Ignition Lock Cylinder

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the steering wheel.

3. Remove the turn signal switch. It is not necessary to completely remove the switch from the column. Pull the switch rearward far enough to slip it over the end of the shaft, but do not pull the harness out of the column.

4. Turn the lock to **RUN**.

5. Remove the lock retaining screw and remove the lock cylinder.

SWITCH IN LOCK POSITION

Ignition switch shown in the **LOCK** position for removal

NOTE: If the retaining screw is dropped on removal, it may fall into the column, requiring complete disassembly of the column to retrieve the screw.

6. To install, rotate the key to the stop while holding onto the cylinder.

7. Push the lock all the way in.

8. Install the screw. Tighten the screw to 40 inch lbs. for regular columns, 22 inch lbs. for adjustable columns.

9. Install the turn signal switch and the steering wheel.

Stoplight Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Disconnect the switch electrical connections. Remove the switch assembly from its mounting.

Stoplamp switch adjustment lever — 1988-90 C/K Series

3. Installation is the reverse of the removal procedure. Adjust the switch, as required.

ADJUSTMENT

Except 1988-90 C/K Series

1. Depress the brake pedal and press the switch in until it is firmly seated in its mounting.

2. Pull the brake pedal against the pedal stop until the switch does not make any noise.

3. Electrical contact should be made when the brake pedal is depressed from its fully released position.

1988-90 C/K Series

1. Depress the brake pedal fully.

2. Pull the lever on the brake switch back to its stop.

3. Pull the brake pedal back to its stop position.

Fuses and Circuit Breakers

LOCATION

Fusible Links

In addition to circuit breakers and fuses, the wiring harness incorporates fusible links to protect the wiring. Links are used rather than a fuse, in wiring circuits that are not normally fused, such as the ignition circuit. Fusible links are color coded red in the charging and load circuits to match the color of the circuits they protect. Each link is four gauges smaller than the cable it protects, and is marked on the insulation with the gauge size because the insulation makes it appear heavier than it really is.

The engine compartment wiring harness has several fusible links. The same size wire with a special hypalon insulation must be used when replacing a fusible link. The links are located in the following areas:

1. A molded splice at the starter solenoid BAT terminal, a 14 gauge red wire.

2. A 16 gauge red fusible link at the junction block to protect the unfused wiring of 12 gauge or larger wire. This link stops at the bulkhead connector.

3. The alternator warning light and field circuitry is protected by a 20 gauge red wire fusible link used in the battery feed to voltage regular No. 1 terminal. The link is installed as a molded splice in the circuit at the junction block.

4. The ammeter circuit is protected by two 20 gauge fusible links installed as molded splices in the circuit at the

Ignition lock cylinder removal and installation

junction block and battery to starter circuit.

Circuit Breakers

A circuit breaker is an electrical switch which breaks the circuit in case of an overload. All models have a circuit breaker in the headlight switch to protect the headlight and parking light systems. An overload may cause the lamps to flicker or flash on and off, or in some cases, to remain off. Windshield wiper motors are protected by a circuit breaker at the motor.

Fuses and Flashers

Fuses are located in the junction box below the instrument panel to the left of the steering column. The turn signal flasher and the hazard/warning flasher also plug into the fuse block. Each fuse receptacle is marked as to the circuit it protects and the correct amperage of the fuse. Inline fuses are also used on the underhood lamp and air conditioning.

NOTE: A special heavy duty turn signal flasher is required to properly operate the turn signals when a trailer's lights are connected to the system.

ENGINE COOLING

Radiator

REMOVAL & INSTALLATION

Except 6.2L Diesel Engine

1. Disconnect the negative battery cable.
2. Drain the cooling system.
3. Disconnect the radiator upper and lower hoses and, if applicable, the transmission coolant lines. Remove the coolant recovery system line, if so equipped.
4. Remove the radiator upper panel if so equipped.
5. If there is a radiator shroud in front of the radiator, the radiator and shroud are removed as an assembly.
6. If there is a fan shroud, remove the shroud attaching screws and let the shroud hang on the fan.
7. Remove the radiator attaching bolts and remove the radiator.
8. Installation is the reverse of the removal procedure.

6.2L Diesel Engine

1. Disconnect the negative battery cables.

2. Drain the cooling system.
 3. Remove the air intake snorkel.
 4. Remove the windshield washer bottle.
 5. Remove the hood release cable.
 6. Remove the upper fan shroud.
 7. Disconnect the upper radiator hose.
 8. Disconnect the transmission cooler lines.
 9. Disconnect the low coolant sensor wire.
 10. Disconnect the overflow hose.
 11. Disconnect the engine oil cooler lines.
 12. Disconnect the lower radiator hose.
 13. On the Van, remove the brake master cylinder from the booster.
 14. Unbolt and remove the radiator.
- To install:**
15. Install the radiator.
 16. On the Van, install the brake master cylinder on the booster.
 17. Connect the lower radiator hose.
 18. Connect the engine oil cooler lines.
 19. Connect the overflow hose.
 20. Connect the low coolant sensor wire.
 21. Connect the transmission cooler lines.
 22. Connect the upper radiator hose.
 23. Install the upper fan shroud.
 24. Install the hood release cable.
 25. Install the windshield washer bottle.
 26. Install the air intake snorkel.
 27. Fill the cooling system.

Auxiliary Electric Cooling Fan

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the grille.
3. Unplug the fan harness connector.
4. Remove the fan-to-brace bolts and lift out the fan.
5. Installation is the reverse of removal. Torque the bolts to 53 ft. lbs.

Heater Core

REMOVAL & INSTALLATION

Without Air Conditioning

1986 C/K SERIES AND 1987-90 R/V SERIES

1. Disconnect the battery ground cable.
2. Disconnect the heater hoses at the core tubes and drain the engine coolant. Plug the core tubes to prevent spillage.

3. Remove the nuts from the distributor air ducts in the engine compartment.

4. Remove the glove compartment and door.

5. Disconnect the air-defrost and temperature door cables.

6. Remove the floor outlet and remove the defroster duct-to-heater distributor screw.

7. Remove the heater distributor-to-instrument panel screws. Pull the assembly rearward to gain access to the wiring harness and disconnect the wires attached to the unit.

8. Remove the heater distributor from the vehicle.

9. Remove the heater core retaining straps and remove the core from the vehicle.

10. Installation is the reverse of removal. Be sure that the core-to-core and case-to-dash panel sealer is intact. Fill the cooling system and check for leaks.

1988-90 C/K SERIES

1. Disconnect the battery ground cable.

2. Remove the coolant overflow bottle.

3. Drain the cooling system.

4. Disconnect the heater hoses at the core tubes.

5. In the engine compartment, remove the heater case-to-firewall screws.

6. Disconnect the antenna cable at the mast.

7. Remove the glove box.

8. Disconnect the wiring harness at the engine's Electronic Control Module (ECM).

9. Remove the ECM and bracket.

10. Remove the right side kick panel.

11. Remove the right side lower dash panel bolt and nut.

12. Remove the heater case mounting bolts.

13. While lifting the instrument panel slightly, remove the case assembly.

14. Lift the core from the case.

To install:

15. Lower the core into the case.

16. Position the case assembly against the firewall.

17. Install the heater case mounting bolts.

18. Install the right side lower dash panel bolt and nut.

19. Install the right side kick panel.

20. Install the ECM and bracket.

21. Connect the ECM wiring harness.

22. Install the glove box.

23. Connect the antenna cable at the mast.

24. Install the heater case-to-firewall screws.

25. Connect the heater hoses at the core tubes.

26. Fill the cooling system.
27. Install the coolant overflow bottle.
28. Connect the battery ground cable.

1986-90 VAN

1. Disconnect the negative battery cable.
 2. Remove the coolant recovery bottle.
 3. Place a pan under the Van and disconnect the heater intake and outlet hoses. Quickly remove and plug the hoses and support them in an upright position. Drain the coolant from the heater core into the pan.
 4. Remove the heater distributor duct-to-case attaching screws and the duct-to-engine cover screw. Remove the duct.
 5. Remove the engine cover.
 6. Remove all the instrument panel attaching screws.
 7. Carefully lower the steering column. Raise and support the right side of the instrument panel.
 8. Remove the defroster duct-to-case attaching screws and the 2 screws attaching the distributor to the heater case.
 9. Disconnect the temperature door cable. Carefully fold the cable back and out of the way.
 10. Remove the 3 nuts from the engine compartment side of the distributor case and the screw from the passenger compartment side.
 11. Remove the heater case and core assembly.
 12. Remove the core retaining straps and remove the core.
- To install:**
13. Install the core.
 14. Install the core retaining straps.
 15. Install the heater case and core assembly.
 16. Install the 3 nuts on the engine compartment side of the distributor case and the screw on the passenger compartment side.
 17. Connect the temperature door cable.
 18. Install the defroster duct-to-case attaching screws and the 2 screws attaching the distributor to the heater case.
 19. Install the steering column.
 20. Install all the instrument panel attaching screws.
 21. Install the engine cover.
 22. Install the duct. Install the heater distributor duct-to-case attaching screws and the duct-to-engine cover screw.
 23. Connect the heater intake and outlet hoses.
 24. Fill the cooling system.
 25. Install the coolant recovery bottle.

26. Connect the negative battery cable.

With Air Conditioning

1986 C/K SERIES AND 1987-90 R/V SERIES

1. Disconnect the battery ground cable.
2. Disconnect the heater hoses at the core tubes and drain the engine coolant. Plug the core tubes to prevent spillage.
3. Remove the glove compartment and door.
4. Disconnect the center duct from the defroster outlet duct.
5. Disconnect the center, lower air distributor and the center air outlet ducts.
6. Disconnect the temperature door cable.
7. Remove the nuts from the 3 selector duct studs that project into the engine compartment.
8. Remove the outlet duct-to-instrument panel screws. Pull the assembly rearward to gain access to the wiring harness and disconnect the wires and vacuum tubes attached to the unit.
9. Remove the heater distributor from vehicle vehicle.
10. Remove the heater core retaining straps and remove the core from the case.
11. Installation is the reverse of removal. Be sure that the core-to-core and case-to-dash panel sealer is intact. Fill the cooling system and check for leaks.

1988-90 C/K SERIES

1. Disconnect the battery ground cable.
 2. Drain the cooling system.
 3. Discharge the system.
 4. Remove the coolant overflow tank.
 5. Disconnect the heater hoses at the core tubes.
 6. Disconnect and cap the refrigerant lines at the evaporator.
 7. Unplug the electrical connector at the temperature actuator.
 8. Remove the 7 attaching screws and remove the heater case bottom plate.
 9. Remove the screws and brackets that hold the heater core to the case and lift the core from the case.
- To install:**
10. Install the heater core in the case.
 11. Install the heater case bottom plate.
 12. Connect the electrical connector at the temperature actuator.
 13. Connect the refrigerant lines at the evaporator. Always use a back-up wrench. Use new O-rings coated with

clean refrigerant oil. Tighten the inlet line to 30 ft. lbs.; the outlet line to 18 ft. lbs.

14. Connect the heater hoses at the core tubes.

15. Install the coolant overflow tank.
16. Evacuate and charge the system.
17. Fill the cooling system.
18. Connect the battery ground cable.

1986-90 VAN

1. Disconnect the battery ground cable.
 2. Remove the engine cover.
 3. Remove the steering column to instrument panel bolts. Lower the column carefully.
 4. Remove the upper and lower instrument panel attaching screws. Remove the radio support bracket screw.
 5. Raise and support the right side of the instrument panel.
 6. Remove the lower right instrument panel bracket.
 7. Remove the vacuum actuator from the kick panel.
 8. Disconnect the temperature cable and vacuum hoses at the case. Remove the heater distributor duct from over the engine hump.
 9. Remove the 2 defroster duct to firewall attaching screws below the windshield.
 10. Under the hood, disconnect and plug the heater hoses at the firewall.
 11. Remove the three nuts and one screw (inside) holding the heater case to the firewall.
 12. Remove the case from the vehicle. Remove the gasket for access to the screws holding the case together. Remove the temperature cable support bracket. Remove the screws and separate the case. Remove the heater core.
- To install:**
13. Install the heater core.
 14. Install the screws and separate the case.
 15. Install the temperature cable support bracket.
 16. Install the gasket.
 17. Install the case in the vehicle.
 18. Install the three nuts and one screw (inside) holding the heater case to the firewall.
 19. Connect and plug the heater hoses at the firewall.
 20. Install the two defroster duct-to-firewall attaching screws below the windshield.
 21. Install the heater distributor duct.
 22. Connect the temperature cable and vacuum hoses at the case.
 23. Install the vacuum actuator at the kick panel.
 24. Install the lower right instrument panel bracket.

25. Install the radio support bracket screw.
26. Install the upper and lower instrument panel attaching screws.
27. Install the steering column to instrument panel bolts.
28. Install the engine cover.
29. Connect the battery ground cable.
30. Refill the cooling system as necessary.

Water Pump

REMOVAL & INSTALLATION

Except 6.2L Diesel Engine

1. Disconnect the negative battery cable.
2. Drain the radiator.
3. Loosen the alternator and other accessories at their adjusting points, and remove the fan belts from the fan pulley.
4. Remove the fan and pulley.
5. Remove any accessory brackets that might interfere with water pump removal.
6. Disconnect the hose from the water pump inlet and the heater hose from the nipple on the pump. Remove the bolts, pump assembly and old gasket from the timing chain cover.
7. Check the pump shaft bearings for endplay or roughness in operation. Water pump bearings usually emit a squealing sound with the engine running when the bearings need to be replaced. Replace the pump if the bearings are not in good shape or have been noisy.

To install:

8. Make sure the gasket surfaces on the pump and timing chain cover are clean.
9. Install the pump assembly with a new gasket. On all except the 4.8 L engine, tighten the bolts to 30 ft. lbs. On the 4.8 L engine, tighten the bolts to 15 ft. lbs.
10. Connect the hose between the water pump inlet and the nipple on the pump.
11. Install any accessory brackets.
12. Install the fan and pulley.
13. Install and adjust the alternator and other accessories.
14. Install the fan belts from the fan pulley.
15. Fill the cooling system.
16. Connect the battery.

6.2L Diesel Engine

1. Disconnect the negative battery cables.
2. Remove the fan and fan shroud.
3. Drain the radiator.
4. If the vehicle is equipped with air

conditioning, remove the air conditioning hose bracket nuts.

5. Remove the oil filler tube.
6. Remove the alternator pivot bolt and remove the generator belt.
7. Remove the alternator lower bracket.
8. Remove the power steering belt and secure it out of the way.
9. Remove the air conditioning belt if equipped.
10. Disconnect the bypass hose and the lower radiator hose.
11. Remove the water pump bolts. Remove the water pump plate and gasket and water pump. If the pump gasket is to be replaced, remove the plate attaching bolts to the water pump and remove (and replace) the gasket.

To install:

12. When installing the pump, the flanges must be free of oil. Apply an anaerobic sealer (GM part No. 1052357 or equivalent).

NOTE: The sealer must be wet to the touch when the bolts are torqued.

13. Attach the water pump and plate assembly. Torque the bolts to 35 ft. lbs.
14. Connect the bypass hose and the lower radiator hose.
15. Install the air conditioning belt if equipped.
16. Install the power steering belt.
17. Install the alternator lower bracket.
18. Install the alternator pivot bolt.
19. Install the alternator belt.
20. Install the oil filler tube.
21. If the vehicle is equipped with air conditioning, install the air conditioning hose bracket nuts.
22. Fill the radiator.
23. Install the fan and fan shroud.
24. Connect the batteries.

Thermostat

REMOVAL & INSTALLATION

Except 6.2L Diesel Engine

1. Disconnect the negative battery cable.
2. Drain the radiator until the level is below the thermostat level (below the level of the intake manifold).
3. Remove the water outlet elbow assembly from the engine. Remove the thermostat from inside the elbow.
4. Install new thermostat in the reverse order of removal, making sure the spring side is inserted into the elbow. Clean the gasket surfaces on the water outlet elbow and the intake manifold. Use a new gasket when installing the elbow to the manifold. On the 4.8L engine, torque the thermo-

stat housing bolts to 28 ft. lbs. and on all other engines to 20 ft. lbs.

5. Refill the cooling system.

6.2L Diesel Engine

1. Disconnect the negative battery cables.
2. Remove the upper fan shroud.
3. Drain the cooling system to a point below the thermostat.
4. Remove the engine oil dipstick tube brace and the oil fill brace.
5. Remove the upper radiator hose.
6. Remove the water outlet.
7. Remove the thermostat and gasket.
8. Installation is the reverse of removal. Use a new gasket coated with sealer. Make sure that the spring end of the thermostat is in the engine. Torque the bolts to 35 ft. lbs.

GASOLINE FUEL SYSTEM

Fuel System Service Precaution

When working with the fuel system certain precautions should be taken; always work in a well ventilated area, keep a dry chemical (Class B) fire extinguisher near the work area. Always disconnect the negative battery cable and do not make any repairs to the fuel system until all the necessary steps for repair have been reviewed.

RELIEVING FUEL SYSTEM PRESSURE

The 220 TBI unit used on the V6 and V8 engines has a constant bleed in the pressure regulator to relieve pressure any time the engine is turned off, however a small amount of fuel may be released when the fuel line is disconnected. As a precaution, cover the fuel line with a cloth and dispose of properly. Also, loosen the fuel filler cap to relieve tank vapor pressure.

Fuel Filter

REMOVAL & Installation

Carbureted Engine

FILTER IN CARBURETOR

1. Disconnect the negative battery cable.
2. Disconnect the fuel line connecting at the intake fuel filter nut. Plug the opening to prevent loss of fuel.

3. Remove the intake fuel filter nut from the carburetor.

4. Remove the filter element and spring.

5. Check the element for restrictions by blowing on the cone end. Air should pass freely.

6. Clean or replace the element, as necessary.

7. Install the element spring, then the filter element in the carburetor. Bronze filters should have the small section of the cone facing out.

8. Install a new gasket on the intake fuel nut. Install the nut in the carburetor body and tighten securely.

9. Install the fuel line and tighten the connector.

INLINE FILTER

Some vehicles may have an inline filter. This is a can shaped device located in the fuel line between the pump and the carburetor. It may be made of either plastic or metal. To replace the filter:

1. Disconnect the negative battery cable.

2. Place some absorbent rags under the filter.

3. Use a pair of pliers to expand the clamp on one end of the filter, then slide the clamp down past the point to which the filter pipe extends in the rubber hose. Do the same with the other clamp.

4. Gently twist and pull the hoses free of the filter pipes. Remove and discard the old filter.

NOTE: Most replacement filters come with new hoses that should be installed with a new filter.

5. Install the new filter into the hoses, slide the clamps back into place, and check for leaks with the engine idling.

Fuel Injected Engine

The inline filter is found along the frame rail.

1. Disconnect the negative battery cable.

2. Release the fuel system pressure.

3. Raise and support the vehicle safely.

4. Disconnect the fuel lines.

5. Remove the fuel filter from the retainer or mounting bolt.

6. To install, reverse the removal procedures. Start the engine and check for leaks.

NOTE: The filter has an arrow (fuel flow direction) on the side of the case, be sure to install it correctly in the system, the with arrow facing away from the fuel tank.

Mechanical Fuel Pump

TESTING

Fuel pumps should always be tested on the vehicle. The larger line between the pump and tank is the suction side of the system and the smaller line, between the pump and carburetor, is the pressure side. A leak in the pressure side would be apparent because of dripping fuel. A leak in the suction side is usually only apparent because of a reduced volume of fuel delivered to the pressure side.

1. Tighten any loose line connections and look for any kinks or restrictions.

2. Disconnect the fuel line at the carburetor. Disconnect the distributor-to-coil primary wire. Place a container at the end of the fuel line and crank the engine a few revolutions. If little or no fuel flows from the line, either the fuel pump is inoperative or the line is plugged. Blow through the lines with compressed air and try the test again. Reconnect the line.

3. If fuel flows in good volume, check the fuel pump pressure to be sure.

4. Attach a pressure gauge to the pressure side of the fuel line. On vehicles equipped with a vapor return system, squeeze off the return hose.

5. Run the engine at idle and note the reading on the gauge. Stop the engine and compare the reading to the specification. If the pump is operating properly, the pressure will be as specified and will be constant at idle speed. If pressure varies sporadically or is too high or low, the pump should be replaced.

6. Remove the pressure gauge.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Disconnect the fuel intake and outlet lines at the pump and plug the pump intake line.

3. You can remove the upper bolt from the right front engine mounting boss (on the front of the block) and insert a long bolt ($\frac{3}{8}$ in. - 16 $\times$ 2 in.) to hold the fuel pump pushrod.

4. Remove the 2 pump mounting bolts and lockwashers; remove the pump and its gasket.

5. If the rocker arm pushrod is to be removed, remove the 2 adapter bolts and lockwashers and remove the adapter and its gasket.

6. Install the fuel pump with a new gasket reversing the removal procedure. Heavy grease can be used to hold

the fuel pump pushrod up when installing the pump, if you didn't install the long bolt in Step 2. Coat the mating surfaces with sealer.

7. Connect the fuel lines and check for leaks.

Electric Fuel Pump

TESTING

1. Secure 2 sections of $\frac{3}{8}$ in. $\times$ 10 in. (steel tubing), with a double-flare on 1 end of each section.

2. Install a flare nut on each section of tubing, then connect each of the sections into the flare nut-to-flare nut adapter, while care included in the gauge adapter tool J-29658-82.

3. Attach the pipe and the adapter assembly to the gauge tool J-29658.

4. Raise and support the vehicle safely.

5. Remove the air cleaner and plug the THERMAC vacuum port on the TBI.

6. Disconnect the fuel feed hose between the fuel tank and the filter, then secure the other ends of the $\frac{3}{8}$ in. tubing into the fuel hoses with hose clamps.

7. Start the engine, check for leaks and observe the fuel pressure, it should be 9-13 psi.

8. Depressurize the fuel system, remove the testing tool, remove the plug from the THERMAC vacuum port, reconnect the fuel line, start the engine and check for fuel leaks.

REMOVAL & INSTALLATION

1. With the engine turned off, relieve the fuel pressure at the pressure regulator.

2. Disconnect the negative battery cable.

3. Raise and support the rear of the vehicle safely.

4. Drain the fuel tank, then remove it.

5. Using a hammer and a drift punch, drive the fuel lever sending device and pump assembly locking ring (located on top of the fuel tank) counterclockwise, lift the assembly from the tank and remove the pump from the fuel lever sending device.

6. Pull the pump up into the attaching hose while pulling it outward away from the bottom support. Be careful not to damage the rubber insulator and strainer during removal. After the pump assembly is clear of the bottom support, pull it out of the rubber connector.

7. To install, reverse the removal procedures.

Carburetor

REMOVAL & INSTALLATION

1. Disconnect the negative battery terminal. Remove the air cleaner assembly and gasket.

2. Disconnect the electrical connectors from the choke and idle stop solenoid.

3. Disconnect and tag the vacuum hoses.

4. Disconnect the accelerator linkage, downshift cable and cruise control linkage, if so equipped.

5. Disconnect and plug the fuel line connection at the fuel inlet nut.

6. Remove the carburetor attaching bolts and the carburetor with the flange insulator.

7. Install the carburetor with a new flange gasket. It is good shop practice to fill the carburetor float bowl before installing the carburetor. This reduces the strain on starting motor and battery and reduces the possibility of backfiring while attempting to start the engine. Operate the throttle several times and check the discharge from pump jets before installing the carburetor.

8. Install the carburetor attaching bolts and torque them to 12 ft. lbs. (16 Nm). Be sure to torque the bolts in a criss-cross pattern.

9. Install the fuel line to the fuel inlet nut, cruise control cable, if so equipped, downshift cable, accelerator linkage, vacuum hoses, electrical connectors to the choke and idle stop solenoid, air cleaner assembly with gasket and the negative battery terminal.

NOTE: After servicing the carburetor, tighten the mounting bolts in a clockwise direction to 12 ft. lbs. (16 Nm). When tightening the carburetor at recommended maintenance intervals, check the bolt torque. If less than 5 ft. lbs. (7 Nm), retighten to 8 ft. lbs. (11 Nm); but if greater than 5 ft. lbs. (7 Nm), do not retighten.

IDLE SPEED AND MIXTURE ADJUSTMENT

In case of a major carburetor overhaul, throttle body replacement, or high idle CO (when indicated by an emissions inspection), the idle mixture may be adjusted. Adjusting the mixture by other than the following method may violate Federal and/or state laws. Idle mixture needle socket J-29030-B or equivalent is required for this adjustment.

1. Set the parking brake and block the drive wheels.

2. Remove the carburetor from the engine.

3. Drain the fuel from the the carburetor into a container. Dispose of the fuel in an approved container.

4. Remove the idle mixture needle plugs as follows:

a. Invert the carburetor and support it to avoid damaging external components.

b. Make 2 parallel hacksaw cuts in the throttle body, between the locator points near one idle mixture needle plug. The distance between the cuts depends on the size of the punch to be used.

c. Cut down to the plug, but not more than 1/8 in. beyond the locator point.

d. Place a flat punch at a point near the ends of the saw marks. Hold the punch at a 45° angle and drive it into the throttle body until the casting breaks away, exposing the steel plug.

e. Use a center punch to break the plug apart, uncover idle mixture needle. Remove all loose pieces of plug.

f. Repeat the previous steps for the other needle plug.

5. Use idle mixture needle socket J-29030-B or equivalent to lightly seat the idle mixture needles, then back them out 3 turns.

6. Reinstall the carburetor on the engine.

7. Place the transmission in P (automatic transmission) or neutral (manual transmission).

8. Start the engine and bring it to a normal operating temperature, choke valve open, and air conditioning off.

9. Connect a known accurate tachometer to the engine.

10. Check ignition timing, and adjust if necessary, by following the procedure described on the emission control information label located under the hood on the vehicle.

11. Use idle mixture needle socket J-29030-B or equivalent to turn the mixture needles equally (1/8 turn at a time), in or out, to obtain the highest rpm (best idle).

12. Adjust the idle speed screw (throttle stop) to obtain the base idle speed specified on the underhood emission control information label.

13. Again try to readjust mixture needles to obtain the highest idle rpm. The adjustment is correct when the highest rpm (best idle) is reached with the minimum number of mixture needle turns from the seated position.

14. If necessary, readjust the idle speed screw (throttle stop) to obtain the specified base idle speed.

15. Check and if necessary, adjust the idle speed solenoid activated speed

and fast idle speed. Refer to the underhood emission control information label.

16. Check the throttle kicker and adjust if necessary.

17. Turn off the engine, remove all test equipment and remove the block from the drive wheels.

SERVICE ADJUSTMENTS

For all carburetor service adjustment procedures and specifications, please refer to "Carburetor Service" in the Unit Repair section

Fuel Injection

IDLE SPEED ADJUSTMENT

Only if parts of the throttle body have been replaced should this procedure be performed; the engine should be at operating temperature.

1. Remove the air cleaner, adapter and gaskets. Discard the gaskets. Plug any vacuum line ports, as necessary.

2. Leave the idle air control (IAC) valve connected and ground the diagnostic terminal (ALDL connector).

3. Turn the ignition switch to the ON position, do not start the engine. Wait for at least 30 seconds (this allows the IAC valve pintle to extend and seat in the throttle body).

4. With the ignition switch still in the ON position, disconnect IAC electrical connector.

5. Remove the ground from the diagnostic terminal and start the engine. Let the engine reach normal operating temperature.

6. Apply the parking brake and block the drive wheels. Remove the plug from the idle stop screw by piercing it first with a suitable tool, then applying leverage to the tool to lift the plug out.

7. With the engine in the drive position adjust the idle stop screw to obtain the following specifications:

500-550 rpm in D on models equipped with automatic transmissions.

600-650 rpm in neutral on models equipped with manual transmissions.

8. Turn the ignition off and reconnect the IAC valve connector. Unplug any plugged vacuum line ports and install the air cleaner, adapter and new gaskets.

Fuel Injector

REMOVAL & INSTALLATION

NOTE: When removing the injectors, be careful not to damage

the electrical connector pins (on top of the injector), the injector fuel filter and the nozzle. The fuel injector is serviced as a complete assembly only. The injector is an electrical component and should not be immersed in any kind of cleaner.

1. Disconnect the negative battery cable.

2. Remove the air cleaner. Relieve the fuel pressure.

3. At the injector connector, squeeze the 2 tabs together and pull straight up.

4. Remove the fuel meter cover and leave the cover gasket in place.

5. Using a small pry bar or tool No. J-26868, carefully lift the injector until it is free from the fuel meter body.

6. Remove the small O-ring from the nozzle end of the injector. Carefully rotate the injector's fuel filter back and forth to remove it from the base of the injector.

7. Discard the fuel meter cover gasket.

8. Remove the large O-ring and back-up washer from the top of the counterbore of the fuel meter body injector cavity.

9. To install, lubricate the O-rings with automatic transmission fluid and reverse the removal procedures.

Removing the fuel injector on the TBI 220

DIESEL FUEL SYSTEM

Fuel Filter

REMOVAL & Installation

1. Drain the fuel from the fuel filter by opening both the air bleed and the water drain valve allowing the fuel to drain out into an appropriate container.

2. Remove the fuel tank cap to release any pressure or vacuum in the tank.

3. Unstrap both bail wires with a suitable tool and remove the filter.

4. Before installing the new filter, insure that both filter mounting plate fittings are clear of dirt.

5. Install the new filter, snap into place with the bail wires.

6. Close the water drain valve and open the air bleed valve. Connect a 1/8 in. (3mm) I.D. hose to the air bleed port and place the other end into a suitable container.

7. Disconnect the fuel injection pump shut off solenoid wire.

8. Crank the engine for 10-15 seconds, then wait 1 minute for the starter motor to cool. Repeat until clear fuel is observed coming from the air bleed.

NOTE: If the engine is to be cranked, or starting attempted with the air cleaner removed, care must be taken to prevent dirt from being pulled into the air inlet manifold which could result in engine damage.

9. Close the air bleed valve, reconnect the injection pump solenoid wire and replace the fuel tank cap.

10. Start the engine, allow it to idle for 5 minutes and check the fuel filter for leaks.

Removing the fuel injector on the TBI 220

Replacing the fuel meter cover on the TBI 220

1. Water drain valve
2. Bail wires
3. Fuel meter element
4. Air bleed
5. Filter adapter

6. Air bleed port
7. Restriction switch
8. Fuel heater
9. Water sensor

Diesel engine fuel filter

DRAINING WATER FROM THE SYSTEM

Water is the worst enemy of the diesel fuel injection system. The injection pump, which is designed and constructed to extremely close tolerances, and the injectors can be easily damaged if enough water is forced through them in the fuel. Engine performance will also be drastically affected, and engine damage can occur.

Diesel fuel is much more susceptible than gasoline to water contamination. Diesel engine vehicles are equipped with an indicator lamp system that turns on an instrument panel lamp if water (1-2½ gallons) is detected in the fuel tank. The lamp will come on for 2-5 seconds each time the ignition is turned on, assuring the driver the lamp is working. If there is water in the fuel, the light will come back on after a 15 to 20 second off delay, and then remain on.

PURGING THE FUEL TANK

The 6.2L diesel engines also use a water-in-fuel warning system. The fuel tank is equipped with a filter which screens out the water and lets it lay in the bottom of the tank below the fuel pickup. When the water level reaches a point where it could be drawn into the system, a warning light flashes in the cab. A built-in siphoning system starting at the fuel tank and going to the rear spring hanger on some models, and at the midway point of the right frame rail on other models permits you to attach a hose at the shut-off and siphon out the water.

If it becomes necessary to drain water from the fuel tank, also check the primary fuel filter for water.

DRAINING THE FUEL TANK

NOTE: Disconnect the battery before beginning the draining operation.

If the vehicle is not equipped with a drain plug, use the following procedure to remove the fuel.

1. Using a 10 ft. (305cm) piece of ¾ in. (9.525mm) hose cut a flap slit 18 in. (457mm) from one end.
2. Install a pipe nipple, of slightly larger diameter than the hose, into the opposite end of the hose.
3. Install the nipple end of the hose into the fuel tank with the natural curve of the hose pointing downward. Keep feeding the hose in until the nipple hits the bottom of the tank.
4. Place the other end of the hose in a suitable container and insert a air hose pointing it in the downward di-

rection of the slit and inject air into the line.

NOTE: If the vehicle is to be stored, always drain the fuel from the complete fuel system including, fuel pump supply, fuel injection pump, fuel lines, and tank.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Drain the tank.
3. Raise and support the vehicle safely.
4. Remove the clamp on the filler neck and the vent tube hose.
5. Remove the gauge hose which is attached to the frame.
6. While supporting the tank securely, remove the support straps.
7. Lower the tank until the gauge wiring can be removed.
8. Remove the tank.
9. Install the unit by reversing the removal procedure. Make certain that the anti-squeak material is replaced during installation.
10. Lower the vehicle.

Diesel Injection Pump

REMOVAL & INSTALLATION

1. Disconnect both batteries.
2. Remove the fan and fan shroud.
3. Remove the intake manifold.
4. Remove the fuel lines.
5. Disconnect the alternator cable at the injection pump, and the detent cable where applicable.
6. Tag and disconnect the necessary wires and hoses at the injection pump.
7. Disconnect the fuel return line at the top of the injection pump.
8. Disconnect the fuel feed line at the injection pump.
9. Remove the air conditioning hose retainer bracket if equipped with A/C.
10. Remove the oil fill tube, includ-

ing the crankcase depression valve vent hose assembly.

11. Remove the grommet.
12. Scribe or paint a matchmark on the front cover and on the injection pump flange.
13. The crankshaft must be rotated in order to gain access to the injection pump drive gear bolts through the oil filler neck hole.
14. Remove the injection pump-to-front cover attaching nuts. Remove the pump and cap all open lines and nozzles.

To install:

15. Replace the gasket. This is important.
16. Align the locating pin on the pump hub with the slot in the injection pump driven gear. At the same time, align the timing marks.
17. Attach the injection pump to the front cover, aligning the timing marks before torquing the nuts to 30 ft. lbs.
18. Install the drive gear to injection pump bolts, torquing the bolts to 20 ft. lbs.
19. Install the remaining components in the reverse order of removal. Torque the fuel feed line at the injection pump to 20 ft. lbs. Start the engine and check for leaks.

Injection Pump Fuel Lines

REMOVAL & INSTALLATION

NOTE: When the fuel lines are to be removed, clean all fuel line fittings thoroughly before loosening. Immediately cap the lines, nozzles and pump fittings to maintain cleanliness.

1. Disconnect both batteries.
2. Disconnect the air cleaner bracket at the valve cover.
3. Remove the crankcase ventilator bracket and move it aside.

Diesel Injection pump mounting

Diesel injection pump locating pin

4. Disconnect the secondary filter lines.

5. Remove the secondary filter adapter.

6. Loosen the vacuum pump hold-down clamp and rotate the pump in order to gain access to the intake manifold bolt. Remove the intake manifold bolts. The injection line clips are retained by the same bolts.

7. Remove the intake manifold. Install a protective cover so no foreign material falls into the engine.

8. Remove the injection line clips at the loom brackets.

9. Remove the injection lines at the nozzles and cover the nozzles with protective caps.

10. Remove the injection lines at the pump and tag the lines for later installation.

11. Remove the fuel line from the injection pump.

12. Install all components in the reverse order of removal.

Idle Speed Adjustment

NOTE: A special tachometer suitable for diesel engines must be used. A gasoline engine type tach will not work with the diesel engine.

1. Set the parking brake and block the drive wheels.

2. Run the engine up to normal operating temperature. The air cleaner must be mounted and all accessories turned off.

3. Install the diesel tachometer as per the manufacturer's instructions.

4. Adjust the low idle speed screw on the fuel injection pump to 650 rpm in neutral for manual transmission equipped vehicles or P for automatic transmission equipped vehicles.

NOTE: All idle speeds are to be set within 25 rpm of the specified values.

5. Adjust the fast idle speed as follows:

a. Remove the connector from the fast idle solenoid. Use an insulated jumper wire from the battery

positive terminal to the solenoid terminal to energize the solenoid.

b. Open the throttle momentarily to ensure that the fast idle solenoid plunger is energized and fully extended.

c. Adjust the extended plunger by turning the hex-head screw to an engine speed of 800 rpm in neutral.

d. Remove the jumper wire and reinstall the connector to the fast idle solenoid.

6. Disconnect and remove the tachometer.

Injection Timing

ADJUSTMENT

For the engine to be properly timed, the lines on the top of the injection pump adapter and the flange of the injection pump must be aligned.

1. The engine must be off for resetting the timing.

2. Loosen the 3 pump retaining nuts with tool J-26987, an injection pump intake manifold wrench, or its equivalent.

Injection nozzle

3. Align the mark on the injection pump with the marks on the adapter and tighten the nuts. Torque to 35 ft. lbs. Use a 3/4 in. open-end wrench on the boss at the front of the injection pump to aid in rotating the pump to align the marks.

4. Adjust the throttle rod.

Fuel Injector

REMOVAL & INSTALLATION

1. Disconnect both batteries.
2. Disconnect the fuel line clip, and remove the fuel return hose.

3. Remove the fuel injection line.

4. Using GM special tool J-29873, remove the injector. Always remove the injector by turning the 30mm hex portion of the injector; turning the

Diesel injection timing alignment marks

Injection nozzles

Diesel injection pump idle adjustment locations

round portion will damage the injector. Always cap the injector and fuel lines when disconnected, to prevent contamination.

5. Install the injector with new gasket and torque to 50 ft. lbs. Connect the injection line and torque the nut to 20 ft. lbs. Install the fuel return hose, fuel line clips, and connect the batteries.

EMISSION CONTROLS

Please refer to "Emission Control" in the Unit Repair section for system maintenance procedures. Due to the complex nature of modern electronic engine control systems, comprehensive diagnosis and testing procedures fall outside the confines of this repair manual. For complete information on diagnosis, testing and repair procedures concerning all modern engine and emission control systems, please refer to "Chilton's Guide to Electronic Engine Controls".

Emission Warning Lamps

RESETTING

When the ECM sets a code, the **Service Engine Soon** light will come ON and a code will be stored in memory. If the problem is intermittent, the light will go out after 10 seconds when the fault goes away. However the code will stay in the memory for 50 starts or until the battery voltage to the ECM is removed. Removing battery voltage for 30 seconds will clear all stored codes. On 1988-90 vehicles, the ECM B fuse can also be used to clear codes on all vehicles except the C/K series which has a fuse link.

NOTE: To prevent damage to the ECM, the key must be OFF when disconnecting or connecting power to the ECM.

GASOLINE ENGINE MECHANICAL

NOTE: Disconnecting the negative battery cable on some vehicles may interfere with the functions of the on board computer systems and may require the computer to undergo a relearning process, once the negative battery cable is reconnected.

Engine

REMOVAL & INSTALLATION

1986 C/K Series and 1987-90 R/V Series

4.8L ENGINE

1. Disconnect the negative battery cable. Remove the battery, as required. Matchmark and remove the hood. Drain the cooling system.

2. Disconnect the accelerator cable from the carburetor throttle lever. As required, remove the detent cable from the throttle lever.

3. Remove air cleaner assembly. Disconnect all necessary electrical wiring from the engine. Disconnect all necessary vacuum hoses from the engine.

4. Remove the radiator hoses from the radiator. Remove the heater hoses from the engine. Remove the radiator. Remove the fan assembly and water pump pulley.

5. Properly relieve the fuel pump pressure. Disconnect and plug the fuel line at the fuel pump.

6. Raise the vehicle and support it safely. Drain the engine oil. Remove the starter. Remove the flywheel cover. Disconnect the exhaust pipe from the exhaust manifold.

7. Properly support the engine and remove the engine mount through bolts. If equipped with an automatic transmission, remove the flex plate bolts. If equipped with 4WD, remove the strut rods at the engine mounts. Remove the bell housing to engine retaining bolts.

8. Properly support the transmission assembly. Using the proper lifting device, carefully remove the engine from the vehicle.

9. Installation is the reverse of the removal procedure.

4.3L, 5.0L, 5.7L AND 7.4L ENGINES

1. Matchmark and remove the hood. Disconnect the negative battery cable. As required, remove the battery. Drain the cooling system.

2. Remove the air cleaner assembly. Remove the fan assembly and the water pump pulley.

3. Disconnect the upper and lower radiator hoses at the engine. Disconnect the heater hoses at the engine. If equipped with automatic transmission, disconnect and plug the cooler lines at the radiator. Remove the radiator and shroud assembly.

4. Disconnect the accelerator linkage. As required, disconnect the detent cable. If equipped with air conditioning, remove the compressor and position it aside.

5. If equipped with power steering, remove the pump from the engine and position it aside. Remove the engine wiring harness from the engine components.

6. Properly relieve the fuel line pressure. Disconnect the fuel line at the engine. Disconnect all necessary vacuum lines.

7. Raise the vehicle and support it safely. Drain the engine oil. Disconnect the exhaust pipe from the exhaust manifold.

8. On 4WD vehicles equipped with automatic transmission, remove the strut rods from the engine mounts. Remove the flywheel cover.

9. Disconnect the wiring along the right pan rail and the gas gauge wire. Remove the starter. If equipped with automatic transmission, remove the converter to flex plate attaching bolts.

10. Properly support the transmission. Remove the bell housing to engine bolts, leaving 1 or more loose to support the weight of the assembly. Remove the lower engine mount bracket to frame bolts. Lower the vehicle.

11. Attach a lifting device to the engine, remove the remaining bell housing bolts. Carefully remove the engine from the vehicle.

12. Installation is the reverse of the removal procedure.

1988-90 C/K Series

4.3L, 5.0L AND 5.7L ENGINES

1. Disconnect the negative battery cable.

2. Remove the hood.

3. Drain the cooling system.

4. Remove the air cleaner.

5. Remove the accessory drive belt, fan and water pump pulley.

6. Remove the radiator and shroud.

7. Disconnect the heater hoses at the engine.

8. Disconnect the accelerator, cruise control and detent linkage if used.

9. Disconnect the air conditioning compressor, if used, and lay aside.

10. Remove the power steering pump, if used, and lay aside.

11. Disconnect the engine wiring from the engine.

12. Release the fuel system pressure as required. Disconnect the fuel line.

13. Disconnect the vacuum lines from the intake manifold.

14. Raise the vehicle and support it safely.

15. Drain the engine oil.

16. Disconnect the exhaust pipes from the manifold.

17. Disconnect the strut rods at the engine mountings, if used.

18. Remove the flywheel or torque converter cover.

19. Disconnect the wiring along the oil pan rail.

20. Remove the starter.

21. Disconnect the wire for the fuel gauge.

22. On vehicles equipped with automatic transmission, remove the converter to flex plate bolts.

23. Lower the vehicle and suitably support the transmission. Attach a suitable lifting fixture to the engine.

24. Remove the bell housing to engine bolts.

25. Remove the rear engine mounting to frame bolts and the front through bolts and remove the engine.

To install:

26. Raise the vehicle and support it safely.

27. Lower the engine and install the engine mounting bolts. Torque the rear engine mounting to frame bolts or nuts to 45 ft. lbs., the front through bolts to 70 ft. lbs. and the front nuts to 50 ft. lbs.

28. Install the bell housing to engine bolts and torque to 35 ft. lbs.

29. Install the converter to flex bolts and torque to 35 ft. lbs.

30. Install the fuel gauge wiring and starter.

31. Install the flywheel or torque converter cover.

32. Connect the strut rods at the engine mountings, if used.

33. Install the exhaust pipes at the manifold.

34. Lower the vehicle.

35. Connect the vacuum lines to the intake manifold.

36. Install the fuel line.

37. Connect the engine wiring harness.

38. Install the power steering pump, if used.

39. Connect the air conditioning compressor, if used.

40. Connect the accelerator, cruise control and detent linkage.

41. Connect the heater hoses.

42. Install the radiator and shroud.

43. Install the accessory drive belts.

44. Install the hood.

45. Install the proper quantity and grade of coolant and engine oil.

46. Connect the negative battery cable.

7.4L ENGINE

1. Remove the hood.

2. Disconnect the negative battery cable.

3. Remove the air cleaner.

4. Remove the radiator and fan shroud.

5. Disconnect and tag all necessary engine wiring.

6. Disconnect the accelerator, cruise control and TVS linkage.

7. Properly relieve the fuel system

pressure as required and disconnect the fuel supply lines.

8. Disconnect all necessary vacuum wires.

9. Disconnect the air conditioning compressor, if used, and lay aside.

10. Remove the power steering pump, if used, and lay aside.

11. Raise the vehicle and support it safely.

12. Disconnect the exhaust pipes from the manifold.

13. Remove the starter.

14. Remove the flywheel or torque converter cover.

15. On vehicles equipped with automatic transmission, remove the converter to flex plate bolts.

16. Lower the vehicle and suitably support the transmission. Attach a suitable lifting fixture to the engine.

17. Remove the bell housing to engine bolts.

18. Remove the rear engine mounting to frame bolts and the front through bolts and remove the engine.

To install:

19. Lower the engine and install the engine mounting bolts. Torque the rear engine mounting to frame bolts or nuts to 45 ft. lbs., the front through bolts to 70 ft. lbs. and the front nuts to 50 ft. lbs.

20. Install the bell housing to engine bolts and torque to 35 ft. lbs.

21. Remove the engine lifting fixture and transmission jack.

22. Raise the vehicle and support it safely.

23. Install the converter to flex bolts and torque to 35 ft. lbs.

24. Install the fuel gauge wiring and starter.

25. Install the flywheel or torque converter cover.

26. Install the starter.

27. Install the exhaust pipes at the manifold.

28. Lower the vehicle.

29. Install the power steering pump.

30. Install the air conditioning compressor.

31. Install all vacuum hoses.

32. Install the fuel supply line.

33. Connect the accelerator, cruise control and TVS linkage.

34. Connect the engine wiring.

35. Install the radiator and fan shroud.

36. Install the air cleaner.

37. Install the hood.

38. Connect the negative battery cable.

39. Install the proper quantity and grade of coolant.

Van

4.3L ENGINE

1. Disconnect the battery cables.

2. Remove the glove box.

3. Drain the cooling system.

4. Remove the engine cover.

5. Remove the outside air duct.

6. Remove the power steering reservoir.

7. Remove the hood release cable.

8. Remove the upper fan shroud bolts.

9. Remove the fan and pulley.

10. Remove the air cleaner.

11. Remove the cruise control servo, servo bracket and transducer.

12. Tag and disconnect all vacuum hoses.

13. Disconnect the accelerator linkage and TVS cables.

14. Properly relieve the fuel system pressure and remove the TBI unit.

15. Remove the distributor cap.

16. Disconnect the heater hoses at the engine.

17. Remove the PCV valve.

18. Discharge the air conditioning system using the proper equipment and remove the airconditioning vacuum reservoir.

19. Remove the air conditioning compressor and bracket.

20. Remove the upper half of the engine dipstick tube.

21. Remove the oil filler tube.

22. Remove the transmission dipstick tube and the accelerator cable at the tube.

23. Remove the fuel line at the fuel pump.

24. Remove the power steering pump.

25. Remove the head light bezels and the grille.

26. Remove the upper radiator support.

27. Remove the lower fan shroud and filler panel.

28. Remove the hood latch support.

29. Remove the condenser. Cap all openings.

30. Raise and support the vehicle safely.

31. Drain the engine oil.

32. Disconnect the exhaust pipes at the manifolds.

33. Remove the strut rods at the torque converter or flywheel underpan.

34. Remove the torque converter or flywheel cover.

35. Remove the starter.

36. Remove the flex plate-to-torque converter bolts (automatic transmissions).

37. Remove the bell housing-to-engine bolts.

38. Remove the engine mounting through bolts.

39. Lower the Van support the transmission using the proper equipment.

40. Attach an engine crane to the engine, pull the engine forward and upward and remove it from the Van.

To install:

41. Raise the engine into position.
42. Install the engine mount through bolts. Torque the bolts to 75 ft. lbs.
43. Install the bellhousing-to-engine bolts. Torque the bolts to 50 ft. lbs.
44. Install the flex plate-to-torque converter bolts (automatic transmissions). Torque the bolts to 40 ft. lbs.
45. Install the starter.
46. Install the torque converter or flywheel cover.
47. Install the strut rods at the torque converter or flywheel underpan.
48. Connect the exhaust pipes at the manifolds.
49. Install the fuel line at the fuel pump.
50. Install the condenser.
51. Install the hood latch support.
52. Install the lower fan shroud and filler panel.
53. Install the transmission dipstick tube and the accelerator cable at the tube.
54. Install the PCV valve.
55. Install the distributor cap.
56. Install the cruise control servo, servo bracket and transducer.
57. Install the oil filler pipe and the engine dipstick tube.
58. Install the thermostat housing.
59. Connect the heater hoses at the engine.
60. Connect the engine wiring harness from the firewall connection.
61. Install the air conditioning compressor mounting bracket.
62. Install the radiator and the shroud.
63. Install the radiator support bracket.
64. Install the TBI unit.
65. Connect the accelerator linkage and TVS cable.
66. Install the windshield wiper jar and bracket.
67. Install the air conditioning compressor.
68. Install the air conditioning vacuum reservoir.
69. Charge the air conditioning system, using the proper equipment.
70. If the Van is equipped with an automatic transmission, install the fluid cooler lines at the radiator.
71. Install the power steering reservoir.
72. Install the hood release cable.
73. Connect the radiator hoses at the radiator.
74. Install the head light bezels and the grille.
75. Install the air cleaner.
76. Install the outside air duct.
77. Install the engine cover.
78. Fill the cooling system.
79. Fill the crankcase.
80. Connect the battery cables.

81. Install the glove box.

5.0L AND 5.7L ENGINES

1. Disconnect the negative battery cable, then the positive battery cable, at the battery.
2. Drain the cooling system.
3. Remove the radiator coolant reservoir bottle.
4. Remove the upper radiator support.
5. Remove the grille and the lower grille valance.
6. Discharge the air conditioning system using the proper equipment and remove the air conditioning vacuum reservoir.
7. Remove the air conditioning condenser from in front of the radiator.
8. If the Van is equipped with an automatic transmission, remove the fluid cooler lines from the radiator.
9. Disconnect the radiator hoses at the radiator.
10. Remove the radiator support bracket and remove the radiator and the shroud.
11. Remove the engine cover.
12. Remove the air cleaner.
13. Disconnect the accelerator linkage.
14. Disconnect all hoses and wires at the carburetor or TBI unit.
15. Relieve the fuel system pressure and remove the carburetor or TBI unit.
16. Disconnect the engine wiring harness from the firewall connection.
17. Tag and disconnect all vacuum lines.
18. Remove the power steering pump. It's not necessary to disconnect the hoses; just lay it aside.
19. Disconnect the heater hoses at the engine.
20. Remove the thermostat housing.
21. Remove the oil filler tube.
22. Raise and support the vehicle safely.
23. Remove the cruise control servo, servo bracket and transducer.
24. Drain the engine oil.
25. Disconnect the exhaust pipes at the manifolds.
26. Remove the driveshaft and plug the end of the transmission.
27. Disconnect the transmission shift linkage and the speedometer cable.
28. Remove the fuel line from the fuel tank and at the fuel pump.
29. Remove the transmission mounting bolts.
30. Lower the Van, support the transmission and engine.
31. Remove the engine mount bracket-to-frame bolts.
32. Remove the engine mount through bolts.
33. Raise the engine slightly and remove the engine mounts. Support the

engine with wood between the oil pan and the crossmember.

34. Remove the manual transmission and clutch as follows:

- a. Remove the clutch housing rear bolts.
- b. Remove the bolts attaching the clutch housing to the engine and remove the transmission and clutch as a unit.

NOTE: Support the transmission as the last bolt is being removed to prevent damaging the clutch.

- c. Remove the starter and clutch housing rear cover.
- d. Loosen the clutch mounting bolts a little at a time to prevent distorting the disc until spring pressure is released. Remove all of the bolts, the clutch disc and the pressure plate.
35. Remove the automatic transmission as follows:
 - a. Lower the engine and support it on blocks.
 - b. Remove the starter and converter housing underpan.
 - c. Remove the flywheel-to-converter attaching bolts.
 - d. Support the transmission on blocks.
 - e. Disconnect the detent cable on the Turbo Hydra-Matic.
 - f. Remove the transmission-to-engine mounting bolts.
 - g. Remove the blocks from the engine only and glide the engine away from the transmission.

To install:

36. Raise the engine slightly and install the engine mounts. Torque the bolts to 40 ft. lbs.
37. Install the manual transmission and clutch as follows:
 - a. Install the clutch disc and the pressure plate. Tighten the clutch mounting bolts a little at a time to prevent distorting the disc.
 - b. Install the starter and clutch housing rear cover.
 - c. Install the bolts attaching the clutch housing to the engine and install the transmission and clutch as a unit. Torque the bolts to 40 ft. lbs.
 - d. Install the clutch housing rear bolts.
38. Install the automatic transmission as follows:
 - a. Position the transmission.
 - b. Install the transmission-to-engine mounting bolts.
 - c. Connect the throttle linkage and detent cable.
 - d. Install the flywheel-to-converter attaching bolts. Torque the bolts to 40 ft. lbs.
 - e. Install the starter and converter housing underpan.

39. Install the engine mount through bolts. Torque the bolts to 40 ft. lbs.

40. Install the engine mount bracket-to-frame bolts. Torque the bolts to 40 ft. lbs.

41. Install the clutch cross-shaft.

42. Install the transmission mounting bolts. Torque the bolts to 40 ft. lbs.

43. Connect the transmission shift linkage and the speedometer cable.

44. Install the driveshaft.

45. Install the condenser.

46. Install the hood latch support.

47. Install the lower fan shroud and filler panel.

48. Install the transmission dipstick tube and the accelerator cable at the tube.

49. Install the coolant hose at the intake manifold and the PCV valve.

50. Install the distributor cap.

51. Install the cruise control servo, servo bracket and transducer.

52. Install the oil filler pipe and the engine dipstick tube.

53. Install the thermostat housing.

54. Connect the heater hoses at the engine.

55. Connect the engine wiring harness from the firewall connection.

56. Install the radiator and the shroud.

57. Install the radiator support bracket.

58. Install the carburetor or TBI unit.

59. Connect the accelerator linkage.

60. Install the windshield wiper jar and bracket.

61. Install the air conditioning condenser.

62. Install the air conditioning vacuum reservoir.

63. Charge the air conditioning system using the proper equipment.

64. If the Van is equipped with an automatic transmission, install the fluid cooler lines at the radiator.

65. Install the radiator coolant reservoir bottle.

66. Connect the radiator hoses at the radiator.

67. Install the upper radiator support the grille and the lower grille valance.

68. Install the air cleaner.

69. Install the air stove pipe.

70. Install the engine cover.

71. Fill the cooling system.

72. Connect the battery cables.

7.4L ENGINE

1. Disconnect the battery cables.

2. Drain the cooling system.

3. Remove the engine cover.

4. Remove the air cleaner.

5. Remove the cruise control servo, servo bracket and transducer.

6. Remove the grille and lower grille valance.

7. Remove the upper radiator support.

8. Discharge the air conditioning system using the proper equipment and remove the air conditioning vacuum reservoir.

9. Remove the air conditioning condenser from in front of the radiator. Cap all openings at once!

10. Disconnect the radiator hoses at the radiator.

11. Remove the fluid cooler lines from the radiator.

12. Remove the radiator coolant reservoir bottle.

13. Remove the radiator support bracket and remove the radiator and the shroud.

14. Remove the power steering pump.

15. Remove the air conditioning compressor and cap all openings.

16. Disconnect the wiring fuel lines and linkage at the TBI unit.

17. Properly relieve the fuel system pressure and remove the TBI unit.

18. Disconnect the engine wiring harness from the firewall connection.

19. Disconnect the starter wires.

20. Disconnect the alternator wires.

21. Disconnect the temperature sensor wire.

22. Disconnect the oil pressure sender.

23. Disconnect the distributor and coil wiring.

24. Disconnect and plug the fuel supply and vapor lines.

25. Tag and disconnect all vacuum hoses.

26. Disconnect the heater hoses at the engine.

27. Remove the thermostat housing.

28. Remove the windshield wiper jar and bracket.

29. Remove the oil filler pipe and the engine dipstick tube.

30. Raise and support the vehicle safely.

31. Disconnect the exhaust pipes at the manifolds.

32. Remove the driveshaft and plug the end of the transmission.

33. Disconnect the transmission shift linkage and the speedometer cable.

34. Drain the engine oil.

35. Support the engine with a floor jack. Do not position the jack under the oil pan, crankshaft pulley or any sheet metal!

36. Attach an engine crane to the engine and take up its weight.

37. Remove the transmission mounting bolts.

38. Raise the engine slightly and remove the engine mounts. Support the engine with wood between the oil pan and the crossmember.

39. Lower the Van.

40. Raise the engine as necessary and

maneuver the engine/transmission assembly from the Van.

41. Separate the engine and transmission as follows:

a. Support the engine on blocks.

b. Remove the starter and converter housing underpan.

c. Remove the flywheel-to-converter attaching bolts.

d. Support the transmission on blocks.

e. Disconnect the detent cable.

f. Remove the transmission-to-engine mounting bolts.

g. Remove the blocks from the engine only and guide the engine away from the transmission.

42. Mount the engine on a work stand.

To install:

43. Install the automatic transmission as follows:

a. Position the transmission.

b. Install the transmission-to-engine mounting bolts. Torque the bolts to 40 ft. lbs.

c. Connect the throttle linkage detent cable on the Turbo Hydra-Matic.

d. Install the flywheel-to-converter attaching bolts. Torque the bolts to 40 ft. lbs.

e. Install the starter and converter housing underpan.

44. Raise the engine/transmission and guide the assembly into position in the Van.

45. Raise the engine slightly and install the engine mounts. Torque the mount-to-block bolts to 36 ft. lbs.

46. Install the engine mount through bolts. Torque the bolts to 75 ft. lbs.

47. Install the engine mount bracket-to-frame bolts. Torque the front mount bolts to 30 ft. lbs.; the rear mount bolts to 40 ft. lbs.

48. Install the transmission mounting bolts. Torque the nuts to 36 ft. lbs.

49. Connect the transmission shift linkage and the speedometer cable.

50. Install the driveshaft.

51. Connect the exhaust pipes at the manifolds.

52. Install the oil filler pipe and the engine dipstick tube.

53. Install the windshield wiper jar and bracket.

54. Install the thermostat housing.

55. Connect the heater hoses at the engine.

56. Connect all vacuum hoses.

57. Connect the fuel supply and vapor lines.

58. Connect the distributor and coil wiring.

59. Connect the oil pressure sender.

60. Connect the temperature sensor wire.

61. Connect the alternator wires.

62. Connect the starter wires.

63. Connect the engine wiring harness at the firewall connection.
64. Install the TBI unit.
65. Connect the wiring, fuel lines and linkage at the TBI unit.
66. Install the air conditioning compressor.
67. Install the power steering pump.
68. Install the radiator and the shroud.
69. Install the radiator support bracket.
70. Install the radiator coolant reservoir bottle.
71. Install the fluid cooler lines at the radiator.
72. Connect the radiator hoses at the radiator.
73. Install the air conditioning condenser.
74. Install the air conditioning vacuum reservoir.
75. Charge the air conditioning system using the proper equipment.
76. Install the upper radiator support.
77. Connect the radiator hoses at the radiator.
78. Install the grille and the lower grille valance.
79. Install the cruise control servo, servo bracket and transducer.
80. Fill the crankcase.
81. Install the air cleaner.
82. Install the engine cover.
83. Fill the cooling system.
84. Connect the battery cables.

Cylinder Head

REMOVAL & INSTALLATION

4.3L Engine

1. Disconnect the negative battery cable.
2. Remove the engine cover and drain the cooling system.
3. Relieve the fuel system pressure and remove the intake manifold.
4. Remove the exhaust manifold.
5. Remove the air pipe at the rear of the head (right cylinder head).
6. Remove the alternator mounting bolt at the cylinder head (right cylinder head).
7. Remove the power steering pump and brackets from the cylinder head, and lay them aside (left cylinder head).
8. Remove the air conditioner compressor, and lay it aside (left cylinder head).
9. Remove the rocker arm cover.
10. Remove the spark plugs.
11. Remove the rocker arms and pushrods.
12. Remove the cylinder head bolts.
13. Remove the cylinder head.

To install:

14. Clean all gasket mating surfaces,

Cylinder head bolt torque sequence—
4.3L engine

install a new gasket and reinstall the cylinder head.

15. Install the cylinder heads using new gaskets. Install the gaskets with the head up.

NOTE: Coat a steel gasket on both sides with sealer. If a composition gasket is used, do not use sealer.

16. Clean the bolts, apply sealer to the threads, and install them hand tight.

17. Tighten the head bolts a little at a time to the proper sequence and the proper torque specifications.

18. Install the intake and exhaust manifolds.

19. Install the rocker arms and pushrods.

20. Adjust the rocker arms.

21. Install the spark plugs.

22. Install the rocker arm cover.

23. Install the air conditioner compressor.

24. Install the power steering pump and brackets.

25. Install the alternator mounting bolt at the cylinder head.

26. Install the air pipe at the rear of the head.

27. Install the exhaust manifold.

28. Install the intake manifold.

29. Install the engine cover.

30. Connect the negative battery cable.

4.8L Engine

1. Disconnect the negative battery cable. Drain cooling system. Remove air cleaner assembly.

2. Properly relieve the fuel pump pressure. Disconnect the fuel line at the carburetor. Disconnect the accelerator and transmission linkages. Disconnect all required electrical and vacuum lines.

3. Remove the combination manifold assembly retaining bolts. Remove

Cylinder head bolt torque sequence—
5.0L and 5.7L engines

the combination manifold from the engine.

4. Remove the valve cover. Remove the rocker arms and pushrods. Keep them in order for reinstallation.

5. If equipped, disconnect the AIR injection hose at the check valve. Disconnect the upper radiator hose at the thermostat housing. Remove the battery ground strap.

6. Remove the cylinder head retaining bolts. Remove the cylinder head from the engine.

7. Installation is the reverse of the removal procedure. Be sure that the cylinder bolt threads in the block and threads on the bolts are cleaned, as dirt will affect bolt torque.

8. Coat the threads of the cylinder head bolts with sealing compound 1052080 or equivalent.

9. Position the new gasket over the dowel pins. Torque the cylinder head bolts a little at a time, to specification, and in the proper sequence.

5.0L and 5.7L Engines

1. Disconnect the negative battery cable.

2. Properly relieve the fuel system pressure.

3. Drain the cooling system.

4. Remove the intake manifold.

5. Remove the exhaust manifolds and tie out of the way.

6. If the vehicle is equipped with air conditioning, remove the air conditioning compressor and the forward mounting bracket and lay the compressor aside. Do not disconnect any of the refrigerant lines.

7. Remove the valve covers. Back off the rocker arm nuts and pivot the rocker arms out of the way so that the pushrods can be removed. Identify the pushrods so that they can be installed in their original positions.

8. Remove the cylinder head bolts and remove the heads.

9. Install the cylinder heads using new gaskets. Install the gaskets with the word **HEAD** up.

NOTE: Coat a steel gasket on both sides with sealer. If a composition gasket is used, do not use sealer.

10. Clean the bolts, apply sealer to

Cylinder head bolt torque sequence—
7.4L engine

the threads, and install them hand tight.

11. Tighten the head bolts a little at a time to the proper sequence and torque specifications.

12. Install the intake and exhaust manifolds.

13. Adjust the rocker arms.

7.4L Engine

RIGHT SIDE

1. Disconnect the negative battery cable.

2. Properly relieve the fuel system pressure.

3. Drain the cooling system.

4. Remove the intake manifold.

5. Remove the exhaust manifolds.

6. Remove the alternator on 1986 C/K series and 1987-90 R/V series.

7. Remove the power steering pump and lay it aside on the Van.

8. Remove the AIR pump and brackets.

9. If the vehicle is equipped with air conditioning, remove the air conditioning compressor and the forward mounting bracket and lay the compressor aside. Do not disconnect any of the refrigerant lines.

10. Remove the idler pulley and A/C compressor rear bracket on the Van.

11. Remove the rocker arm cover.

12. Remove the spark plugs.

13. Remove the AIR pipes at the rear of the head.

14. Disconnect the ground strap at the rear of the head.

15. Disconnect the sensor wire.

16. Back off the rocker arm nuts and pivot the rocker arms out of the way so that the pushrods can be removed. Identify the pushrods so that they can be installed in their original positions.

17. Remove the cylinder head bolts and remove the heads.

To install:

18. Thoroughly clean the mating surfaces of the head and block. Clean the bolt holes thoroughly.

19. Install the cylinder heads using new gaskets. Install the gaskets with the word **HEAD** up.

NOTE: Coat a steel gasket on both sides with sealer. If a composition gasket is used, do not use sealer.

20. Clean the bolts, apply sealer to the threads, and install them hand tight.

21. Tighten the head bolts a little at a time to the proper sequence and to the proper torque specifications.

22. Install the intake and exhaust manifolds.

23. Install the pushrods.

24. Install the rocker arms and adjust properly.

25. Connect the sensor wire.

26. Connect the ground strap at the rear of the head.

27. Install the AIR pipes at the rear of the head.

28. Install the spark plugs.

29. Install the rocker arm cover.

30. Install the air conditioning compressor and the forward mounting bracket.

31. Install the AIR pump.

32. Install the alternator.

LEFT SIDE

1. Disconnect the negative battery cable.

2. Properly relieve the fuel system pressure.

3. Drain the cooling system.

4. Remove the intake manifold.

5. Remove the exhaust manifolds.

6. Remove the alternator and brackets on the 1988-90 C/K series and the Van.

7. Remove the power steering pump and brackets and lay it to one side on the 1988-90 C/K series.

8. Remove the rocker arm cover.

9. Remove the spark plugs.

10. Remove the AIR pipes at the rear of the head.

11. Disconnect the ground strap at the rear of the head.

12. Disconnect the sensor wire.

13. Back off the rocker arm nuts and pivot the rocker arms out of the way so that the pushrods can be removed. Identify the pushrods so that they can be installed in their original positions.

14. Remove the cylinder head bolts and remove the heads.

To install:

15. Thoroughly clean the mating surfaces of the head and block. Clean the bolt holes thoroughly.

16. Install the cylinder heads using new gaskets. Install the gaskets with the word **HEAD** up.

NOTE: Coat a steel gasket on both sides with sealer. If a composition gasket is used, do not use sealer.

17. Clean the bolts, apply sealer to the threads, and install them hand tight.

18. Tighten the head bolts a little at a time to the proper sequence and torque specifications.

19. Install the intake and exhaust manifolds.

20. Install the pushrods.

21. Install the rocker arms.

22. Connect the sensor wire.

23. Connect the ground strap at the rear of the head.

24. Install the AIR pipes at the rear of the head.

25. Install the spark plugs.

26. Install the rocker arm cover.

27. Install the air conditioning com-

pressor and the forward mounting bracket.

28. Install the alternator and power steering pump.

Valve Lash

ADJUSTMENT

All engines use hydraulic lifters, which require no periodic adjustment. In the event of cylinder head removal or any operation that requires disturbing the rocker arms, the rocker arms will have to be adjusted.

1. Remove the rocker covers and gaskets.

2. Adjust the valves on V6 and V8 engines as follows:

a. Crank the engine until the mark on the damper aligns with the TDC or 0 mark on the timing tab and the engine is in No. 1 firing position. This can be determined by placing the fingers on the No. 1 cylinder valves as the marks align. If the valves do not move, it is in No. 1 firing position. If the valves move, it is in No. 6 firing position (No. 4 on the V6) and the crankshaft should be rotated 1 more revolution to the No. 1 firing position.

b. The adjustment is made in the same manner as 6 cylinder engines.

c. With the engine in No. 1 firing position, the following valves can be adjusted:

V6 Engine

Exhaust—1, 5, 6

Intake—1, 2, 3

V8 Engine

Exhaust—1, 3, 4, 8

Intake—1, 2, 5, 7

d. Crank the engine 1 full revolution until the marks are again in alignment. This is No. 6 firing position (No. 4 on the V6). The following valves can now be adjusted:

V6 Engine

Exhaust—2, 3, 4

Intake—4, 5, 6

V8 Engine

Exhaust—2, 5, 6, 7

Intake—3, 4, 6, 8

3. Reinstall the rocker arm covers using new gaskets.

4. Install the distributor cap and wire assembly.

Rocker Arm

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. On Van, remove the engine cover.

2. Remove all the necessary components in order to gain access to the engine valve covers. As required, proper-

Cylinder head and components—4.3L engine

ly relieve the fuel system pressure before disconnecting any fuel lines.

3. Remove the valve cover retaining bolts. Remove the valve cover from the engine.

4. Remove the rocker arm assemblies. Keep them in order for reinstallation.

5. Installation is the reverse of the removal procedure. Be sure to use new gaskets or RTV sealant, as necessary.

Intake Manifold

REMOVAL & INSTALLATION

1986 C/K Series and 1987-90 R/V Series

4.3L, 5.0L, 5.7L AND 7.4L ENGINES

1. Disconnect the negative battery cable.
2. Drain the cooling system.
3. Remove the air cleaner assembly.
4. Remove the thermostat housing and the bypass hose. It is not necessary to remove the top radiator hose from the thermostat housing.
5. Disconnect the heater hose at the rear of the manifold.
6. Disconnect all electrical connections and vacuum lines from the manifold. Remove the EGR valve if necessary.
7. On vehicles equipped with power brakes remove the vacuum line from the vacuum booster to the manifold.
8. Remove the distributor.
9. Move the air conditioning compressor to one side, if necessary.
10. Relieve the fuel system pressure.
11. Remove the fuel line to the carburetor or TBI unit.
12. Remove the carburetor linkage.
13. Disconnect the electrical connections at the TBI unit.
14. Remove the carburetor or TBI unit, if necessary.
15. Remove the intake manifold bolts. Remove the manifold and the gaskets. Remember to reinstall the O-ring seal between the intake manifold

and timing chain cover during assembly, if so equipped.

16. Reconnect all wires, hoses and linkage. Use plastic gasket retainers to prevent the manifold gasket from slipping out of place, if so equipped.

Make sure all gasket mating surfaces are thoroughly clean and on all except the 7.4L engine, place a $\frac{3}{16}$ " bead of RTV type silicone sealer on the front and rear ridges of the cylinder block-to-manifold mating surfaces. Extend the bead $\frac{1}{2}$ " up each cylinder head to seal and retain the manifold side gaskets. Torque the manifold bolts in the proper sequence and to the proper specification.

1988-90 C/K Series

4.3L, 5.0L AND 5.7L ENGINES

1. Disconnect the negative battery cable. Drain the cooling system.
2. Remove the air cleaner assembly.
3. Remove the thermostat housing and the bypass hose. It is not necessary to remove the top radiator hose from the thermostat housing.
4. Disconnect the heater hose at the rear of the manifold.
5. Disconnect all electrical connections and vacuum lines from the manifold. Remove the EGR valve if necessary.
6. Remove the power brake vacuum line from the vacuum booster to the manifold.
7. Remove the distributor.
8. Relieve the fuel system pressure and remove the fuel line at the TBI unit.
9. Remove the accelerator linkage.
10. Properly relieve the fuel system pressure and remove the TBI unit.

INITIAL TIGHTENING SEQUENCE

FINAL TIGHTENING SEQUENCE

Intake manifold torque sequence—4.3L engine

11. Remove the intake manifold bolts. Remove the manifold and the gaskets.

To install:

NOTE: Before installing the intake manifold, be sure that the gasket surfaces are thoroughly clean.

13. Use plastic gasket retainers to prevent the manifold gasket from slipping out of place, if so equipped.

14. Install the manifold and the gaskets. Remember to reinstall the O-ring between the intake manifold and timing chain cover, if so equipped.

15. Install the intake manifold bolts and torque to the proper specification.

16. Install the TBI unit.

17. Install the TBI linkage.

18. Install the fuel line.

19. Install the distributor.

20. Install the vacuum line between the vacuum booster and manifold.

21. Connect all electrical connections and vacuum lines at the manifold. Install the EGR valve if necessary.

4. Remove the upper radiator hose, thermostat housing and the bypass hose.

5. Disconnect the heater hose and pipe.

6. Tag and disconnect all electrical connections and vacuum lines from the manifold.

7. Disconnect the accelerator linkage.

8. Disconnect the cruise control cable.

9. Disconnect the TVS cable.

10. Properly relieve the fuel system pressure. Remove the fuel line at the TBI unit.

11. Remove the TBI unit.

12. Remove the distributor.

13. Remove the cruise control transducer.

14. Disconnect the ignition coil wires.

15. Remove the EGR solenoid and bracket.

16. Remove the MAP sensor and bracket.

17. Remove the air conditioning compressor rear bracket.

18. Remove the front alternator/AIR pump bracket.

19. Remove the intake manifold bolts.

20. Remove the manifold and the gaskets and seals.

To install:

NOTE: Before installing the intake manifold, be sure that the gasket surfaces are thoroughly clean. Remember to reinstall the

36. Connect the heater hose and pipe.
37. Install the upper radiator hose, thermostat housing and the bypass hose.
38. Install the air cleaner assembly.
39. Fill the cooling system.
40. Connect the battery.

Exhaust Manifold

REMOVAL & INSTALLATION

Except Van

4.3L, 5.0L AND 5.7L ENGINES

Tab locks are used on the front and rear pairs of bolts on each exhaust manifold. When removing the bolts, straighten the tabs from beneath the vehicle using a suitable tool. When installing the tab locks, bend the tabs against the sides of the bolt, not over the top of the bolt.

1. Disconnect the negative battery cable. Remove the air cleaner.
2. Remove the hot air shroud, if so equipped.
3. On some vehicles it may be necessary to loosen the alternator and remove its lower bracket.
4. On some vehicles it may be necessary to remove A/C compressor rear bracket on the manifold left side and the diverter valve and bracket on the right side.

NOTE: On models with air conditioning it may be necessary to remove the compressor, and tie it out of the way. Do not disconnect the compressor lines.

5. Disconnect the oxygen sensor wire, if so equipped.

6. On 1988-90 C/K series, disconnect the power steering pump rear bracket on the manifold left side and the AIR hose at the check valve.

7. Raise and support the vehicle safely.

8. Disconnect the crossover pipe from both manifolds.

9. Remove the manifold bolts and remove the manifold(s). Some models have lock tabs on the front and rear manifold bolts which must be removed before removing the bolts. These tabs can be bent with a drift pin.

10. Installation is the reverse of removal. Torque the bolts to the proper specification and in the proper sequence.

7.4L ENGINE - RIGHT SIDE

1. Disconnect the negative battery cable.

2. Remove the heat stove pipe.

3. Remove the dipstick tube.

4. Disconnect the AIR hose at the check valve.

5. Remove the spark plugs.

6. Raise and support the vehicle safely. Disconnect the exhaust pipe at the manifold.

7. Lower the vehicle and remove the manifold bolts and spark plug heat shields.

8. Remove the manifold.

To install:

9. Clean the mating surfaces.

10. Clean the stud threads.

11. Install the manifold and bolts. Tighten the bolts to 40 ft. lbs. starting from the center bolts and working towards the outside.

12. Connect the exhaust pipe at the manifold.

13. Install the spark plugs.

14. Connect the AIR hose at the check valve.

15. Install the dipstick tube.

16. Install the heat stove pipe.

17. Connect the battery.

7.4L ENGINE - LEFT SIDE

1. Disconnect the negative battery cable.

2. Disconnect the oxygen sensor wire.

3. Disconnect the AIR hose at the check valve.

4. Remove the spark plugs.

5. Raise and support the vehicle safely. Disconnect the exhaust pipe at the manifold.

6. Lower the vehicle and remove the manifold bolts and spark plug heat shields.

1. Heat shield
2. Washer
3. Tab washer
4. Bolt/stud

Exhaust manifold installation - 4.3L engine

7. Remove the manifold.

To install:

8. Clean the mating surfaces.

9. Clean the stud threads.

10. Install the manifold and bolts. Tighten the bolts to 40 ft. lbs. starting from the center bolts and working towards the outside.

11. Connect the exhaust pipe at the manifold.

12. Install the spark plugs.

13. Connect the AIR hose at the check valve.

14. Connect the oxygen sensor wire.

15. Connect the battery.

Van

4.3L, 5.0L AND 5.7L ENGINES

Tab locks are used on the front and rear pairs of bolts on each exhaust manifold. When removing the bolts, straighten the tabs from beneath the Van using a suitable tool. When installing the tab locks, bend the tabs against the sides of the bolt, not over the top of the bolt.

1. Disconnect the negative battery cable. Remove the air cleaner.

2. Remove the hot air shroud, if so equipped.

3. Loosen the alternator and remove its lower bracket.

4. On some vehicles it may be necessary to remove the power steering pump rear bracket on the left manifold and the dipstick tube bracket on the right side.

5. Disconnect the oxygen sensor wire, if so equipped.

6. Raise and support the vehicle safely.

7. Disconnect the crossover pipe from both manifolds.

NOTE: On models with air conditioning it may be necessary to remove the compressor, and tie it out of the way. Do not disconnect the compressor lines.

8. Lower the vehicle, remove the manifold bolts and remove the mani-

fold(s). Some models have lock tabs on the front and rear manifold bolts which must be removed before removing the bolts. These tabs can be bent with a drift pin.

9. Installation is the reverse of removal. Torque the bolts to the proper specification and in the proper sequence.

7.4L ENGINE - RIGHT SIDE

1. Disconnect the negative battery cable.

2. Remove the heat stove pipe.

3. Remove the dipstick tube.

4. Disconnect the AIR hose at the check valve.

5. Remove the spark plugs.

6. Raise and support the vehicle safely and disconnect the exhaust pipe at the manifold.

7. Lower the vehicle and remove the manifold bolts and spark plug heat shields.

8. Remove the manifold.

To install:

9. Clean the mating surfaces.

10. Clean the stud threads.

11. Install the manifold and bolts. Tighten the bolts to 40 ft. lbs. starting from the center bolts and working towards the outside.

12. Connect the exhaust pipe at the manifold.

13. Install the spark plugs.

14. Connect the AIR hose at the check valve.

15. Install the dipstick tube.

16. Install the heat stove pipe.

17. Connect the battery.

7.4L ENGINE - LEFT SIDE

1. Disconnect the negative battery cable.

2. Disconnect the oxygen sensor wire.

3. Disconnect the AIR hose at the check valve.

4. Remove the spark plugs.

5. Raise and support the vehicle safely and disconnect the exhaust pipe at the manifold.

6. Lower the vehicle and remove the manifold bolts and spark plug heat shields.

7. Remove the manifold.

To install:

8. Clean the mating surfaces.
9. Clean the stud threads.
10. Install the manifold and bolts. Tighten the bolts to 40 ft. lbs. starting from the center bolts and working towards the outside.
11. Connect the exhaust pipe at the manifold.
12. Install the spark plugs.
13. Connect the AIR hose at the check valve.
14. Connect the oxygen sensor wire.
15. Connect the battery.

Combination Manifold

REMOVAL & INSTALLATION

1986 C/K Series

4.8L ENGINE

1. Disconnect the negative battery cable.
2. Remove the air cleaner.
3. Disconnect the throttle controls at the bellcrank.
4. Remove the carburetor, if necessary.
5. Disconnect the fuel and vacuum lines from the manifold.
6. Remove the AIR pump and bracket.
7. Disconnect the PCV hose.
8. Disconnect the exhaust pipe.
9. Remove the manifold heat stove.
10. Remove the clamps, bolts and washers and remove the combination manifold.
11. Separate the manifolds by removing the bolts and nuts.

To install:

12. Clean the mating surfaces.
13. Clean the stud threads.
14. Assemble the manifolds with a new gasket and leave the nuts finger tight.
15. Install a new gasket over the manifold studs on the cylinder head and install the manifold assembly.

- | | |
|---------------------|--------------------|
| 1. Bolt | 6. Washer |
| 2. Clamp | 7. Stud |
| 3. Nut | 8. Gasket |

| 5. Bolt | 10. Nut |

Combination manifolds—4.8L engine

Cut these portions off the front cover to pan seal—4.8L engine

16. Install the bolts, clamps and nuts.

NOTE: Always tighten the manifold to cylinder head bolts and nuts (38 ft. lbs.) before tightening the manifold center bolts and nuts (44 ft. lbs.).

17. The remainder of the installation is the reverse of removal.

Timing Chain Cover and Oil Seal

REMOVAL & INSTALLATION

4.3L, 5.0L and 5.7L Engines

1. Disconnect the negative battery cable. Drain the cooling system.
2. Remove the crankshaft pulley and damper. Remove the water pump.

Seal installation with cover installed—4.3L, 5.0L, 5.7L and 7.4L engines

Remove the screws holding the timing case cover to the block and remove the cover and gaskets.

3. Use a suitable tool to pry the old seal out of the front face of the cover.

4. Install the new seal so that the open end is toward the inside of the cover.

NOTE: Coat the lip of the new seal with oil prior to installation.

5. Check that the timing chain oil slinger is in place against the crankshaft sprocket.

6. Apply sealer to the front cover. Install the cover carefully onto the locating dowels.

7. Tighten the attaching screws to 72–96 inch lbs.

4.8L Engine

1. Disconnect the battery.
2. Drain the cooling system.
3. Remove the water pump.
4. Remove the crankshaft pulley and damper.
5. Remove the oil pan-to-front cover bolts.
6. Remove the screws holding the timing case cover to the block, pull the cover forward enough to cut the front oil pan seal. Cut the seal flush with the block on both sides.

Installing the timing gear cover and seal—4.8L engine

Installing the timing gear cover and seal—4.8L engine

7. Pull off the cover and gaskets.
 8. Use a suitable tool to pry the old seal out of the front face of the cover.
- To install:**

9. Lubricate the new seal lip with engine oil and using a seal centering tool and installer J-23042, or equivalent, press the new seal into place. Leave the tool in position on the seal.

10. Install a new front pan seal, cutting the tabs off.

11. Coat a new cover gasket with adhesive sealer and position it on the block.

12. Apply a 1/8 in. bead of RTV gasket material to the front cover. Install the cover carefully in place with the centering tool still attached.

13. Tighten the timing gear cover to block bolts to 80 inch lbs.

14. Tighten the cover-to-pan bolts to 45 inch lbs.

15. Install the damper.

16. Install the water pump.

17. Connect the battery cables.

18. Fill the cooling system.

7.4L Engine

1. Disconnect the negative battery cable.

2. Drain the cooling system.

3. Remove the water pump.

4. Remove the crankshaft pulley and damper.

5. Remove the oil pan-to-front cover bolts.

6. Remove the screws holding the timing case cover to the block, pull the cover forward enough to cut the front oil pan seal. Cut the seal flush with the block on both sides.

7. Pull off the cover and gaskets.

8. Use a suitable tool to pry the old seal out of the front face of the cover.

To install:

9. Using seal driver J-22102, or equivalent, install the new seal so that the open end is toward the inside of the cover.

NOTE: Coat the lip of the new seal with oil prior to installation.

1. Timing marks
2. Camshaft gear

Torsional damper and crankshaft pulley installation—6.2L diesel engine

Timing Chain and Sprockets

REMOVAL & INSTALLATION

4.3L, 5.0L, 5.7L and 7.4L Engines

1. Disconnect the negative battery cable. Remove the radiator, water pump, the harmonic balancer and the crankcase front cover. This will allow access to the timing chain.

2. Crank the engine until the timing marks on both sprockets are nearest each other and in line between the shaft centers.

3. Take out the 3 bolts that hold the camshaft gear to the camshaft. This gear is a light press fit on the camshaft and will come off easily. It is located by a dowel. The chain comes off with the camshaft gear.

NOTE: A gear puller will be required to remove the crankshaft gear.

4. Without disturbing the position of the engine, mount the new crankshaft gear on the shaft, and mount the chain over the camshaft gear. Arrange the camshaft gear in such a way that

the timing marks will line up between the shaft centers and the camshaft locating dowel will enter the dowel hole in the cam sprocket.

5. Place the cam sprocket, with its chain mounted over it, in position on the front of the vehicle and pull up with the 3 bolts that hold it to the camshaft.

6. After the gears are in place, turn the engine 2 full revolutions to make certain that the timing marks are in correct alignment between the shaft centers.

Endplay of the camshaft is zero.

Camshaft Timing Gear

REMOVAL & INSTALLATION

4.8L Engine

The camshaft on these engines is gear driven, unlike the chain driven V6 and V8 engines. The camshaft must be removed to replace the gear.

1. Disconnect the negative battery cable. Remove the camshaft and place in an arbor press.

NOTE: Support the camshaft gear not the thrust plate.

2. Press the gear off of the camshaft and remove the thrust plate and the spacer.

To install:

3. Support the camshaft at the front journal with tool J-22912-01 or equivalent, and mount the camshaft in a press.

4. Lubricate the thrust plate with engine oil.

5. Install the key if removed.

Timing alignment marks—5.0L, 5.7L and 7.4L engines

6. Install the spacer making sure the chamfer in the spacer faces toward the journal radius.

7. Install the thrust plate.

8. Install the camshaft gear on with the timing mark to the outside and press the gear on until it bottoms on the spacer.

9. Remove the camshaft from the press.

NOTE: The clearance between the camshaft and thrust plate should be 0.003–0.008 in.

Camshaft

REMOVAL & INSTALLATION

4.3L Engine

1986 C/K SERIES AND 1987 R/V SERIES

1. Disconnect the negative battery

Timing alignment marks—4.3L engine

Removing the camshaft thrust plate bolts—4.8L engine

cable and properly relieve the fuel system pressure.

2. Remove the fan, shroud and drain and remove the radiator.

3. Remove the fuel pump.

4. Remove the air cleaner.

5. Remove the alternator belt, loosen the alternator bolts and move the alternator to the side.

6. Remove the rocker arm covers.

7. Disconnect the fuel line.

8. Remove the water pump.

9. Remove the torsional damper.

10. Remove the front cover.

11. Disconnect the electrical and vacuum connections.

12. Mark the distributor as to location in the block. Remove the distributor.

13. Remove the intake manifold, pushrods and hydraulic lifters.

14. Remove the fuel pump pushrod.

15. Align the timing marks and remove the camshaft sprocket bolts.

16. Remove the camshaft sprocket and timing chain. Tap the sprocket on its lower edge to loosen it.

17. Remove the crankshaft sprocket, as required.

18. Support the engine and remove the front engine mount through bolts.

19. Raise the engine and install two or three $\frac{5}{16}$ –18 bolts 4–5 in. long into the camshaft threaded holes to handle the camshaft and carefully pull the camshaft from the block.

20. Inspect the shaft for signs of excessive wear or damage.

To install:

21. Liberally coat camshaft and bearing with heavy engine oil or engine assembly lubricant and insert the cam into the engine.

22. Lower the engine and install the engine mount through bolts.

23. Align the timing marks on the camshaft and crankshaft gears.

24. Install the camshaft sprocket and chain and tighten the bolts to 18 ft. lbs.

25. Install the fuel pump and pushrod.

26. Install the hydraulic lifters and pushrods.

27. Adjust the valves.

28. Install the intake manifold.

29. Install the distributor.

30. Install the front cover assembly.

31. Install the torsional damper.

32. Install the water pump.

33. Reconnect the fuel line.

34. Install the rocker arm covers.

35. Install the alternator.

36. Install the fan, shroud and radiator.

37. Install the air cleaner.

38. Refill the cooling system.

39. Connect the battery cable.

1986-87 VAN

1. Disconnect the negative battery

1. Timing marks
2. Camshaft
3. Thrust plate
4. Camshaft gear
5. Thrust plate bolts
6. Crankshaft gear

Camshaft and components installation and alignment—4.8L engine

cable and properly relieve the fuel system pressure.

2. Remove the rocker arm covers.
3. Remove the intake manifold, pushrods and hydraulic lifters.
4. Remove the outside air duct.
5. Remove the power steering reservoir out of the way.
6. Remove the upper fan shroud bolts.
7. Drain and remove the radiator.
8. Disconnect the hood release cable at the latch.
9. Remove the upper fan shroud.
10. Remove the AIR pump, generator, air conditioning compressor, and power steering pump belts.
11. Remove the AIR pump and bracket.
12. Remove the water pump.
13. Remove the torsional damper.
14. Remove the front cover.
15. Remove the fuel pump and pushrod.
16. Align the timing marks on the timing gears.
17. Remove the camshaft sprocket and timing chain. Tap the sprocket on its lower edge to loosen it.
18. Remove the crankshaft sprocket, as required.
19. Support the engine and remove the front engine mount through bolts.
20. Install two or three $\frac{5}{16}$ -18 bolts 4-5 in. long into the camshaft threaded holes to handle the camshaft and carefully pull the camshaft from the block.
21. Inspect the shaft for signs of excessive wear or damage.

To install:

22. Liberally coat camshaft and bearing with heavy engine oil or engine assembly lubricant and insert the cam into the engine.
23. Lower the engine and install the engine mount through bolts.
24. Align the timing marks on the camshaft and crankshaft gears.
25. Install the camshaft sprocket and chain and tighten the bolts to 18 ft. lbs.
26. Install the fuel pump and pushrod.
27. Install the front cover assembly.
28. Install the water pump.
29. Install the AIR pump and bracket.
31. Remove the AIR pump, generator, air conditioning compressor, and power steering pump belts.
32. Install the torsional damper.
33. Place into position the upper fan shroud.
34. Install the hood release cable.
35. Install the radiator.
36. Install the upper fan shroud bolts.
37. Install the power steering reservoir.
38. Install the outside air ducts.

39. Install the hydraulic lifters and pushrods and adjust the valves.
40. Install the rocker arm covers.
41. Connect the battery negative cable.

1988-90 R/V SERIES AND 1988-90 VAN

1. Disconnect the negative battery cable and properly relieve the fuel system pressure.
2. Remove the rocker arm covers.
3. Remove the intake manifold, pushrods and hydraulic lifters.
4. Remove the outside air duct.
5. Remove the power steering reservoir out of the way.
6. Remove the upper fan shroud bolts.
7. Drain and remove the radiator.
8. Disconnect the hood release cable at the latch.
9. Remove the upper fan shroud.
10. Remove the water pump.
11. Remove the torsional damper.
12. Remove the front cover.
13. Align the timing marks and remove the camshaft sprocket bolts.
14. Remove the camshaft sprocket and timing chain. Tap the sprocket on its lower edge to loosen it.
15. Remove the crankshaft sprocket, as required.
16. Support the engine and remove the front engine mount through bolts.
17. Install two or three $\frac{5}{16}$ -18 bolts 4-5 in. long into the camshaft threaded holes to handle the camshaft and carefully pull the camshaft from the block.
18. Inspect the shaft for signs of excessive wear or damage.

To install:

19. Liberally coat camshaft and bearing with heavy engine oil or engine assembly lubricant and insert the cam into the engine.
20. Lower the engine and install the engine mount through bolts.
21. Align the timing marks on the camshaft and crankshaft gears.
22. Install the camshaft sprocket and chain and tighten the bolts to 21 ft. lbs.
23. Install the front cover assembly.
24. Install the torsional damper.
25. Install the water pump.
26. Install the fan shroud and radiator.
27. Connect the hood release cable at the latch.
28. Install the outside air duct.
29. Install the hydraulic lifters and pushrods.
30. Adjust the valves.
31. Install the rocker arm covers.
32. Install the intake manifold.
33. Refill the cooling system.
34. Connect the battery cable.

1988-90 C/K SERIES

1. Disconnect the negative battery cable and properly relieve the fuel system pressure.
2. Remove the air cleaner.
3. Remove the fan, shroud and drain and remove the radiator.
4. Remove the rocker arm covers.
5. Remove the water pump.
6. Remove the torsional damper.
7. Remove the front cover.
8. Mark the distributor as to location in the block. Remove the distributor.

Install two or three $\frac{5}{16}$ -18 bolts 4-5 inches long into the camshaft threaded holes to handle the camshaft—4.3L, 5.0L, 5.7L and 7.4L engines

9. Remove the intake manifold, pushrods and hydraulic lifters.

10. Align the timing marks and remove the camshaft sprocket bolts.

11. Remove the camshaft sprocket and timing chain. Tap the sprocket on its lower edge to loosen it.

12. Remove the screws and the thrust plate.

13. Remove the crankshaft sprocket, as required.

14. Install two or three $\frac{5}{16}$ -18 bolts 4-5 in. long into the camshaft threaded holes to handle the camshaft and carefully pull the camshaft from the block.

15. Inspect the shaft for signs of excessive wear or damage.

To install:

16. Liberally coat camshaft and bearing with heavy engine oil or engine assembly lubricant and insert the cam into the engine.

17. Install the screws and the thrust plate.

18. Install the crankshaft sprocket, as required.

19. Align the timing marks on the camshaft and crankshaft gears.

20. Install the camshaft sprocket and chain and tighten the bolts to 23 ft. lbs.

21. Install the hydraulic lifters and pushrods.

22. Adjust the valves.

23. Install the intake manifold.

24. Install the front cover assembly.

26. Install the torsional damper.

27. Install the water pump.

28. Install the rocker arm covers.

29. Install the fan, shroud and radiator.

30. Install the air cleaner.

31. Refill the cooling system.

32. Connect the battery cable.

4.8L Engine

1986 C/K SERIES

1. Remove the engine assembly and mount in a suitable stand.

2. Remove the hydraulic lifters.

3. Remove the timing gear cover.

4. Remove the fuel pump.

5. Remove the distributor.

6. Align the timing marks on the camshaft and crankshaft gears.

7. Remove the thrust plate bolts.

8. Support and carefully remove the camshaft.

9. If either the camshaft or the camshaft gear is being renewed, the gear must be pressed off the camshaft. The replacement parts must be assembled in the same way. When placing the gear on the camshaft, press the gear onto the shaft until it bottoms against the gear spacer ring. The end clearance of the thrust plate should be 0.003-0.008 in.

10. Pre-lube the camshaft lobes with clean engine oil and then install the camshaft assembly in the engine. Be careful not to damage the Bearings.

11. Turn the crankshaft and the camshaft gears so that the timing marks align. Push the camshaft into position and install and torque the thrust plate bolts to 80 inch lbs.

12. Check camshaft and crankshaft gear runout with a dial indicator. Camshaft gear runout should not exceed 0.004 inches and crankshaft gear run-out should not be above 0.003 inches.

13. Using a dial indicator, check the backlash at several points between the camshaft and crankshaft gear teeth. Backlash should be 0.004-0.006 inches.

14. Install the timing gear cover.

15. Install the distributor.

16. Install the fuel pump.

17. Install the valve lifters and the pushrods.

18. Install the engine.

5.0L and 5.7L Engines

ALL SERIES

1. Disconnect the negative battery cable. Drain the cooling system and properly relieve the fuel system pressure before disconnecting fuel lines.

2. On the Van, remove the engine cover.

3. Remove the air cleaner.

4. On the Van, remove the grille.

5. On the Van, remove the air conditioning condenser, if equipped, and swing the condenser forward from its mounting.

6. Remove the fan, shroud and drain and remove the radiator.

7. Remove the rocker arm covers.

8. Remove the water pump.

9. Remove the torsional damper.

10. Remove the front cover.

11. Disconnect the electrical and vacuum connections.

12. Mark the distributor as to location in the block. Remove the distributor.

13. Remove the intake manifold, pushrods and hydraulic lifters.

14. Remove the fuel pump and pushrod, carbureted engines.

15. Align the timing marks and remove the camshaft sprocket bolts.

16. Remove the camshaft sprocket and timing chain. Tap the sprocket on its lower edge to loosen it.

17. Remove the crankshaft sprocket, as required.

18. Safely raise and support the engine and remove the front engine mount through bolts.

19. Install two or three $\frac{5}{16}$ -18 bolts 4-5 in. long into the camshaft threaded holes to handle the camshaft and

carefully pull the camshaft from the block.

20. Inspect the shaft for signs of excessive wear or damage.

To install:

21. Liberally coat camshaft and bearing with heavy engine oil or engine assembly lubricant and insert the cam into the engine.

22. Lower the engine and install the engine mount through bolts.

23. Align the timing marks on the camshaft and crankshaft gears.

24. Install the camshaft sprocket and chain and tighten the bolts to 18 ft. lbs.

25. Install the fuel pump and pushrod (carbureted engines).

26. Install the hydraulic lifters and pushrods and adjust the valves.

27. Install the distributor.

28. Install the front cover.

29. Install the torsional damper.

30. Install the water pump.

31. Install the rocker arm covers.

32. Install the fan, shroud and radiator.

33. On the Van, install the air conditioning condenser, if equipped.

34. On the Van, install the grille.

35. Install the air cleaner.

36. On the Van, install the engine cover.

37. Connect the battery cable and fill the cooling system.

7.4L Engine

ALL SERIES

1. Disconnect the negative battery cable. Properly relieve the fuel system pressure before disconnecting fuel lines.

2. Remove the air cleaner.

3. Remove the grille.

4. Properly discharge the air conditioning system. Remove the air conditioning condenser.

5. Drain the cooling system.

6. Remove the fan shroud and radiator.

7. Remove the alternator belt, loosen the alternator bolts and move the alternator to one side.

8. Remove the valve covers.

9. Disconnect the hoses from the water pump.

10. Remove the water pump.

11. Remove the harmonic balancer and pulley.

12. Remove the engine front cover.

13. Mark the distributor as to location in the block. Remove the distributor.

14. Remove the intake manifold.

15. Mark the lifters, pushrods, and rocker arms as to location so that they may be installed in the same position. Remove these parts.

16. Rotate the camshaft so that the timing marks align.

17. Remove the camshaft sprocket bolts.

18. Pull the camshaft sprocket and timing chain off. The sprocket is a tight fit, so you have to tap it loose with a plastic mallet.

19. Install two $\frac{5}{16}$ -18 bolts in the holes in the front of the camshaft and carefully pull the camshaft from the block.

To install:

20. Liberally coat camshaft and bearing with heavy engine oil or engine assembly lubricant and insert the cam into the engine.

21. Align the timing marks on the camshaft and crankshaft gears.

22. Install the camshaft sprocket and chain and tighten the bolts to 20 ft. lbs.

23. Install the lifters and pushrods and adjust the valves.

24. Install the intake manifold.

25. Install the distributor using the locating marks made during removal.

26. Install the engine front cover.

27. Install the harmonic balancer and pulley.

28. Install the water pump.

29. Connect the hoses at the water pump.

30. Install the valve covers.

31. Install the alternator.

32. Install the fan shroud and radiator.

33. Fill the cooling system.

34. Install the air conditioning condenser.

35. Install the grille.

36. Install the air cleaner.

37. Connect the battery.

DIESEL ENGINE MECHANICAL

Engine

REMOVAL & INSTALLATION

1986 C/K Series and 1987-90 R/V Series

1. Remove the hood. Disconnect the batteries and remove them from the vehicle.

2. Raise the vehicle and support it safely. Drain the engine oil.

3. Remove the flywheel cover. Disconnect the torque converter from the flexplate. Disconnect the exhaust pipes from the manifolds.

4. Remove the starter bolts and remove the starter. Remove the transmission bell housing to engine bolts, leaving 1 or more loosely to prevent separation.

5. Remove the engine mount bolts.

1. Oil ring rail gaps
2. 2nd Compression ring gap
3. Notch in piston
4. Oil ring spacer gap (tang in hole or slot with arc)
5. Top compression ring gap

Piston ring gap locations—4.3L, 5.0L, 5.7L engines

 - "B" OIL RING RAIL GAPS
 - "C" 2ND COMPRESSION RING GAP
 - "D" TOP COMPRESSION RING GAP

Piston ring gap locations—4.8L engine

Disconnect the block heaters, remove the wiring harness, transmission oil cooler lines and the front battery cable clamp at the oil pan.

6. Lower the vehicle. Properly relieve the fuel pump pressure. Disconnect and plug the fuel lines and the oil cooler lines at the engine block. Remove the lower fan shroud bolts.

7. Drain the engine coolant. Remove the air cleaner assembly. Disconnect the ground cable from the alter-

nator bracket. Disconnect the alternator wires and clips.

8. Disconnect the TPS, EGR-EPR and the fuel cut-off at the injection pump. Remove the harness from the clips at the rocker covers and disconnect the glow plugs.

9. Disconnect the EGR-EPR solenoids, glow plugs, controller, temperature sender and move the harness aside. Disconnect the ground strap on the left side.

10. Remove the fan assembly. Remove the upper radiator hoses at the engine. Remove the fan shroud.

11. Remove the power steering pump and belt. Remove the reservoir and lay the pump and reservoir aside. If equipped with air conditioning, remove the compressor and position it to aside.

12. Disconnect the vacuum lines at the cruise servo and accelerator cable at the injection pump. Disconnect the heater hoses and the oil cooler lines at the engine.

13. Disconnect the lower radiator hose, the oil cooler lines, the heater hose, the automatic transmission cooler lines and the overflow hose at the radiator.

14. Remove the upper radiator cover. Remove the radiator. Remove the detent cable.

15. Install an engine lifting device, remove the loose bolts in the bell housing. Properly support the transmission. Carefully remove the engine from the vehicle.

17. Installation is the reverse of the removal procedure.

1988-90 C/K Series

1. Disconnect the negative battery cable.

2. Raise the vehicle and support it safely.

3. Remove the flywheel or torque converter cover.

4. On vehicles equipped with automatic transmission, remove the converter to flex plate bolts.

5. Disconnect the exhaust pipes from the manifold.

6. Remove the starter.

7. Remove the bell housing bolts.

8. Remove the engine mounting through bolts.

9. Disconnect the block heater wiring.

10. Disconnect the wiring harness, transmission cooler lines, and a battery cable clamp at the oil pan.

11. Disconnect the fuel return lines at the engine.

12. Disconnect the oil cooler lines at the engine.

13. Lower the vehicle.

14. Remove the hood.

15. Drain the cooling system.

16. Remove the air cleaner and cover the mouth of the intake manifold.

17. Remove the alternator wires and clips.

18. Disconnect the wiring at the injector pump.

19. Disconnect the wiring from the rocker cover including the glow plug wires.

20. Disconnect the EGR-EPR solenoids, glow plug controller and temperature solenoid and move the harness aside.

21. Disconnect the left or right ground strap.

22. Remove the upper fan shroud and fan.

23. Disconnect the power steering pump and reservoir and lay to one side.

24. Disconnect the accelerator, cruise control and detent cables at the injection pump.

25. Disconnect the heater hose at the engine.

26. Remove the radiator.

27. Support the transmission with a suitable jack.

28. Remove the engine.

To install:

29. Lower the engine and install the engine mounting bolts. Torque the rear engine mounting to frame bolts or nuts to 45 ft. lbs., the front through bolts to 70 ft. lbs. and the front nuts to 50 ft. lbs.

30. Install the bell housing to engine bolts and torque to 30 ft. lbs.

31. Remove the engine lifting fixture and transmission jack.

32. Raise the vehicle and support it safely.

33. Install the converter to flex bolts and torque to 35 ft. lbs.

34. Install the fuel gauge wiring and starter.

35. Install the flywheel or torque converter cover.

36. Install the starter.

37. Install the exhaust pipes at the manifold.

38. Connect the wiring harness, transmission cooler lines, and a battery cable clamp at the oil pan.

40. Connect the fuel return lines at the engine.

42. Connect the oil cooler lines at the engine.

38. Lower the vehicle.

40. Install the radiator.

41. Install the heater hose to the engine.

42. Connect the accelerator, cruise control and detent cables at the injection pump.

43. Connect the power steering pump and reservoir.

44. Install the fan and the upper fan shroud.

45. Install the ground strap.

46. Connect the wiring to the rocker cover including the glow plug wires.

47. Connect the EGR-EPR solenoids, glow plug controller and temperature solenoid harness.

48. Connect the alternator wires and clips.

49. Connect the wiring at the injector pump.

50. Install the air cleaner.

51. Install the hood.

52. Connect the negative battery cable.

53. Install the proper quantity and grade of coolant.

Van

1. Disconnect the negative battery cable, then the positive battery cable, at the battery. Properly relieve the fuel system pressure.

2. Remove the upper radiator support.

3. Remove the grille.

4. Remove the bumper.

5. Remove the lower grille valance.

6. Remove the hood latch.

7. Drain the cooling system.

8. Remove the radiator coolant reservoir bottle.

9. Remove the radiator support bracket.

10. Remove the radiator and the fan shroud.

11. Remove the engine cover.

12. Remove the air cleaner.

13. Properly discharge the air conditioning system.

14. Remove the air conditioning condenser and cap all openings.

15. Disconnect the air cleaner bracket at the valve cover.

16. Remove the crankcase ventilator bracket and move it aside.

17. Disconnect the secondary fuel filter lines.

18. Remove the secondary fuel filter adapter.

19. Loosen the vacuum pump holddown clamp and rotate the pump in order to gain access to the intake manifold bolt.

20. Remove the intake manifold bolts. The injection line clips are retained by the same bolts.

21. Remove the injection line clips at the loom brackets.

22. Remove the injection lines at the nozzles and cover the nozzles with protective caps.

23. Remove the injection lines at the pump and tag the lines for later installation.

24. Remove the fuel line from the injection pump.

25. Disconnect the alternator cable at the injection pump, and the detent cable where applicable.

26. Tag and disconnect the necessary wires and hoses at the injection pump.

27. Remove the air conditioning hose retainer bracket if equipped with air conditioning.

28. Remove the oil fill tube, including the crankcase depression valve vent hose assembly.

29. Remove the grommet.

30. Scribe or paint a matchmark on the front cover and on the injection pump flange.

31. The crankshaft must be rotated in order to gain access to the injection pump drive gear bolts through the oil filler neck hole.

32. Remove the injection pump-to-front cover attaching nuts.

33. Remove the pump and cap all open lines and nozzles.

34. Remove the intake manifold.

35. Raise and support the vehicle safely.

36. Disconnect the exhaust pipes at the manifolds.

37. Lower the vehicle. Disconnect the radiator hoses at the radiator.

38. If the vehicle is equipped with an automatic transmission, remove the fluid cooler lines from the radiator.

39. Remove the windshield wiper jar and bracket.

40. Disconnect the engine wiring harness from the firewall connection.

41. Disconnect the heater hoses at the engine.

42. Remove the oil filler pipe.

43. Remove the engine dipstick tube.

44. Remove the cruise control servo, servo bracket and transducer.

45. Remove the glow plug relay.

46. Remove the alternator upper bracket.

47. Remove the coolant crossover/thermostat assembly.

48. Disconnect the block heater wires.

49. Remove the coolant hose at the intake manifold.

50. Remove the transmission dipstick tube and the accelerator cable.

51. Remove the air conditioning idler pulley.

52. Remove the lower fan shroud and filler panel.

53. Raise the vehicle and support it safely.

54. Drain the engine oil.

55. Remove the fuel line from the fuel tank and at the fuel pump.

56. Remove the driveshaft and plug the end of the transmission.

57. Disconnect the transmission shift linkage.

58. Disconnect the speedometer cable.

59. Remove the transmission mounting bolts.

60. Remove the engine mount bracket-to-frame bolts.

61. Remove the engine mount through bolts.

62. Raise the engine slightly and remove the engine mounts. Support the engine with wood between the oil pan and the crossmember.

63. Remove the engine and transmission as 1 unit.

64. Remove the manual transmission and clutch as follows:

a. Remove the clutch housing rear bolts.

b. Remove the bolts attaching the clutch housing to the engine and remove the transmission and clutch as a unit.

NOTE: Support the transmission as the last bolt is being removed to prevent damaging the clutch.

c. Remove the starter and clutch housing rear cover.

d. Loosen the clutch mounting bolts a little at a time to prevent distorting the disc until spring pressure is released. Remove all of the bolts, the clutch disc and the pressure plate.

65. Remove the automatic transmission as follows:

a. Lower the engine and support it on blocks.

b. Remove the starter and converter housing underpan.

c. Remove the flywheel-to-converter attaching bolts.

d. Support the transmission on blocks.

e. Disconnect the throttle linkage and the detent cable on the Turbo Hydra-Matic.

f. Remove the transmission-to-engine mounting bolts.

g. Remove the blocks from the engine only and glide the engine away from the transmission.

To install:

66. Raise the engine into position.

67. Raise the engine slightly and install the engine mounts. Torque the bolts to 36 ft. lbs.

68. Install the manual transmission and clutch as follows:

a. Install the clutch disc and the pressure plate. Tighten the clutch mounting bolts a little at a time to prevent distorting the disc.

b. Install the starter and clutch housing rear cover.

c. Install the bolts attaching the clutch housing to the engine and install the transmission and clutch as a unit. Torque the bolts to 30 ft. lbs.

d. Install the clutch housing rear bolts.

69. Install the automatic transmission as follows:

a. Position the transmission.

b. Install the transmission-to-engine mounting bolts. Torque the bolts to 30 ft. lbs.

c. Connect the throttle linkage and the detent cable on the Turbo Hydra-Matic.

d. Install the flywheel-to-converter attaching bolts. Torque the bolts to 40 ft. lbs.

e. Install the starter and converter housing underpan.

70. Install the engine mount through bolts. Torque the bolt to 75 ft. lbs.

71. Install the engine mount bracket-to-frame bolts. Torque the bolts to 40 ft. lbs. and the nuts to 30 ft. lbs.

72. Install the clutch cross-shaft.

73. Install the transmission mounting bolts. Torque the bolts to 36 ft. lbs.

74. Connect the transmission shift linkage.

75. Connect the speedometer cable.

76. Install the driveshaft.

77. Install the condenser.

78. Install the hood latch support.

79. Install the lower fan shroud and filler panel.

80. Install the air conditioning idler pulley.

81. Install the transmission dipstick tube and the accelerator cable.

82. Replace the injection pump gasket.

83. Align the locating pin on the pump hub with the slot in the injection pump driven gear. At the same time, align the timing marks.

84. Attach the injection pump to the front cover, aligning the timing marks before torquing the nuts to 30 ft. lbs.

85. Install the drive gear to injection pump bolts, torquing the bolts to 20 ft. lbs.

86. The crankshaft must be rotated in order to gain access to the injection pump drive gear bolts through the oil filler neck hole.

87. Install the air conditioning hose retainer bracket if equipped with air conditioning.

88. Connect the fuel feed line at the injection pump. Torque the fuel feed line at the injection pump to 20 ft. lbs.

89. Connect the fuel return line at the top of the injection pump.

90. Connect the necessary wires and hoses at the injection pump.

91. Connect the alternator cable at the injection pump, and the detent cable where applicable.

92. Install the intake manifold.

93. Install the fuel line at the injection pump.

94. Install the injection lines at the pump.

95. Install the injection lines at the nozzles.

96. Install the injection line clips at the loom brackets.

97. Install the secondary fuel filter adapter.

98. Connect the secondary fuel filter lines.

99. Install the crankcase ventilator bracket.
100. Connect the air cleaner bracket at the valve cover.
101. Connect the coolant hose at the intake manifold.
102. Install the cruise control servo, servo bracket and transducer.
103. Install the oil filler pipe.
104. Install the engine dipstick tube.
105. Install the glow plug relay.
106. Install the alternator upper bracket.
107. Install the coolant crossover/thermostat assembly.
108. Connect the block heater wires.
109. Connect the heater hoses at the engine.
110. Connect the engine wiring harness at the firewall connection.
111. Install the radiator and the shroud.
112. Install the radiator support bracket.
113. Install the windshield wiper jar and bracket.
114. Install the air conditioning vacuum reservoir.
115. Properly charge the air conditioning system.
116. If the vehicle is equipped with an automatic transmission, install the fluid cooler lines at the radiator.
117. Install the radiator coolant reservoir bottle.
118. Connect the radiator hoses at the radiator.
119. Install the upper radiator support.
120. Install the grille.
121. Install the lower grille valance.
122. Install the air cleaner.
123. Install the engine cover.
124. Fill the cooling system.
125. Connect the battery cables.

Cylinder Head

REMOVAL & INSTALLATION

Right Side

1. Disconnect the negative battery cable, relieve the fuel system pressure and drain the coolant system. Remove the intake manifold.
2. Remove the fuel injection lines.
3. Remove the cruise control transducer.
4. Remove the upper fan shroud.
5. Remove the air conditioning compressor belt.
6. Remove the exhaust manifold.
7. Disconnect and label the glow plug wiring.
8. Remove the oil dipstick tube.
9. Remove the oil fill tube upper bracket.
10. Remove the rocker arm cover(s), after removing any accessory brackets

which interfere with cover removal.

11. Remove the rocker arm assemblies. It is a good practice to number or mark the parts to avoid interchanging them.
12. Remove the pushrods. Keep them in order.
13. Remove the air cleaner resonator and bracket.
14. Remove the automatic transmission dipstick and tube.
15. Drain the cooling system.
16. Disconnect the heater hoses at the head.
17. Disconnect the upper radiator hose.
18. Disconnect the bypass hose.
19. Remove the alternator upper bracket.
20. Remove the coolant crossover pipe and thermostat.
21. Remove the head bolts.
22. Remove the cylinder head.

To install:

23. Clean the mating surfaces of the head and block thoroughly.
24. Install a new head gasket on the engine block. Do not coat the gaskets with any sealer on either engine. The gaskets have a special coating that eliminates the need for sealer. The use of sealer will interfere with this coating and cause leaks. Install the cylinder head onto the block.
25. Clean the head bolts thoroughly. The left rear head bolt must be installed into the head prior to head installation. Coat the threads and heads of the head bolts with sealing compound GM part No. 1052080 or equivalent, before installation. Tighten the head bolts to 20 ft. lbs. in the proper sequence, next tighten all bolts to 50 ft. lbs in the proper sequence, and finally tighten all bolts an additional 90 degrees (1/4 turn).
26. Install the coolant crossover pipe and thermostat.
27. Install the alternator upper bracket.
28. Connect the bypass hose.
29. Connect the upper radiator hose.
30. Connect the heater hoses at the head.
31. Install the automatic transmission dipstick and tube.
32. Install the air cleaner resonator and bracket.
33. Install the pushrods.
34. Install the rocker arm assemblies.
35. Adjust the valves.
36. Install the rocker arm cover.
37. Install the oil fill tube upper bracket.
38. Install the oil dipstick tube.
39. Connect the glow plug wiring.
40. Install the exhaust manifold.
41. Install the air conditioning compressor belt.

42. Install the upper fan shroud.
43. Install the cruise control transducer.
44. Install the fuel injection lines.
45. Install the intake manifold.
46. Fill the cooling system.

Left Side

1. Remove the intake manifold.
2. Remove the fuel injection lines.
3. Remove the cruise control transducer.
4. Remove the upper fan shroud.
5. Remove the air conditioning compressor belt.
6. Remove the exhaust manifold.
7. Remove the power steering pump lower adjusting bolts.
8. Disconnect and label the glow plug wiring.
9. Remove the air conditioning compressor and position it out of the way. Do not disconnect any refrigerant lines.
10. Remove the power steering pump and position it out of the way. Do not disconnect the fluid lines.
11. Remove the oil dipstick tube.
12. Disconnect the transmission detent cable.
13. Remove the glow plug controller and bracket.
14. Remove the rocker arm cover(s), after removing any accessory brackets which interfere with cover removal.
15. Remove the rocker arm assemblies. It is a good practice to number or mark the parts to avoid interchanging them.
16. Remove the pushrods. Keep them in order.
17. Remove the air cleaner resonator and bracket.
18. Remove the automatic transmission dipstick and tube.
19. Drain the cooling system.
20. Remove the alternator upper bracket.
21. Remove the coolant crossover pipe and thermostat.
22. Remove the head bolts.
23. Remove the cylinder head.

To install:

24. Clean the mating surfaces of the head and block thoroughly.
25. Install a new head gasket on the engine block. Do NOT coat the gaskets with any sealer on either engine. The gaskets have a special coating that eliminates the need for sealer. The use of sealer will interfere with this coating and cause leaks. Install the cylinder head onto the block.
26. Clean the head bolts thoroughly. The left rear head bolt must be installed into the head prior to head installation. Coat the threads and heads of the head bolts with sealing compound (GM part #1052080 or equivalent) before installation. Tighten the

head bolts as explained in the Torque Specifications Chart.

27. Install the coolant crossover pipe and thermostat.

28. Install the alternator upper bracket.

29. Install the automatic transmission dipstick and tube.

30. Install the air cleaner resonator and bracket.

31. Install the pushrods.

32. Install the rocker arm assemblies.

33. Adjust the valves.

34. Install the rocker arm cover(s).

35. Install the oil fill tube upper bracket.

36. Install the oil dipstick tube.

37. Connect the glow plug wiring.

38. Install the compressor.

39. Install the power steering pump.

40. Install the glow plug controller.

41. Install the exhaust manifold.

42. Connect the detent cable.

43. Install the air conditioning compressor belt.

44. Install the upper fan shroud.

45. Install the cruise control transducer.

46. Install the fuel injection lines.

47. Install the intake manifold.

48. Fill the cooling system.

Valve Lash

ADJUSTMENT

All engines use hydraulic lifters, which require no periodic adjustment.

Rocker Arm

REMOVAL & INSTALLATION

1. Disconnect the negative battery cables. On the Van, remove the engine cover.

2. Remove all the necessary components in order to gain access to the engine valve covers. As required, properly relieve the fuel system pressure before disconnecting any fuel lines.

3. Remove the valve cover retaining bolts. Remove the valve cover from the engine.

4. Remove the rocker arm assemblies. Keep them in order for reinstallation.

5. Installation is the reverse of the removal procedure. Be sure to use new gaskets or RTV sealant, as necessary.

Intake Manifold

REMOVAL & INSTALLATION

1986 C/K Series and 1987-90 R/V Series

1. Disconnect both batteries.

Cylinder head bolt torque sequence—6.2L diesel engine

2. Drain the cooling system and properly relieve the fuel system pressure. Remove the air cleaner assembly.

3. Remove the crankcase ventilator tubes, and disconnect the secondary fuel filter lines. Remove the secondary filter and adaptor.

4. Loosen the vacuum pump holddown clamp and rotate the pump to gain access to the nearest manifold bolt.

5. Remove the EPR/EGR valve bracket, if equipped.

6. Remove the rear air conditioning bracket, if equipped.

7. Remove the intake manifold bolts. The injection line clips are retained by these bolts.

8. Remove the intake manifold.

NOTE: If the engine is to be further serviced with the manifold removed, install protective covers over the intake ports.

To install:

9. Clean the manifold gasket surfaces on the cylinder heads and install new gaskets before installing the manifold.

NOTE: The gaskets have an opening for the EGR valve on light duty installations. An insert covers this opening on heavy duty installations.

10. Install the manifold. Torque the bolts in the proper sequence and to the correct specification.

11. The secondary filter must be filled with clean diesel fuel before it is reinstalled.

12. Install the rear air conditioning bracket, if equipped.

13. Install the EPR/EGR valve bracket, if equipped.

14. Tighten the vacuum pump holddown clamp.

15. Install the secondary filter and adaptor.

16. Connect the secondary fuel filter lines.

17. Install the crankcase ventilator tubes.

18. Install the air cleaner assembly.

19. Connect both batteries.

1988-90 C/K Series

1. Disconnect both batteries.

2. Drain the cooling system and properly relieve the fuel system pressure. Remove the air cleaner assembly.

3. Remove the crankcase ventilator tubes, and disconnect the secondary fuel filter lines. Remove the secondary filter and adaptor.

4. Loosen the vacuum pump holddown clamp and rotate the pump to gain access to the nearest manifold bolt.

5. Remove the EPR/EGR valve bracket, if equipped.

6. Remove the rear air conditioning bracket, if equipped.

7. Remove the intake manifold bolts. The injection line clips are retained by these bolts.

8. Remove the intake manifold.

NOTE: If the engine is to be further serviced with the manifold removed, install protective covers over the intake ports.

1. Hydraulic lifter

2. Pushrod

3. Bolt

4. Rocker arm assembly

5. Clamp

6. Guide plate

Cylinder head and components—6.2L diesel engine

LEFT SIDE

RIGHT SIDE

Intake manifold installation and torque sequence—6.2L diesel engine

To install:

9. Clean the manifold gasket surfaces on the cylinder heads and install new gaskets before installing the manifold.

NOTE: The gaskets have an opening for the EGR valve on light duty installations. An insert covers this opening on heavy duty installations.

10. Install the manifold. Torque the bolts in the proper sequence and to the correct specification.

11. The secondary filter must be filled with clean diesel fuel before it is reinstalled.

12. Install the rear air conditioning bracket, if equipped.

13. Install the EPR/EGR valve bracket, if equipped.

14. Tighten the vacuum pump holddown clamp.

15. Install the secondary filter and adaptor.

16. Connect the secondary fuel filter lines.

17. Install the crankcase ventilator tubes.

18. Install the air cleaner assembly.

19. Connect both batteries.

Van

1. Disconnect both batteries.

2. Drain the cooling system and properly relieve the fuel system pressure. Remove the air cleaner assembly.

3. Remove the crankcase ventilator tubes, and disconnect the secondary fuel filter lines. Remove the secondary filter and adaptor.

4. Loosen the vacuum pump holddown clamp and rotate the pump to gain access to the nearest manifold bolt.

5. Remove the EPR/EGR valve bracket, if equipped.

6. Remove the rear air conditioning bracket, if equipped.

7. Remove the intake manifold bolts. The injection line clips are retained by these bolts.

8. Remove the intake manifold.

NOTE: If the engine is to be further serviced with the manifold removed, install protective covers over the intake ports.

To install:

9. Clean the manifold gasket surfaces on the cylinder heads and install new gaskets before installing the manifold.

NOTE: The gaskets have an opening for the EGR valve on light duty installations. An insert covers this opening on heavy duty installations.

10. Install the manifold. Torque the bolts in the proper sequence and to the correct specification.

11. The secondary filter must be filled with clean diesel fuel before it is reinstalled.

12. Install the rear air conditioning bracket, if equipped.

13. Install the EPR/EGR valve bracket, if equipped.

14. Tighten the vacuum pump holddown clamp.

15. Install the secondary filter and adaptor.

16. Connect the secondary fuel filter lines.

17. Install the crankcase ventilator tubes.

18. Install the air cleaner assembly.

19. Connect both batteries.

Exhaust Manifold REMOVAL & INSTALLATION

1986 C/K Series and 1987-90 R/V Series

RIGHT SIDE

1. Disconnect the batteries.

2. Raise and support the vehicle safely.

3. Disconnect the exhaust pipe from the manifold flange and lower the vehicle.

4. Disconnect the glow plug wires.

5. Remove the air cleaner duct bracket.

6. Remove the glow plug wires.

7. Remove the manifold bolts and remove the manifold.

8. To install, reverse the above procedure and torque the bolts to specifications.

LEFT SIDE

1. Disconnect the batteries.

2. Remove the dipstick tube nut, and remove the dipstick tube.

3. Disconnect the glow plug wires.

4. Remove the air conditioner compressor rear bracket, if so equipped.

5. Raise and support the vehicle safely.

6. Disconnect the exhaust pipe at the manifold flange.

7. Remove the manifold bolts. Remove the manifold from underneath the vehicle.

8. Reverse the above procedure to install. Start the manifold bolts while the vehicle is raised. Torque the bolts to specifications.

1988-90 C/K Series

RIGHT SIDE

1. Disconnect the batteries.

2. Raise and support the vehicle safely.
3. Disconnect the exhaust pipe from the manifold flange and lower the vehicle.
4. Disconnect the glow plug wires.
5. Remove the air cleaner duct bracket.
6. Remove the glow plug wires.
7. Remove the manifold bolts and remove the manifold.
8. To install, reverse the above procedure and torque the bolts to 26 ft. lbs.

LEFT SIDE

1. Disconnect the batteries.
2. Remove the dipstick tube nut, and remove the dipstick tube.
3. Disconnect the glow plug wires.
4. Raise and support the vehicle safely.
5. Disconnect the exhaust pipe at the manifold flange.
6. Remove the manifold bolts. Remove the manifold from underneath the vehicle.
7. Reverse the above procedure to install. Start the manifold bolts while the vehicle is raised. Torque the bolts to 26 ft. lbs.

Van

1. Disconnect the batteries.
2. Raise and support the vehicle safely.
3. Disconnect the exhaust pipe from the manifold flange and lower the vehicle.
4. Remove the engine cover and disconnect the glow plug wires.
5. Remove the air cleaner duct bracket.
6. Remove the glow plug wires.
7. Remove the air conditioner compressor rear bracket, if so equipped.
8. Remove the manifold bolts and remove the manifold.
9. To install, reverse the above procedure and torque the bolts to 26 ft. lbs.

Timing Chain Cover and Front Oil Seal

REMOVAL & INSTALLATION

1. Disconnect both negative battery cables. Drain the cooling system.
2. Remove the water pump.
3. Rotate the crankshaft to align the marks on the injection pump driven gear and the camshaft gear.
4. Scribe a mark aligning the injection pump flange and the front cover.
5. Remove the crankshaft pulley and torsional damper.
6. Remove the front cover-to-oil pan bolts (4).

7. Remove the 2 fuel return line clips.
8. Remove the injection pump gear.
9. Remove the injection pump retaining nuts from the front cover.
10. Remove the baffle. Remove the remaining cover bolts, and remove the front cover.
11. If the front cover oil seal is to be replaced, it can now be pried out of the cover with a suitable prying tool. Press the new seal into the cover evenly.

NOTE: The oil seal can also be replaced with the front cover installed. Remove the torsional damper first, then pry the old seal out of the cover using a suitable prying tool. Use care not to damage the surface of the crankshaft. Install the new seal evenly into the cover and install the damper.

12. To install the front cover, first clean both sealing surfaces until all traces of old sealer are gone. Apply a 2mm bead of sealant (GM sealant No. 1052357 or equivalent) to the sealing surface. Apply a bead of RTV type sealer to the bottom portion of the front cover which attached to the oil pan. Install the front cover.

13. Install the baffle.

14. Install the injection pump, making sure the scribe marks on the pump and front cover are aligned. Tighten the nuts to 31 ft. lbs.

15. Install the injection pump driven gear, making sure the marks on the cam gear and pump are aligned. Be sure the dowel pin and the three holes on the pump flange are also aligned. Torque the injection pump gear bolts to 17 ft. lbs.

16. Install the fuel line clips, the front cover-to-oil bolts, and the torsional damper and crankshaft pulley. Torque the pan bolts to 4-7 ft. lbs., and the damper bolt to 200 ft. lbs.

Timing Chain

REMOVAL & INSTALLATION

1. Disconnect the negative battery cables. Remove the front cover.
2. Remove the bolt and washer attaching the camshaft gear. Remove the injection pump gear.
3. Remove the camshaft sprocket, timing chain and crankshaft sprocket as a unit.

To install:

4. Install the cam sprocket, timing chain and crankshaft sprocket as a unit, aligning the timing marks on the sprockets.

5. Rotate the crankshaft 360 degrees so that the camshaft gear and the injection pump gear are aligned.

1. Timing marks
2. Camshaft gear
3. Camshaft sprocket
4. Crankshaft sprocket

Camshaft and sprockets—6.2L diesel engine

6. Install the front cover. The injection pump must be retimed since the timing chain assembly was removed.

Camshaft

REMOVAL & INSTALLATION

1986 C/K Series and 1987-90 R/V Series

1. Disconnect the battery cables.
2. Drain the cooling system.
3. Remove the radiator shrouds and fan.
4. Remove the vacuum pump.
5. Remove the power steering pump.
6. Remove the alternator.
7. Remove the air conditioning compressor without disconnecting the freon hoses and position to one side.
8. Remove the rocker arm covers.
9. Remove the rocker arm assemblies and pushrods. Mark them so they can be returned to their original position.
10. Remove the hydraulic lifters and keep them in order so they can be returned to their original bore.
11. Remove the front cover.
12. Remove the fuel pump.
13. Disconnect the air conditioning condenser mounting bolts and lift the condenser out of the way.
14. Remove the timing chain and camshaft sprocket.
15. Raise the engine and support it safely.
16. Remove the front engine mounting through bolts.
17. Remove the bolts and thrust plate.
18. Carefully remove the camshaft from the block.
19. Remove the spacer, if necessary.

To install:

20. Install the spacer with the ID chamfer toward the camshaft.

NOTE: It is recommended that the engine oil, oil filter and hydraulic lifters be replaced when installing a new camshaft.

21. Coat the camshaft lobes with Molykote, or equivalent.

22. Lubricate the camshaft journals with engine oil.

23. Insert the camshaft carefully into the block, install the thrust plate and bolts and torque to 17 ft. lbs.

24. Lower the engine and install the engine through mounting bolts.

25. Align the timing marks and install the timing chain and sprockets.

26. Install the air conditioner condensor, if so equipped.

27. Install the fuel pump.

28. Install the front cover.

29. Install the hydraulic lifters in the same bore as they were removed.

30. Install the rocker arm assemblies and pushrods in their original locations.

31. Install the rocker arm covers.

32. Install the air conditioner compressor.

33. Install the alternator.

34. Install the power steering pump.

35. Install the vacuum pump.

36. Install the fan, radiator and shrouds.

37. Install the battery cables.

38. Fill the cooling system.

1988-90 C/K Series

1. Disconnect the battery cables and relieve the fuel system pressure.

2. Drain the cooling system.

3. Remove the radiator shrouds and fan.

4. Remove the grille and parking lamp assembly.

5. Remove the hood latch and brace.

6. Remove the oil pump drive.

7. Remove the power steering pump, alternator and air conditioner compressor and move to one side out of the way.

8. Remove the rocker arm covers.

9. Remove the rocker arm assemblies and pushrods. Mark them so they can be returned to their original position.

10. Remove the hydraulic lifters and keep them in order so they can be returned to their original bore.

11. Remove the front cover.

14. Remove the timing chain and camshaft sprocket.

15. Remove the fuel pump.

16. Raise the engine and support it safely.

17. Remove the front engine mounting through bolts.

18. Remove the air conditioner condensor mounting bolts and lift the condensor out.

19. Remove the bolts and thrust plate.

20. Carefully remove the camshaft from the block.

21. Remove the spacer, if necessary.

To install:
22. Install the spacer with the ID chamfer toward the camshaft.

NOTE: It is recommended that the engine oil, oil filter and hydraulic lifters be replaced when installing a new camshaft.

23. Coat the camshaft lobes with Molykote, or equivalent.

24. Lubricate the camshaft journals with engine oil.

25. Insert the camshaft carefully into the block, install the thrust plate and bolts and torque to 17 ft. lbs.

26. Lower the engine and install the engine through mounting bolts.

27. Align the timing marks and install the timing chain and sprockets.

28. Install the air conditioner condensor, if so equipped.

29. Install the fuel pump.

30. Install the front cover.

31. Install the hydraulic lifters in the same bore as they were removed.

32. Install the rocker arm assemblies and pushrods in their original locations.

33. Install the rocker arm covers.

34. Install the power steering pump, alternator and air conditioner compressor.

35. Install the oil pump drive.

36. Install the hood latch and brace.

37. Install the grille and parking lamp assembly.

38. Install the radiator shrouds and fan.

39. Fill the cooling system.

40. Connect the battery cables.

Van

1. Disconnect the battery cables and relieve the fuel system pressure.

2. Remove the headlight bezels.

3. Remove the grille, bumper and lower valence panel.

4. Remove the hood latch.

5. Remove the coolant recovery bottle.

6. Remove the upper tie bar.

7. Remove the air conditioner compressor.

8. Drain the cooling system and remove the radiator and fan.

9. Remove the oil pump drive.

10. Remove the cylinder heads.

11. Remove the alternator lower bracket.

12. Remove the water pump.

13. Remove the torsional damper.

14. Remove the front cover.

15. Remove the fuel pump.

16. Remove the rocker arm covers.

17. Remove the rocker arm assemblies and pushrods. Mark them so they can be returned to their original position.

18. Remove the hydraulic lifters and keep them in order so they can be returned to their original bore.

19. Remove the timing chain and camshaft sprocket.

20. Remove the bolts and thrust plate.

21. Carefully remove the camshaft from the block.

22. Remove the spacer, if necessary.

To install:
23. Install the spacer with the ID chamfer toward the camshaft.

NOTE: It is recommended that the engine oil, oil filter and hydraulic lifters be replaced when installing a new camshaft.

24. Coat the camshaft lobes with Molykote, or equivalent.

25. Lubricate the camshaft journals with engine oil.

26. Insert the camshaft carefully into the block, install the thrust plate and bolts and torque to 17 ft. lbs.

27. Align the timing marks and install the timing chain and sprockets.

28. Install the hydraulic lifters in the same bore as they were removed.

29. Install the rocker arm assemblies and pushrods in their original locations.

Piston and Connecting Rod

POSITIONING

1. Oil control ring expander gap
2. Second compression ring gap
3. Centerline of piston pin
4. Oil control ring gap
5. Top compression ring gap

Piston ring gap locations — 6.2L diesel engine

30. Install the rocker arm covers.
31. Install the fuel pump.
32. Install the front cover.
33. Install the torsional damper and water pump.
34. Install the alternator lower bracket.
35. Install the cylinder head.
36. Install the oil pump drive.
37. Install the radiator and fan.
38. Install the air conditioner compressor.
39. Install the upper tie bar.
40. Install the coolant recovery bottle.
41. Install the hood latch.
42. Install the grille, bumper and lower valence panel.
43. Install the headlight bezels.
44. Install the battery cables.
45. Fill the cooling system.
46. Evacuate and charge the air conditioner system.

ENGINE LUBRICATION

Oil Pan

REMOVAL & INSTALLATION

4.8L Engine

1. Disconnect the negative battery cable. Raise the vehicle and support it safely. Drain the engine oil.
2. Remove the flywheel cover. Remove the starter assembly.
3. Remove the engine mount through bolts from the engine front mounts. Raise the engine enough to remove the oil pan.
4. Remove the oil pan retaining bolts. Remove the oil pan from the engine.
5. Installation is the reverse of the removal procedure. Use new gaskets or RTV sealant, as required. Torque the pan to front cover bolts to 45 inch lbs. Torque the $\frac{1}{4}$ in. pan to block bolts to 80 in. lbs. and the $\frac{5}{16}$ in. bolts to 165 inch lbs.

4.3L Engine

- A one piece type oil pan gasket is used.
1. Disconnect the negative battery cable. Raise the vehicle, support it safely, and drain the engine oil.
 2. Remove the exhaust crossover pipe.
 3. Remove the torque converter cover (on models with automatic transmission).
 4. Remove the strut rods at the flywheel cover.

1. Gasket
2. Reinforcement

Oil pan assembly - 5.0L, 5.7L engines

5. Remove the strut rod brackets at the front engine mountings.
 6. Remove the starter.
 7. Remove the oil pan bolts, nuts and reinforcements.
 8. Remove the oil pan and gaskets.
- To install:**
9. Thoroughly clean all gasket surfaces and install a new gasket, using only a small amount of sealer at the front and rear corners of the oil pan.
 10. Install the oil pan and new gaskets.
 11. Install the oil pan bolts, nuts and

- reinforcements. Torque the pan bolts to 100 inch lbs. and the oil pan nuts at corners to 200 inch lbs.
12. Install the starter.
13. Install the strut rod brackets at the front engine mountings.
14. Install the strut rods at the flywheel cover.
15. Install the torque converter cover (on models with automatic transmission).
16. Install the exhaust crossover pipe.
17. Connect the negative battery cable.
18. Fill the crankcase.

5.0L and 5.7L Engines

1. Disconnect the negative battery cable. Raise the vehicle, support it safely, and drain the engine oil.
2. Remove the exhaust crossover pipe.
3. Remove the flywheel or torque converter cover.
4. Remove the strut rods at the front engine mountings, if used.
5. Remove the oil pan bolts, nuts and reinforcements.
6. Remove the oil pan and gaskets.

To install:

7. Thoroughly clean all gasket surfaces and install a new gasket, using only a small amount of sealer at the front and rear corners of the oil pan.
9. Install the oil pan and new gaskets.
10. Install the oil pan bolts, nuts and reinforcements. Torque the pan bolts to 100 inch lbs. and the oil pan nuts at corners to 200 inch lbs.
11. Install the strut rods at the front engine mountings.
12. Install the torque converter or flywheel cover.
13. Install the exhaust crossover pipe.
14. Connect the negative battery cable.

1. Gasket
2. Reinforcement

Oil pan assembly - 4.3L engine

15. Fill the crankcase.

6.2L Diesel Engine

1986 C/K SERIES AND 1987-90 R/V SERIES

1. Disconnect the battery cables.
2. Raise the vehicle and support it safely.
3. Drain the engine oil.
4. Remove the flywheel cover.
5. Raise the engine and remove the left engine mounting through bolt.
6. Remove the oil pan bolts and remove the oil pan.
7. Remove the oil pan rear seal.
8. To install clean the old RTV sealant from the oil pan and block.
9. Apply a $\frac{3}{16}$ in. bead of RTV sealant to the oil pan sealing surface, inboard of the bolt holes. The sealant must be wet to the touch when the oil pan is to be installed.
10. Install the oil pan rear seal.
11. Install the oil pan to the engine and install the retaining bolts. Torque all except the rear 2 bolts to 84 inch lbs. Torque the rear 2 bolts to 17 ft. lbs.

NOTE: Be sure to connect the oil dipstick.

12. Lower the engine.
13. Install the engine mounting through bolt and nut.
14. Install the flywheel cover and lower the vehicle.
15. Refill with the proper grade and quantity of oil.
16. Install the battery cables.

1988-90 C/K SERIES

1. Disconnect the battery cables.
2. Raise the vehicle and support it safely.
3. Drain the engine oil.
4. Remove the flywheel cover.
5. Disconnect the exhaust pipes from the manifolds.
6. Raise the engine and remove the front engine mounting through bolts.
7. Remove the oil pan bolts and remove the oil pan.
8. Remove the oil pan rear seal.
9. To install clean the old RTV sealant from the oil pan and block.
10. Apply a $\frac{3}{16}$ in. bead of RTV sealant to the oil pan sealing surface, inboard of the bolt holes. The sealant must be wet to the touch when the oil pan is to be installed.
11. Install the oil pan rear seal.
12. Install the oil pan to the engine and install the retaining bolts. Torque all except the rear 2 bolts to 84 inch lbs. Torque the rear 2 bolts to 17 ft. lbs.
13. Lower the engine.
14. Install the engine mounting through bolt and nut.

15. Install the exhaust pipes to the manifolds.

16. Install the flywheel cover and lower the vehicle.

17. Refill with the proper grade and quantity of oil.

18. Install the battery cables.

VAN

1. Disconnect the battery cables.
2. Remove the engine cover.
3. Remove the engine oil dipstick.
4. Remove the engine oil dipstick tube at the rocker cover.
5. Raise the vehicle and support it safely.
6. Disconnect the transmission.
7. Drain the engine oil.
8. Disconnect the oil cooler lines at the block.
9. Remove the starter.
10. Remove the oil pan bolts and remove the oil pan and oil pan rear seal.

To install:

11. Apply a $\frac{3}{16}$ in. bead of RTV sealant to the oil pan sealing surface, inboard of the bolt holes. The sealant must be wet to the touch when the oil pan is to be installed.
12. Install the oil pan rear seal.
13. Install the oil pan to the engine and install the retaining bolts. Torque all except the rear 2 bolts to 84 inch lbs. Torque the rear 2 bolts to 17 ft. lbs.
14. Install the starter.
15. Install the engine oil cooler lines.
16. Connect the transmission.
17. Lower the vehicle.
18. Install the engine oil dipstick tube at the rocker cover.
19. Install the engine oil dipstick.
20. Install the engine cover.
21. Refill with the proper grade and quantity of oil.
22. Install the battery cables.

7.4L Engine

1. Disconnect the negative battery cable.
2. Remove the fan shroud.
3. Remove the air cleaner.
4. Remove the distributor cap.
5. Raise and support the vehicle safely.
6. Drain the engine oil.
7. Remove the converter housing pan.
8. Remove the oil filter.
9. Remove the oil pressure line.
10. Support the engine with a floor jack.
11. Remove the engine mounting through bolts.
12. Raise the engine just enough to remove the pan.
13. Remove the oil pan and discard the gaskets.

To install:

14. Clean all mating surfaces thoroughly.
15. Apply RTV gasket material to the front and rear corners of the gaskets.
16. Coat the gaskets with adhesive sealer and position them on the block.
17. Install the rear pan seal in the pan with the seal ends mating with the gaskets.
18. Install the front seal on the bottom of the front cover, pressing the locating tabs into the holes in the cover.
19. Install the oil pan.
20. Install the pan bolts, clips and reinforcements. Torque the pan-to-cover bolts to 70 inch lbs.; the pan-to-block bolts to 13 ft. lbs.
21. Lower the engine onto the mounts.
22. Install the engine mount through-bolts.
23. Install the oil pressure line.
24. Install the oil filter.
25. Install the converter housing pan.
26. Install the distributor cap.
27. Install the air cleaner.
28. Install the fan shroud.
29. Connect the battery.
30. Fill the crankcase.

Oil Pump

REMOVAL & INSTALLATION

4.8L Engine

1. Raise and support the vehicle safely.
2. Remove the oil pan.
3. Remove the oil pump tube bracket main bearing cap nut.
4. Remove the oil pump bolts and the oil pump.

To install:

5. Position the oil pump to the engine and align the slot in the oil pump shaft with the tang on the distributor shaft. The oil pump should slide easily in place.
6. Install the oil pump bolts and tighten to 115 inch lbs.
7. Install the oil pump pick-up tube to the main bearing cap nut and tighten to 25 ft. lbs.
8. Install the oil pan.

4.3L, 5.0L, 5.7L and 7.4L Engines

1. Raise and support the vehicle safely and remove the oil pan.
2. Remove the bolt attaching the pump to the rear main bearing cap. Remove the pump and the extension shaft, which will come out behind it.
3. If the pump has been disassembled, is being replaced, or for any reason oil has been removed from it, it must be primed. It can either be filled

with oil before installing the cover plate (and oil kept within the pump during handling), or the entire pump cavity can be filled with petroleum jelly.

NOTE: If the pump is not primed, the engine could be damaged before it receives adequate lubrication when the engine is started.

4. Engage the extension shaft with the oil pump shaft. Align the slot on the top of the extension shaft with the drive tang on the lower end of the distributor driveshaft, and then position the pump at the rear main bearing cap so the mounting bolt can be installed. Install the bolt, torquing to 65 ft. lbs.
5. Install the oil pan.

6.2L Diesel Engine

1. Raise and support the vehicle safely. Drain the oil.
2. Lower the oil pan enough to gain access to the pump.
2. Rotate the crankshaft so that the forward crankshaft throw and Nos. 1 and 2 connecting rod journals are up.
3. Remove the bolt retaining the pump to the main bearing cap. Let the pump and extension shaft fall into the pan.

To install:

4. Maneuver the pan, pump and extension shaft into position.
5. Position the pump on the bearing cap.
6. Align the extension shaft with the oil pump drive or vacuum pump. The pump should push easily into place. Install the pump and tighten the bolt to 65 ft. lbs.
7. Install the pan.

Rear Main Bearing oil Seal

REMOVAL & INSTALLATION

4.3L, 5.0L and 5.7L Engines

1. Raise and support the vehicle safely and remove the transmission from the vehicle.
2. Remove the oil pan bolts. Lower the oil pan.
3. Remove the screws and remove the seal retainer assembly.
4. Remove the gasket.
5. Insert a suitable tool into the notches provided in the seal retainer and pry the seal out.

NOTE: Whenever the retainer is removed a new retainer gasket and rear main seal must be installed.

1. Rear of block
2. Seal retainer
3. Crankshaft
4. Gasket
5. Screw

Rear main seal retainer installation—4.3L, 5.0L, 5.7L engines

Care should be taken when removing the seal so as not to nick the crankshaft sealing surface.

6. Before installation lubricate the new seal with clean engine oil.
7. Install the seal on tool J-35621 or equivalent. Thread the tool into the rear of the crankshaft. Tighten the screws snugly. This is to insure that the seal will be installed squarely over the crankshaft. Tighten the tool wing nut until it bottoms.
8. Remove the tool from the crankshaft.
9. Install the transmission.

Rear main seal removal notches—4.3L, 5.0L, 5.7L engines

4.8L ENGINE

The rear main bearing oil seal, both halves, can be removed without removal of the crankshaft. Always replace the upper and lower halves together.

1. Raise and support the vehicle safely, drain the oil and remove the oil pan.
2. Remove the rear main bearing cap.

3. Remove the old oil seal from its groove in the cap, prying from the bottom using a suitable tool.

4. Coat a new seal half completely with clean engine oil, and insert it into the bearing cap groove. Keep oil off of the parting line surface, as this surface is treated with glue. Gradually push the seal with a hammer handle until the seal is rolled into place.

Rear main seal installation—4.3L, 5.0L, 5.7L engines

1. Forward
2. Fabricated tool
3. Oil seal lip
4. Crankshaft
5. Upper seal half
6. Lower seal half
7. Main bearing cap

Installing rear crankshaft oil seal—4.8L, 7.4L engines

5. To remove the upper half of the old seal, use a small hammer and a soft, blunt punch to tap one end of the oil seal out until it protrudes far enough to be removed with needlenosed pliers. Push the new seal into place with the lip toward the front of the engine.

1. 4 mm ($1\frac{1}{64}$ inch)
2. 13 mm ($\frac{1}{2}$ inch)
3. 0.10 mm (0.004-inch) shim stock

Oil seal installation tool—4.8L, 7.4L engines

6. Install the bearing cap and torque the bolts to a loose fit—do not final torque. With the cap fitted loosely, move the crankshaft first to the rear and then to the front with a rubber mallet. This will properly position the thrust bearing. Torque the bearing cap to a final torque of 65 ft. lb. Install the oil pan.

6.2L Diesel Engine

The crankshaft need not be removed to replace the rear main bearing upper oil seal. The lower seal is installed in the bearing cap.

Removing the lower oil seal half—4.8L, 7.4L engines

NOTE: Engines are originally equipped with a rope-type seal. This should be replaced with the lip-type seal available as a service replacement.

1. Raise and support the vehicle safely. Drain the crankcase oil and remove the oil pan and rear main bearing cap.

2. Using a special main seal tool or a tool that can be made from a dowel, drive the upper seal into its groove on each side until it is tightly packed. This is usually $\frac{1}{4}$ – $\frac{3}{4}$ in. (6.35–19.05mm).

3. Measure the amount the seal was driven up on one side. Add $\frac{1}{16}$ in. (1.5875mm) and cut another length from the old seal. Use the main bearing cap as a holding fixture when cutting the seal as illustrated. Carefully trim protruding seal.

4. Work these two pieces of seal up into the cylinder block on each side with two nailsets or small screwdrivers. Using the packing tool again, pack these pieces into the block, then trim the flush with a razor blade or hobby knife as shown. Do not scratch the bearing surface with the razor.

Applying sealer to the block—4.8L, 7.4L engines

NOTE: It may help to use a bit of oil on the short pieces of the rope seal when packing it into the block.

5. Apply Loctite® No. 496 sealer or equivalent to the rear main bearing cap and install the rope seal. Cut the ends of the seal flush with the cap.

6. Check to see if the rear main cap with the new seal will seat properly on the block. Place a piece of Plastigage® on the rear main journal, install the cap and torque to 70 ft. lbs. Remove

Removing the upper oil seal half—4.8L, 7.4L engines

the cap and check the Plastigage® against specifications. If out of specs, recheck the end of the seal for fraying that may be preventing the cap from seating properly.

7. Make sure all traces of Plastigage® are removed from the crankshaft journal. Apply a thin film of sealer (GM part No. 1052357 or equivalent) to the bearing cap. Keep the sealant off of both the seal and the bearing.

8. Just before assembly, apply a light coat of clean engine oil on the crankshaft surface that will contact the seal.

9. Install the bearing cap and torque to specification.

10. Install the oil pump and oil pan.

7.4L Engine

The rear main bearing oil seal, both halves, can be removed without removal of the crankshaft. Always replace the upper and lower halves together.

1. Raise and support the vehicle safely, drain the oil and remove the oil pan.

2. Remove the oil pump and the rear main bearing cap.

3. Using a small pry bar, pry the oil seal from the rear main bearing cap.

4. Using a small hammer and a brass pin punch, drive the top half of the oil seal from the rear main bearing. Drive it out far enough, so it may be removed with a pair of pliers.

5. Using a non-abrasive cleaner, clean the rear main bearing cap and the crankshaft.

6. Fabricate an oil seal installation tool from 0.004" shim stock, shape the end to ½ in. long by 11/64 in. wide.

7. Coat the new oil seal with engine oil; do not coat the ends of the seal.

8. Position the fabricated tool between the crankshaft and the seal seat in the cylinder case.

9. Position the new half seal between the crankshaft and the top of the tool, so that the seal bead contacts the tip of the tool.

NOTE: Make sure that the seal lip is positioned toward the front of the engine.

10. Using the fabricated tool as a shoe horn, to protect the seal's bead from the sharp edge of the seal seat surface in the cylinder case, roll the seal around the crankshaft. When the seal's ends are flush with the engine block, remove the installation.

11. Using the same manner of installation, install the lower half onto the lower half of the rear main bearing cap.

12. Apply sealant to the cap-to-case mating surfaces and install the lower

rear main bearing half to the engine; keep the sealant off of the seal's mating line.

13. Install the rear main bearing cap bolts and torque to 10–12 ft.lb. Using a lead hammer, tap the crankshaft forward and rearward, to line up the thrust surfaces. Torque the main bearing bolts to 110 ft.lb. on 1986 C/K series and 1986–90 R/V series and 100 ft. lbs. on 1988–90 C/K series. Reverse the removal procedures. Refill the crankcase.

MANUAL TRANSMISSION

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

REMOVAL & INSTALLATION

1986 C Series and 1987-90 R Series

1. Raise and support the vehicle safely.

2. Drain the transmission.

3. Disconnect the speedometer cable, and back-up lamp wire at transmission.

4. Remove the gearshift lever by pressing down firmly on the slotted collar plate with a pair of channel lock pliers and rotating counterclockwise. Plug the opening to keep out dirt.

5. Remove driveshaft after marking the position of the shaft to the flange.

6. Position a transmission jack or its equivalent under the transmission to support it.

7. Remove the crossmember. Visually inspect to see if other equipment, brackets or lines, must be removed to permit removal of transmission.

NOTE: Mark position of crossmember when removing to prevent incorrect installation. The tapered surface should face the rear.

8. Remove the flywheel housing underpan.

9. Remove the top 2 transmission to housing bolts and insert 2 guide pins.

NOTE: The use of guide pins will not only support the transmission but will prevent damage to the clutch disc. Guide pins can be made by taking 2 bolts, the same as those just removed only longer, and cutting off the heads.

Make an adjustment slot. Be sure to support the clutch release bearing and support assembly during removal of the transmission. This will prevent the release from falling out of the flywheel housing.

10. Remove two remaining bolts and slide transmission straight back from engine. Use care to keep the transmission drive gear straight in line with clutch disc hub.

11. Remove the transmission from beneath your vehicle.

To install:

12. Place the transmission in 4th gear.

13. Coat the input shaft splines with high temperature grease.

14. Raise the transmission into position.

15. Install the guide pins in the top 2 bolt holes.

16. Roll the transmission forward and engage the clutch splines. Keep pushing the transmission forward until it mates with the engine.

17. Install the bolts, removing the guide pins. Torque the bolts to 75 ft. lbs.

18. Install the flywheel housing underpan.

19. Install the crossmember. Torque the crossmember-to-frame bolts to 55 ft. lbs.; the crossmember-to-transmission bolts to 40 ft. lbs.

20. Remove the transmission jack.

21. Install the driveshaft.

22. Install the gearshift lever.

23. Connect the speedometer cable, and back-up lamp wire at transmission.

24. Fill the transmission.

NOTE: Do not force the transmission into the clutch disc hub. Do not let the transmission hang unsupported in the splined portion of the clutch disc.

1986 K Series and 1987-90 V Series

1. Raise and support the vehicle safely.

2. Drain the transmission.

3. Disconnect the speedometer cable, and back-up lamp wire at transmission.

4. Remove the gearshift lever by pressing down firmly on the slotted collar plate with a pair of channel lock pliers and rotating counterclockwise. Plug the opening to keep out dirt.

5. Remove driveshaft after marking the position of the shaft to the flange.

6. Remove the transfer case.

7. Remove the exhaust pipes.

8. Position a transmission jack or its equivalent under the transmission to support it.

9. Remove the crossmember. Visually inspect to see if other equipment, brackets or lines, must be removed to permit removal of transmission.

NOTE: Mark position of crossmember when removing to prevent incorrect installation. The tapered surface should face the rear.

10. Remove the flywheel housing underpan.

11. Remove the top 2 transmission to housing bolts and insert 2 guide pins.

NOTE: The use of guide pins will not only support the transmission but will prevent damage to the clutch disc. Guide pins can be made by taking 2 bolts, the same as those just removed only longer, and cutting off the heads. Make an adjustment slot. Be sure to support the clutch release bearing and support assembly during removal of the transmission. This will prevent the release from falling out of the flywheel housing.

12. Remove two remaining bolts and slide transmission straight back from engine. Use care to keep the transmission drive gear straight in line with clutch disc hub.

13. Remove the transmission from beneath the vehicle.

To install:

14. Place the transmission in 4th gear.

15. Coat the input shaft splines with high temperature grease.

16. Raise the transmission into position.

17. Install the guide pins in the top 2 bolt holes.

18. Roll the transmission forward and engage the clutch splines. Keep pushing the transmission forward until it mates with the engine.

19. Install the bolts, removing the guide pins. Torque the bolts to 75 ft. lbs.

20. Install the flywheel housing underpan.

21. Install the crossmember. Torque the crossmember-to-frame bolts to 55 ft. lbs.; the crossmember-to-transmission bolts to 40 ft. lbs.

22. Install the transfer case.

23. Remove the transmission jack.

24. Install the exhaust system.

25. Install the driveshaft.

26. Install the gearshift lever.

27. Connect the speedometer cable, and back-up lamp wire at transmission.

28. Fill the transmission.

NOTE: Do not force the transmission into the clutch disc hub.

Do not let the transmission hang unsupported in the splined portion of the clutch disc.

1988-90 C Series

1. Raise and support the vehicle safely.

2. Drain the transmission.

3. Remove driveshaft after marking the position of the shaft to the flange.

4. Remove the exhaust pipes.

5. Disconnect the wiring harness at the transmission.

6. Remove the gearshift lever.

7. Remove the clutch slave cylinder and support it out of the way.

8. On the 85mm transmission, remove the flywheel housing inspection cover.

9. Position a transmission jack or its equivalent under the transmission to support it.

10. Remove the crossmember. Visually inspect to see if other equipment, brackets or lines, must be removed to permit removal of transmission.

NOTE: Mark position of crossmember when removing to prevent incorrect installation. The tapered surface should face the rear.

11. Remove the top 2 transmission to housing bolts and insert two guide pins.

NOTE: The use of guide pins will not only support the transmission but will prevent damage to the clutch disc. Guide pins can be made by taking two bolts, the same as those just removed only longer, and cutting off the heads. Make an adjustment slot. Be sure to support the clutch release bearing and support assembly during removal of the transmission. This will prevent the release from falling out of the flywheel housing.

11. Remove the remaining bolts and slide transmission straight back from engine. Use care to keep the transmission drive gear straight in line with clutch disc hub.

12. Remove the transmission from beneath the vehicle.

To install:

13. Place the transmission in 4th gear.

14. Coat the input shaft splines with high temperature grease.

15. Raise the transmission into position.

16. Install the guide pins in the top 2 bolt holes.

17. Roll the transmission forward and engage the clutch splines. Keep pushing the transmission forward until it mates with the engine.

18. Install the bolts, removing the guide pins. Torque the bolts to 75 ft. lbs. on the 117mm transmission and 37 ft. lbs. on the 85mm transmission.

19. Install the crossmember. Torque the crossmember-to-frame bolts to 55 ft. lbs.; the crossmember-to-transmission bolts to 40 ft. lbs.

20. Remove the transmission jack.

21. Install the slave cylinder.

22. Install the driveshaft.

23. Install the exhaust system.

24. Install the inspection cover on the 85mm transmission.

25. Install the gearshift lever.

26. Connect the wiring harness at the transmission.

27. Fill the transmission.

NOTE: Do not force the transmission into the clutch disc hub. Do not let the transmission hang unsupported in the splined portion of the clutch disc.

1988-90 K Series

1. Raise and support the vehicle safely.

2. Drain the transmission.

3. Remove driveshaft after making the position of the shaft to the flange.

4. Remove the transfer case.

5. Remove the exhaust pipes.

6. Disconnect the wiring harness at the transmission.

7. Remove the gearshift lever.

8. Remove the clutch slave cylinder and support it out of the way.

9. Remove the flywheel housing inspection cover.

10. Position a transmission jack or its equivalent under the transmission to support it.

11. Remove the crossmember. Visually inspect to see if other equipment, brackets or lines, must be removed to permit removal of transmission.

NOTE: Mark position of crossmember when removing to prevent incorrect installation. The tapered surface should face the rear.

12. Remove the top 2 transmission to housing bolts and insert two guide pins.

NOTE: The use of guide pins will not only support the transmission but will prevent damage to the clutch disc. Guide pins can be made by taking 2 bolts, the same as those just removed only longer, and cutting off the heads. Make an adjustment slot for a screwdriver. Be sure to support the clutch release bearing and support assembly during removal of the transmission. This will prevent the release from falling out of the flywheel housing.

13. Remove the remaining bolts and slide transmission straight back from engine. Use care to keep the transmission drive gear straight in line with clutch disc hub.

14. Remove the transmission from beneath the vehicle.

To install:

15. Place the transmission in 4th gear.

16. Coat the input shaft splines with high temperature grease.

17. Raise the transmission into position.

18. Install the guide pins in the top 2 bolt holes.

19. Roll the transmission forward and engage the clutch splines. Keep pushing the transmission forward until it mates with the engine.

20. Install the bolts, removing the guide pins. Torque the bolts to 37 ft. lbs.

21. Install the crossmember. Torque the crossmember-to-frame bolts to 55 ft. lbs.; the crossmember-to-transmission bolts to 40 ft. lbs.

22. Install the transfer case.

23. Remove the transmission jack.

24. Install the slave cylinder.

25. Install the driveshaft.

26. Install the exhaust system.

27. Install the gearshift lever.

28. Install the inspection cover.

29. Connect the wiring harness at the transmission.

30. Fill the transmission.

NOTE: Do not force the transmission into the clutch disc hub. Do not let the transmission hang unsupported in the splined portion of the clutch disc.

Van

1. Raise and support the vehicle safely.

2. Drain the transmission.

3. Disconnect the speedometer cable, back-up light and TCS switch.

4. Remove the shift controls from the transmission.

5. Disconnect the driveshaft and remove it from the vehicle.

6. Support the transmission using the proper equipment.

7. Inspect the transmission to be sure that all necessary components have been removed or disconnected.

8. Mark the front of the crossmember to be sure that it is installed correctly.

9. Support the clutch release bearing to prevent it from falling out of the flywheel housing when the transmission is removed.

10. Remove the flywheel housing under pan and transmission mounting bolts.

11. Move the transmission slowly

away from the engine, keeping the mainshaft in alignment with the clutch disc hub. Be sure that the transmission is supported.

12. Remove the transmission from under the vehicle.

To install:

13. Lightly coat the mainshaft with high temperature grease. Do not use much grease, since, under normal operation, the grease will be thrown onto the clutch, causing it to fail.

14. Raise the transmission into position under the vehicle.

15. Roll the unit forward, engaging the spline of the mainshaft with the splines in the clutch hub. Continue pushing forward until the transmission mates with the bellhousing.

16. Install and tighten the transmission-to-bellhousing bolts to 75 ft. lbs.

17. Install the flywheel housing under pan.

18. Install the crossmember. Torque the bolts to 50 ft. lbs.

19. Inspect the transmission to be sure that all necessary components have been installed or connected.

20. Connect the driveshaft.

21. Install the shift controls.

22. Connect the speedometer cable.

23. Connect the back-up light switch.

24. Connect the TCS switch.

25. Fill the transmission with lubricant.

26. Road test the vehicle.

LINKAGE ADJUSTMENT

3 Speed Column Shift

The gearshift linkage should be adjusted each time it is disturbed or removed.

The 1st/reverse rod must be adjusted before the 2nd/3rd rod.

1. Loosen the shift rod-to-transmission lever bolt.

2. Move the 1st/reverse transmission lever to the front detent, or, the 2nd/3rd transmission lever to the front detent, then back 1 detent.

3. Put the 1st/reverse column lever into reverse and lock the column, or, put the 2nd/3rd column lever into neutral.

4. Using a 1/4 in. drill bit as a gauge pin, place the bit through the holes in the column levers and the relay lever. All should align.

5. Hold the shift rod down tightly in the swivel and tighten the bolt. Remove the gauge pin.

CLUTCH

Mechanical Clutch Assembly

REMOVAL & INSTALLATION

Van

1. Raise and support the vehicle safely and remove the transmission.

2. Disconnect the clutch fork push-rod and spring. Remove the clutch housing.

3. Remove the clutch fork by pressing it away from the ball mounting with a suitable tool until the fork snaps loose from the ball or remove the ball stud from the clutch housing.

Exploded view of the clutch assembly—except 1988-90 C/K Series

Remove the throwout bearing from the clutch fork.

4. Install a pilot tool to hold the clutch while you are removing it.

NOTE: Before removing the clutch from the flywheel, mark the flywheel, clutch cover and pressure plate lug, so that these parts may be assembled in their same relative positions.

5. Loosen the clutch attaching bolts a turn at a time to prevent distortion of the clutch cover until the tension is released.

6. Remove the clutch pilot tool and the clutch from the vehicle.

7. Check the pressure plate and flywheel for signs of wear, scoring, overheating, etc. If the clutch plate, flywheel, or pressure plate is oil-soaked, inspect the engine rear main seal and the transmission input shaft seal, and correct leakage as required. Replace any damaged parts.

8. Install the pressure plate in the cover assembly, aligning the notch in the pressure plate with the notch in the cover flange. Install pressure plate retracting springs, lock washers and drive strap to pressure plate bolts. Tighten to 11 ft. lbs. The clutch is now ready to be installed.

9. Turn the flywheel until the X mark is at the bottom.

10. Install the clutch disc, pressure plate and cover, using an aligning tool.

11. Turn the clutch until the X mark or painted white letter on the clutch cover aligns with the X mark on the flywheel.

12. Install the attaching bolts and tighten them a little at a time in a crossing pattern until the spring pressure is taken up.

13. Remove the aligning tool.

14. Pack the clutch ball fork seat with a small amount of high temperature grease and install a new retainer in the groove of the clutch fork.

NOTE: Be careful not to use too much grease. Excessive amounts will get on the clutch fingers and cause clutch slippage.

15. Install the retainer with the high side up with the open end on the horizontal.

16. If the clutch fork ball was removed, reinstall it in the clutch housing and snap the clutch fork onto the ball.

17. Lubricate the inside of the throwout bearing collar and the throwout fork groove with a small amount of graphite grease.

18. Install the throwout bearing. Install the clutch housing.

19. Install the transmission.

20. Further installation is the reverse of removal. Adjust the clutch.

supported. This can be done by placing a hydraulic jack, with a board on top, under the oil pan.

1. Raise and support the vehicle safely and remove the transmission.

2. Remove the slave cylinder.

3. Remove the bellhousing cover.

4. Remove the bellhousing from the engine.

5. Remove the throwout spring and fork.

6. Remove the ballstud from the bellhousing.

7. Install a pilot tool to hold the clutch while you are removing it.

NOTE: Before removing the clutch from the flywheel, mark the flywheel, clutch cover and one pressure plate lug, so that these parts may be assembled in their same relative positions. They were balanced as an assembly.

8. Loosen the clutch attaching bolts one turn at a time to prevent distortion of the clutch cover until the tension is released.

9. Remove the clutch pilot tool and the clutch from the vehicle.

10. Check the pressure plate and flywheel for signs of wear, scoring, overheating, etc. If the clutch plate, flywheel, or pressure plate is oil-soaked, inspect the engine rear main seal and the transmission input shaft seal, and correct leakage as required. Replace any damaged parts.

To install:

11. Install the pressure plate in the cover assembly, aligning the notch in

Hydraulic Clutch Assembly

REMOVAL & INSTALLATION

Except Van

NOTE: Before removing the bellhousing, the engine must be

Exploded view of the clutch assembly — 1988-90 C/K Series

the pressure plate with the notch in the cover flange. Install pressure plate retracting springs, lockwashers and drive strap-to-pressure plate bolts. Tighten to 11 ft. lbs. The clutch is now ready to be installed.

NOTE: The manufacturer recommends that new pressure plate bolts and washers be used.

12. Turn the flywheel until the **X** mark is at the bottom.

13. Install the clutch disc, pressure plate and cover, using an old mainshaft as an aligning tool.

14. Turn the clutch until the **X** mark or painted white letter on the clutch cover aligns with the **X** mark on the flywheel.

15. Install the attaching bolts and tighten them a little at a time in a crossing pattern until the spring pressure is taken up.

16. Remove the aligning tool.

17. Coat the rounded end of the ballstud with high temperature wheel bearing grease.

18. Install the ballstud in the bellhousing. Pack the ballstud from the lubrication fitting.

19. Pack the inside recess and the outside groove of the release bearing with high temperature wheel bearing grease and install the release bearing and fork.

20. Install the release bearing seat and spring.

21. Install the clutch housing. Torque the bolts to 55 ft. lbs.

22. Install the cover.

23. Install the slave cylinder. Torque the bolt to 13 ft. lbs.

24. Install the transmission.

25. Bleed the hydraulic system.

FREE PEDAL TRAVEL ADJUSTMENT

Mechanical Clutch

This adjustment is for the amount of clutch pedal free travel before the throwout bearing contacts the clutch release fingers. It is required periodically to compensate for clutch lining wear. Incorrect adjustment will cause gear grinding and clutch slippage or wear.

1. Raise and support the vehicle safely. Disconnect the clutch fork return spring at the fork on the clutch housing.

2. Loosen the outer locknut on the adjusting rod.

3. Move the clutch fork back until clutch spring pressure is felt.

4. Hold the clutch pedal against its bumper and turn the inner adjusting nut until it is 0.28 in. (7.1mm) from the cross lever.

1. Retainer
2. Washer
3. Pushrod
4. Wave washer
5. Reservoir
6. Gasket

7. Hydraulic line, secondary cylinder
8. Nut
9. Master cylinder
10. Reservoir hose
11. Screw

Master cylinder and reservoir—except 1988-90 C/K Series

1. Retainer
2. Pushrod
3. Clutch pedal
4. Gasket
5. Hydraulic line
6. Nut
7. Master cylinder
8. Clamp

Master cylinder and reservoir—1988-90 C/K Series

Secondary (slave) cylinder and hydraulic line—except 1988–90 C/K Series

Secondary (slave) cylinder and hydraulic line—1988–90 C/K Series

5. Tighten the locknut against the cross lever.
6. Install the return spring.
7. Check the free travel at the pedal and readjust as necessary. It should be 1 $\frac{3}{8}$ in. (34mm).

Clutch Master Cylinder

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the lower steering column covers.
3. Remove the lower left side air conditioning duct, if so equipped.
4. Disconnect the pushrod from the clutch pedal.
5. Disconnect the reservoir hose.
6. Disconnect the secondary cylinder hydraulic line to the master cylinder.
7. Remove the master cylinder retaining nuts and remove the master cylinder.
8. To install, use a new gasket, reverse the removal procedure and bleed the clutch system.

Clutch Slave Cylinder

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Raise the vehicle and support it safely.
3. Disconnect the hydraulic line from the secondary cylinder.
4. Disconnect the hydraulic line from the master cylinder.
5. On all models except the 1988–90 C/K series, remove the nut retaining the hydraulic line and the speedometer cable to the cowl, then install the nut to hold the speedometer cable in place.
6. Cover all hydraulic lines to prevent dirt and moisture from entering the system.
7. Installation is the reverse of removal. Bleed the clutch hydraulic system.

BLEEDING THE HYDRAULIC CLUTCH SYSTEM

1. Fill the clutch master cylinder with the proper grade and type fluid. Raise and support the vehicle safely.
2. Remove the slave cylinder retaining bolts. Hold the cylinder about 45 degrees with the bleeder at the highest point.
3. Fully depress the clutch pedal and open the bleeder screw. Repeat until all air is expelled from the system.

4. Be sure that the fluid level remains full in the clutch master cylinder throughout the bleeding procedure.

AUTOMATIC TRANSMISSION

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

Transmission

REMOVAL & INSTALLATION

NOTE: It may be necessary to disconnect and remove the exhaust crossover pipe on V8s, and to disconnect the catalytic converter and remove its support bracket, on models so equipped.

2WD

1. Disconnect the battery ground cable. Disconnect the detent cable at the carburetor.

2. Raise and support the vehicle safely. Drain the transmission.

3. Remove the driveshaft, after matchmarking its flanges.

4. Disconnect the speedometer cable, downshift cable, vacuum modulator line, shift linkage, throttle linkage and fluid cooler lines at the transmission. Remove the filler tube.

5. Support the transmission and unbolt the rear mount from the crossmember. Remove the crossmember.

6. Remove the torque converter underpan, matchmark the flywheel and converter, and remove the converter bolts.

7. Support the engine and lower the transmission slightly for access to the upper transmission to engine bolts.

8. Remove the transmission to engine bolts and pull the transmission back and out of the vehicle. Rig up a strap or keep the front of the transmission up so the converter doesn't fall out.

9. Reverse the procedure for installation. Bolt the engine to the transmission first (34 ft. lbs.), then the converter to the flywheel (50 ft. lbs.). Make sure that the converter attaching lugs are flush and that the converter can turn freely before installing the bolts. Tighten the bolts fingertight, then torque to specification, to insure proper converter alignment.

NOTE: Lubricate the internal yoke splines at the transmission end of the driveshaft with lithium base grease. The grease should seep out through the vent hole.

4WD

1. Disconnect the battery ground cable and remove the transmission dipstick. Detach the downshift cable at the carburetor. Remove the transfer case shift lever knob and boot.

2. Raise and support the vehicle safely.

3. Remove the skid plate, if any. Remove the flywheel cover.

4. Matchmark the flywheel and torque converter, remove the bolts, and secure the converter so it doesn't fall out of the transmission.

5. Detach the shift linkage, speedometer cable, vacuum modulator line, downshift cable, throttle linkage and cooler lines at the transmission. Remove the filler tube.

6. Remove the exhaust crossover pipe to manifold bolts.

7. Unbolt the transfer case adapter from the crossmember. Support the transmission and transfer case. Remove the crossmember.

8. Move the exhaust system aside. Detach the driveshafts after matchmarking their flanges. Disconnect the parking brake cable.

9. Unbolt the transfer case from the frame bracket. Support the engine. Unbolt the transmission from the engine, pull the assembly back, and remove.

10. Reverse the procedure for installation. Bolt the transmission to the engine first (34 ft. lbs.), then the converter to the flywheel (50 ft. lbs.). Make sure that the converter attaching lugs are flush and that the converter can turn freely before installing the bolts.

SHIFT LINKAGE ADJUSTMENT

1. Raise and support the vehicle safely.

2. Loosen the shift lever bolt or nut at the transmission lever so that the lever is free to move on the rod.

3. Set the column shift lever to the neutral gate notch, by rotating it until the shift lever drops into the neutral gate. Do not use the indicator pointer as a reference to position the shift lever, as this will not be accurate.

4. Set the transmission lever in the neutral position by moving it clockwise to the park detent, then counterclockwise 2 detents to neutral.

5. Hold the rod tightly in the swivel and tighten the nut or bolt to 17 ft. lbs.

6. Move the column shifter to P and check that the engine starts. Check

the adjustment by moving the selector to each gear position.

DOWNSHIFT CONTROL RELAY

Turbo Hydra-Matic 400

All models use a downshift relay located on the firewall. By depressing the accelerator fully, the ECM will recognize the rapid increase in MAP sensor voltage, due to the drop in manifold vacuum, and turn on the downshift control relay. The relay will then send battery voltage to the detent solenoid, in the transmission, which opens an orifice and forces a transmission downshift. Replace the relay as necessary.

NEUTRAL START SWITCH ADJUSTMENT

This switch prevents the engine from being started unless the transmission is in Neutral or Park. It is located on the steering column. This switch also activates the back-up lights.

NOTE: The manual transmission back-up light switch is on the rear of the transmission.

1. Move the switch housing all the way toward the low gear position.

2. Move the gear selector to the PARK position. The main housing and housing back should ratchet, providing proper switch adjustment.

THROTTLE VALVE CABLE ADJUSTMENT

THM 700R4

The adjustment is made at the engine end of the cable with the engine off, by rotating the throttle lever by hand. Do not use the accelerator pedal to rotate the throttle lever.

1. Remove the air cleaner.

2. Depress and hold down the metal adjusting tab at the end of the cable.

3. Move the slider until it stops against the fitting.

4. Release the adjusting tab.

5. Rotate the throttle lever to the full extent of its travel.

6. The slider must move towards the lever when the lever is at full travel. Make sure that the cable moves freely.

NOTE: The cable may appear to function properly with the engine cold. Recheck it with the engine hot.

7. Road test the vehicle.

TRANSFER CASE

Transfer Case Assembly

REMOVAL & INSTALLATION

1986 K Series and 1987-90 V Series

MODEL 205

1. Disconnect the negative battery cable. Raise and support the vehicle safely.

2. Drain the fluid from the transfer case. Disconnect the speedometer cable. Remove the skid plate and the crossmember supports, as required.

3. Matchmark the transfer case front output shaft yoke and driveshaft for reassembly. Disconnect the driveshaft from the transfer case.

4. Matchmark the rear axle yoke and the driveshaft for reassembly. Remove the driveshaft. Disconnect the shift lever rod from the shift rail link.

5. Properly support the transfer case assembly. Remove the transfer case retaining bolts.

6. Remove the transfer case from the vehicle.

7. Installation is the reverse of the removal procedure.

MODEL 208

1. Disconnect the negative battery cable. Shift the transfer case into the 4HI position.

2. Raise and support the vehicle safely. Drain the fluid from the transfer case. Remove the cotter pin from the shift lever swivel.

3. Matchmark the transfer case front output shaft yoke and driveshaft for reassembly. Disconnect the driveshaft from the transfer case.

4. Matchmark the rear axle yoke and the driveshaft for reassembly. Remove the driveshaft.

5. Disconnect the speedometer cable. Disconnect the vacuum harness and all electrical connections at the transfer case.

6. Disconnect the parking brake cable guide from the pivot on the right frame rail, as required.

7. If the vehicle is equipped with automatic transmission, remove the right strut rod from the transfer case assembly.

8. Properly support the transfer case assembly. Remove the transfer case retaining bolts.

9. Remove the transfer case from the vehicle.

10. Installation is the reverse of the removal procedure.

1988-90 K Series

1. Disconnect the negative battery cable. Shift the transfer case into the 4HI position.

2. Raise and support the vehicle safely. Drain the fluid from the transfer case. Remove the the shift lever swivel. Disconnect the speed sensor electrical wire. Disconnect the indicator switch electrical wire.

3. Matchmark the transfer case front output shaft yoke and driveshaft for reassembly. Disconnect the driveshaft from the transfer case.

4. Matchmark the rear axle yoke and the driveshaft for reassembly. Remove the driveshaft.

5. Disconnect the parking brake cable guide from the pivot on the right frame rail, as required.

6. Properly support the transfer case assembly. Remove the transfer case retaining bolts.

7. Remove the skid shield and plate. Remove the transfer case from the vehicle.

8. Installation is the reverse of the removal procedure.

9. Bolt

Linkage

ADJUSTMENT

Model 208

1. Position the transfer case lever in the 4HI detent. Push the lower shift lever forward to the 4HI stop.

2. Install the swivel rod in the shift lever hole. Hang a 0.200 in. gauge rod behind the swivel.

3. Install the rear rod nut against the gauge with the shifter against the 4HI stop.

4. Remove the gauge tool. Push the rear of the swivel rearward against the nut.

5. Tighten the front rod nut against the swivel. Check for proper operation.

Model 205

1. Raise and support the vehicle safely. Remove the swivel from the transfer case shift lever.

2. Turn the swivel inward or outward to determine the correct shift detent.

3. Reinstall the swivel to the shift lever.

Model 1370

1. Position the transfer case lever in the 4HI position.
2. Raise and support the vehicle safely.
3. Disconnect the linkage rod from the console shift lever.
4. Shift the transfer case into the 4HI position (transfer shift lever in the forward detent).
5. Adjust the swivel to align with the hole in the console shift lever.
6. Lower the vehicle.

Model NP241

No adjustments are necessary on this model

FRONT DRIVE AXLE 1986 K SERIES AND 1987-90 V SERIES

Manual Locking Hubs

The engagement and disengagement of the hubs is a manual operation which must be performed at each hub assembly. The hubs should be placed fully in either Lock or Free position or damage will result.

NOTE: Do not use place the transfer case in either 4-wheel mode unless the hubs are in the Lock position!

Locking hubs should be run in the Lock position periodically for a few miles to assure proper differential lubrication.

Removal

NOTE: This procedure requires snapping pliers. It cannot be performed properly without them!

1. Raise and support the front end on jackstands.
2. Remove the wheels.
3. Lock the hubs. Remove the outer retaining plate Allen head bolts and take off the plate, O-ring, and knob assembly.

NOTE: These bolts may have washers.

Transfer case Installation—1988-90 C/K Series

4. Remove the external snapping from the axle shaft.
5. Remove the compression spring.
6. Remove the clutch cup.
7. Remove the O-ring and dial screw.
8. Remove the clutch nut and seal.
9. Remove the large internal snapping from the wheel hub.
10. Remove the inner drive gear.
11. Remove the clutch ring and spring.
12. Remove the smaller internal snapping from the clutch hub body and remove the hub body.

INSPECTION AND CLEANING

1. Clean all hub parts in a safe, non-flammable solvent and wipe them dry.
2. Inspect each component for wear or damage. Make sure that the springs are functional and stiff. Make sure that all gear teeth are intact, with no chips or burrs.
3. Make sure that the splines on the inside of the wheel hub are clean and free of dirt, chips and burrs.
4. Surface irregularities can be

cleaned up with light filing or emery paper.

5. Prior to assembly, coat all parts with the same wheel bearing grease you've used on the wheel bearings.

INSTALLATION

1. Install the hub body. Install the smaller internal snapping in the clutch hub body.

2. Install the clutch ring and spring.

3. Install the inner drive gear.

4. Install the large internal snapping in the wheel hub.

5. Install the external snapping on the axle shaft. If the snapping groove is not completely visible, reach around, inside the knuckle and push the axle shaft outwards.

6. Install the clutch nut and seal.

7. Install the O-ring and dial screw.

8. Install the clutch cup.

9. Install the compression spring.

10. Place the hub dial in the Lock position.

11. Coat the hub dial assembly O-ring with wheel bearing grease and position the hub dial and retainer on the hub.

12. Install the allen head bolts. Make sure that you used any washers that were there originally. Tighten these bolts to 45 inch lbs.

13. Rotate the hub dial to the Free position and turn the wheel hubs to make sure that the axle is free.

14. Install the wheels.

Automatic Locking Hubs

REMOVAL & INSTALLATION

The following procedure covers removal and installation only, for the hub assembly. The hub should be disassembled ONLY if overhaul is necessary. In that event, an overhaul kit will be required. Follow the instructions in the overhaul kit to rebuild the hub.

1. Remove the capscrews and washer from the hub cap.

2. Remove the hub cap and spring.

3. Remove the bearing race, bearing and retainer.

4. Remove the keeper from the outer clutch housing.

5. Remove the large snapping to release the locking unit. The snapping is removed by squeezing the ears of the snapping with needle-nose pliers.

6. Remove the locking unit from the hub. You can make this job easier by threading 2 hub cap screws into the outer clutch housing and hold these to pull out the unit.

To install:

7. Wipe clean all parts and check for wear or damage.

8. Coat all parts with the same wheel bearing grease you've used on the bearings.

9. Position the locking unit in the hub and install the large snapping. Pull outward on the unit to make sure the snapping is fully seated in its groove.

10. Install the keepers.

11. Install the bearing retainer, bearing and race. Make sure that the bearing is fully pack with grease.

12. Coat the hub cap O-ring with wheel bearing grease and install the hub cap.

13. Install the capscrews and washers. Torque the screws to 45 inch lbs.

Wheel Hub and Bearing

NOTE: Sodium-based grease is not compatible with lithium-based grease. Be careful not to mix the 2 types. If there is any doubt as to the type of grease used, completely clean the old grease from the bearing and hub before replacing.

REMOVAL

1. Raise and support the vehicle safely.

2. Remove the wheels.

3. Remove the hubs.

4. Wipe the inside of the hub to remove as much grease as possible.

5. Using your bearing nut socket, remove the locknut from the spindle.

6. With the locknut off you'll be able to see the locking ring on the adjusting nut. Remove the locking ring. A tool such as a dental pick will make this easier.

7. Using the special socket, remove the bearing adjusting nut.

NOTE: The adjusting nut and the locknut are almost identical. The difference is, the adjusting nut has a small pin on one side which indexes with a hole in the locking ring. Do not confuse the two nuts.

8. Dismount the brake caliper and suspend it out of the way, without disconnecting the brake line.

34. Ring

Automatic hub components — except 1988–90 C/K Series

9. Pull the hub off of the spindle. The outer bearing will tend to fall out as soon as it clears the spindle, so have a hand ready to catch it.

DISASSEMBLY

1. If you are going to reuse the outer bearing, place it on a clean surface.
2. Position the hub, face up, on 2 wood blocks placed under opposite sides of the rotor. Have a paper towel positioned under the hub.
3. Using a hardened wood dowel or a hammer handle, drive out the inner bearing and seal. If you are going to reuse the inner bearing, move it to a clean area. Discard the seal.
4. If the bearings are being replaced, you'll have to replace the races. The races are pressed into the hub, but you can drive them out.
5. With the hub in position on the blocks, use a long drift and hammer evenly around the outside diameter of the inner bearing race until it is free. Discard the race.
6. Turn the hub over and repeat

this procedure for the outer bearing race.

INSPECTION

1. If reusing the bearings, wash them in a non-flammable solvent and let them air-dry. Never use compressed air to spin-dry the bearings.
2. If either bearing shows any sign of damage, rust, heat blueing or excessive looseness, both bearings in that hub must be replaced as a set. If bearings are replaced, the races must be replaced also.

NOTE: If the bearings show signs of heat blueing, wipe the spindle clean and check for heat blueing on the spindle surface. If the spindle shows large areas of heat blueing, it should be replaced.

3. If reusing the bearings, wash out the hub with solvent and wipe it clean. Check the races. If they show signs of wear, pitting, cracking, rusting or heat

blueing, they, along with the bearings, must be replaced.

INSTALLATION

1. If new races are being installed, coat the race and its bore in the hub with high temperature wheel bearing grease.
2. Position the race in the bore and start gently tapping it into place. There are drivers made for this purpose. Just tap evenly around the race as it is driven into place so that it doesn't cock in the bore. Drive the race in until it is fully seated against the shoulder in the bore. It's fully seated in 2 ways:
 - a. The hammer blows will sound differently when the race seats against the shoulder.
 - b. The grease applied to the bore will be squeezed out below the race as the race seats against the shoulder.
- Either race can be installed first.
3. Pack the bearings thoroughly

with high temperature wheel bearing grease.

4. Place the inner bearing in its race and position a new seal in the hub bore. Gently tap around the outer diameter of the seal with a plastic mallet until the seal is flush with the end of the bore.

5. Carefully place the hub assembly on the spindle. Take care to avoid damaging the seal on the spindle threads. Make sure the hub is all the way on the spindle.

6. Place the outer bearing on the spindle and slide it into place in its race.

7. Thread the adjusting nut on the spindle until it contacts the outer bearing.

NOTE: Make sure the adjusting nut is used. Remember, it has a small pin on one side. That pin must face outwards.

8. Using the special socket and the torque wrench:

a. Tighten the adjusting nut to 50 ft. lbs. while rotating the hub.

b. Back off the adjusting nut until it is loose.

c. While rotating the hub, tighten the adjusting nut to 35 ft. lbs. for automatic locking hubs or 50 ft. lbs. for manual locking hubs.

d. Back off the adjusting nut $\frac{1}{4}$ to $\frac{3}{8}$ of a turn for automatic hubs or $\frac{1}{6}$ to $\frac{1}{4}$ turn for manual hubs.

9. Coat the locking ring with wheel bearing grease. Place the locking ring on the spindle. There is a tab on the inner diameter of the ring which must fit in the slot on the top of the spindle. Slide the locking ring in until it contacts the adjusting nut. The pin on the adjusting nut must enter one of the holes in the locking ring. If the locking ring is seated properly the grease on the ring will be pushed out of one of the holes by the pin, and the ring will not rock from side-to-side when pressed on either side. If the locking ring and pin don't index, take note of how far off they are, pull the ring off the spindle and turn the nut, either by hand or with the socket, just enough for a good fit. Try the locking ring again.

10. When the locking ring engages the adjusting nut pin properly, your bearing adjustment is set. Thread the locknut onto the spindle until it contacts the locking ring.

11. Tighten the locknut to *at least* 160 ft. lbs. This locknut ensures that the locking ring and adjusting nut don't move. Over-tightening the locknut has no effect on the bearing adjustment.

12. Install the locking hub.

13. Install the caliper.

15. Install the wheel.

Axle Shaft

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely.

2. Remove the wheel.

3. Remove the locking hub.

4. Remove the hub and bearing assembly.

5. Remove the nuts and remove the caliper mounting bracket and splash shield.

6. Tap the end of the spindle with a plastic mallet to break it loose from the knuckle. If tapping won't break it loose, proceed as follows:

a. Thread the bearing locknut part way onto the spindle.

b. Position a 2- or 3-jawed pull with the jaws grabbing the locknut and the screw bearing in the end of the axle shaft.

c. Tighten the puller until the spindle breaks free. It will be very helpful to spray Liquid Wrench®, WD-40® or similar solvent around the spindle mating area and around the bolt holes. As the puller is tightened, tap the spindle with the plastic mallet. This often helps break the spindle loose.

7. Pull out the axle shaft assembly.

To install:

8. Place the spacer and a new seal on the axle shaft.

NOTE: The spacer's chamfer points towards the oil deflector.

9. Pack the spindle bearing with wheel bearing grease.

10. Slide the axle shaft into the housing. When installing the axle shaft, turn the shaft slowly to align the splines with the differential.

11. Place the spindle on the knuckle. Be sure the seal and oil deflector are in place.

12. Install the caliper bracket and splash shield.

13. Using new washers, install the nuts and torque them to 65 ft. lbs.

14. Install the hub and rotor assembly. Adjust the wheel bearings.

15. Install the locking hubs.

16. Install the caliper.

17. Install the wheel.

Axle Shaft U-Joint

OVERHAUL

1. Raise and support the vehicle safely and remove the axle shaft.

2. Squeeze the ends of the trunnion bearings in a vise to relieve the load on the snaprings. Remove the snaprings.

3. Support the yoke in a vise and drive on one end of the trunnion bear-

ing with a brass drift enough to drive the opposite bearing from the yoke.

4. Support the other side of the yoke and drive the other bearing out.

5. Remove the trunnion.

6. Clean and check all parts. You can buy U-joint repair kits to replace all the worn parts.

7. Lubricate the bearings with wheel bearing grease.

8. Replace the trunnion and press the bearings into the yoke and over the trunnion hubs far enough to install the lock rings.

9. Hold the trunnion in one hand and tap the yoke lightly to seat the bearings against the lock rings.

10. The axle slingers can be pressed off the shaft.

NOTE: Always replace the slingers if the spindle seals are replaced.

11. Replace the shaft.

Pinion Seal

REMOVAL & INSTALLATION

1. Using a holding bar tool J-8614-1, attached to the pinion shaft flange, remove the self locking nut and washer from the pinion shaft.

2. Install tool J-8614-2, and 3 into the holding bar and remove the flange from the drive pinion. Remove the drive pinion from the carrier.

3. With a long drift, tap on the inner race of the outer pinion bearing to remove the seal.

4. Install the oil seal, gasket and using Tool J-22804 install the oil seal.

5. Install the flange, washer and nut and torque the nut to 270 ft. lbs.

Axle Housing

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely.

2. Matchmark and remove the driveshaft.

3. Disconnect the connecting rod from the steering arm.

4. Disconnect the brake caliper and position it out of the way, without disconnecting the brake line.

5. Disconnect the shock absorbers from the axle brackets.

6. Remove the front stabilizer bar.

7. Disconnect the axle vent tube clip at the differential housing.

8. Take up the weight of the axle assembly using a suitable jack.

9. Remove the nuts, washers, U-bolts and plates from the axle and separate the axle from the springs. Re-

move the axle assembly from the vehicle.

To install:

10. Position the axle under the vehicle.

11. Install the plates, U-bolts, washers, and nuts. Tighten the nuts to 150 ft. lbs.

12. Remove the jack.

13. Connect the axle vent tube clip at the differential housing.

14. Install the front stabilizer bar.

15. Connect the shock absorbers at the axle brackets. Torque the bolts to 65 ft. lbs.; 88 ft. lbs. with quad shocks.

16. Install the brake caliper

17. Connect the connecting rod at the steering arm.

18. Install the driveshaft.

FRONT DRIVE AXLE 1988-90 K SERIES

Constant Velocity (CV) Joint

OVERHAUL

1. Using a punch, mark the link yoke and the adjoining yokes before disassembly to ensure proper reassembly and driveshaft balance.

NOTE: It is easier to remove the universal joint bearings from the flange yoke first. The first pair of flange yoke universal joint bearings to be removed is the pair in the link yoke.

2. With the driveshaft in a horizontal position, solidly support the link yoke (a 1 $\frac{1}{8}$ in. pipe will do).

3. Apply force to the bearing cup on the opposite side with a 1 $\frac{1}{8}$ in. pipe or a socket the size of the bearing cup. Use a vise or press to apply force. Force the cup inward as far as possible.

NOTE: In the absence of a press, a heavy vise may be used, but make sure that the universal to be removed is at a right angle to the jaws of the vise. Do not cock the bearing cups in their bores.

4. Remove the pieces of pipe and complete the removal of the protruding bearing cup by tapping around the circumference of the exposed portion of the bearing with a small hammer.

5. Reverse the position of the pieces of pipe and apply force to the exposed journal end. This will force the other bearing cup out of its bore and allow removal of the flange.

NOTE: There is a ball joint located between the two universals. The ball portion of this joint is on the inner end of the flange yoke. The ball, as well as the ball seat parts, is replaceable. Care must be taken not to damage the ball. The ball portion of this joint is on the driveshaft. To remove the seat, pry the seal out with a screwdriver.

6. To remove the journal from the flange, use steps two through five.

7. Remove the universal joint bearings from the driveshaft using the steps from two through five. The first pair of bearing caps that should be removed is the pair in the link yoke.

8. Examine the ball stud seat and ball stud for scores or wear. Worn seats can be replaced with a kit. A worn ball, however, requires the replacement of the entire shaft yoke and flange assembly. Clean the ball seat cavity and fill it with grease. Install the spring, washer, ball seats, and spacer, if removed.

9. Install the universal joints opposite the order in which they were disassembled.

10. Install a bearing $\frac{1}{4}$ of the way into one side of the yoke.

11. Insert the journal into the yoke so that an arm of the journal seats into the bearing.

12. Press the bearing in the remaining distance and install its snapping.

13. Install the opposite bearing. Do not allow the bearing rollers to jam. Continually check for free movement of the journal in the bearings as they are pressed into the yoke.

14. Install the rest of the bearings in the same manner.

NOTE: The flange yoke should snap over center to the right or left and up or down by the pressure of the ball seat spring.

Indicator Switch

REPLACEMENT

1. Remove the skid plate.

2. Unplug the electrical connector.

3. Unscrew the switch.

4. Installation is the reverse of removal. Coat the threads of the switch with sealer. Torque the switch to 15 ft. lbs. and the skid plate bolts to 25 ft. lbs.

Thermal Actuator

REPLACEMENT

1. Remove the skid plate.

2. Unplug the electrical connector.

3. Unscrew the actuator.

4. Installation is the reverse of removal. Coat the threads of the actuator with sealer. Torque the actuator to 16 ft. lbs.

Left Side Axle Shaft, Hub and Bearing

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely.

2. Remove the wheel.

3. Remove the skid plate.

4. Remove the left stabilizer bar clamp.

5. Remove the left stabilizer bar bolt, spacer and bushings at the lower control arm.

6. Disconnect the left inner tie rod end from the steering relay rod.

7. Remove the hub nut and washer. Insert a long drift or dowel through the vanes in the brake rotor to hold the rotor in place.

8. Remove the axle shaft inner flange bolts.

9. Using a puller, force the outer end of the axle shaft out of the hub. Remove the shaft.

NOTE: Never allow the vehicle to rest on the wheels with the axle shaft removed.

To install:

10. Position the shaft in the hub and install the washer and hub nut. Leave the drift in the rotor vanes and tighten the hub nut to 175 ft. lbs.

11. Install the flange bolts. Tighten them to 59 ft. lbs. Remove the drift.

12. Connect the left inner tie rod end at the steering relay rod. Torque the nut to 35 ft. lbs.

13. Install the left stabilizer bar bolt, spacer and bushings at the lower control arm. Torque the bolt to 24 ft. lbs.

14. Install the left stabilizer bar clamp. Torque the bolts to 12 ft. lbs.

15. Install the skid plate.

Right Side Axle Shaft, Hub and Bearing

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely.

Front axle components — 1988-90 C/K Series

2. Remove the wheel.
3. Remove the skid plate.
4. Remove the right stabilizer bar clamp.
5. Remove the right stabilizer bar bolt, spacer and bushings at the lower control arm.
6. Disconnect the right inner tie rod end from the steering relay rod.
7. Remove the hub nut and washer. Insert a long drift or dowel through the vanes in the brake rotor to hold the rotor in place.
8. Remove the axle shaft inner flange bolts.
9. Using a puller, force the outer end of the axle shaft out of the hub. Remove the shaft.

NOTE: Never allow the vehicle to rest on the wheels with the axle shaft removed!

To install:

10. Position the shaft in the hub and install the washer and hub nut. Leave the drift in the rotor vanes and tighten the hub nut to 175 ft. lbs.
11. Install the flange bolts. Tighten them to 59 ft. lbs. Remove the drift.
12. Connect the right inner tie rod end at the steering relay rod. Torque the nut to 35 ft. lbs.
13. Install the right stabilizer bar bolt, spacer and bushings at the lower control arm. Torque the bolt to 12 ft. lbs.
14. Install the right stabilizer bar clamp. Torque the bolts to 24 ft. lbs.
15. Install the skid plate.

Axle Tube Assembly

REMOVAL

1. Raise and support the vehicle safely.
2. Remove the right wheel.
3. Position a drain pan under the axle.
4. Remove the stabilizer bar.
5. Remove the skid plate.
6. Disconnect the right inner tie rod end at the relay rod.
7. Remove the axle shaft flange bolts, turn the wheel to loosen the axle from the axle tube, push the axle towards the front of the truck and tie it out of the way.
8. Unplug the indicator switch and actuator electrical connectors.
9. Remove the drain plug and drain the fluid from the case.
10. Remove the axle tube-to-frame mounting bolts.
11. Remove the axle tube-to-carrier bolts.
12. Remove the axle tube/shaft assembly. Keep the open end up.

DISASSEMBLY

1. Position the axle tube, open end up, in a vise by clamping on the mounting flange.
2. Remove the snapping, sleeve, connector and thrust washer from the shaft end.
3. Tap out the axle shaft with a plastic mallet.
4. Turn the tube, outer end up, and pry out the deflector and seal.
5. Using a slide hammer and bearing remover adapter, remove the bearing.
6. Clean all parts in a non-flammable solvent and inspect them for wear or damage. Clean off all old gasket material.

ASSEMBLY

1. Using a bearing driver, install the new bearing in the tube.
2. Coat the lips of a new seal with wheel bearing grease and tap it into place in the tube.
3. Install the deflector.
4. Insert the axle shaft into the tube.
5. Coat the thrust washer with grease to hold it in place and position it on the tube end. Make sure the tabs index the slots.
6. Install the sleeve, connector and snapping.

INSTALLATION

1. Position a new gasket, coated with sealer, on the carrier. Raise the tube assembly into position and install the tube-to-carrier bolts. Torque the bolts to 30 ft. lbs.
2. Install the axle shaft flange bolts and torque them to 59 ft. lbs.
3. Install the axle tube-to-frame bolts.
4. Connect the tie rod end to the relay rod. Torque the nut to 35 ft. lbs.
5. Install the stabilizer bar. Torque the brackets to 24 ft. lbs.; the links to 12 ft. lbs.
6. Connect the actuator and switch.
7. Install the drain plug. Tighten it to 24 ft. lbs.
8. Fill the axle and tighten the filler plug to 24 ft. lbs.
9. Install the skid plate. Tighten the bolts to 25 ft. lbs.

Output Shaft

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely.
2. Drain the axle.
3. Remove the left side axle shaft.

4. Remove the lower carrier mounting bolt.

5. Carefully pry against the lower part of the carrier to provide clearance for the output shaft removal. While prying, insert a prybar between the output shaft flange and the carrier case. Pry the output shaft free. Be careful, as possible damage to the carrier may result.

6. Remove the deflector and seal from the carrier.

To install:

1. Lubricate the lips of a new seal with wheel bearing grease and drive it into place.
2. Install the deflector.
3. Pry against the case and position the output shaft in the carrier. Tap it into place with a plastic mallet.
4. Install the lower carrier mounting bolt, washer and nut. Torque the bolt to 80 ft. lbs.
5. Install the left axle shaft.
6. Fill the axle.

Pinion Seal

REPLACEMENT

1. Raise and support the vehicle safely.
2. Matchmark and disconnect the front driveshaft at the carrier.
3. Remove the wheels.
4. Dismount the calipers and wire them up, out of the way.
5. Position an inch pound torque wrench on the pinion nut. Measure the torque needed to rotate the pinion one full revolution. Record the figure.
6. Matchmark the pinion flange, shaft and nut. Count and record the number of exposed threads on the pinion shaft.
7. Hold the flange and remove the nut and washer.
8. Using a puller, remove the flange.
9. Carefully pry the seal from its bore. Be careful to avoid scratching the seal bore.
10. Remove the deflector from the flange.

To install:

11. Clean the seal bore thoroughly.
12. Remove any burrs from the deflector staking on the flange.
13. Tap the deflector onto the flange and stake it in three places.
14. Position the new seal in the carrier bore and drive it into place until flush. Coat the seal lips with wheel bearing grease.
15. Coat the outer edge of the flange neck with wheel bearing grease and slide it onto the pinion shaft.
16. Place a new nut and washer onto the pinion shaft and tighten it to the position originally recorded. That is,

the alignment marks are aligned, and the recorded number of threads are exposed on the pinion shaft.

NOTE: Never hammer the flange onto the pinion.

17. Measure the rotating torque of the pinion. Compare this to the original torque. Tighten the pinion nut, in small increments, until the rotating torque is 3 inch lbs. greater than the original torque.

18. Install the driveshaft.

19. Install the calipers.

20. Install the wheels.

Differential Carrier

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely.
2. Remove the wheels.
3. Remove the skid plate.
4. Drain the carrier.
5. Matchmark and remove the front driveshaft.
6. Disconnect the right axle shaft at the tube flange.
7. Disconnect the left axle shaft at the carrier flange.
8. Wire both axle shafts out of the way.
9. Unplug the connectors at the indicator switch and actuator.
10. Disconnect the carrier vent hose.
11. Remove the axle tube-to-frame bolts, washers and nuts.
12. Remove the lower carrier mounting bolt.
13. Disconnect the right side inner tie rod end at the relay rod.
14. Depending on model, it may be necessary to remove the engine oil filter.
15. Support the carrier on a floor jack.
16. Remove the upper carrier mounting bolt.
17. Lower the carrier assembly from the truck.

To install:

18. Raise the carrier into position.
19. Install the upper carrier mounting bolt, washers and nut. Then, install the lower carrier mounting bolt, washers and nut. Torque the bolts to 80 ft. lbs.
20. Remove the jack.
21. Install the oil filter.
22. Connect the tie rod end. Torque the nut to 35 ft. lbs.
23. Install the axle tube-to-frame bolts, washers and nuts. Torque the nuts to 75 ft. lbs. for 15 and 25 series; 107 ft. lbs. for 35 series.
24. Connect the vent hose.
25. Connect the wiring.
26. Connect the axle shafts at the flanges. Torque the bolts to 59 ft. lbs.

27. Connect the driveshaft. Torque the bolts to 15 ft. lbs.
28. Fill the carrier with SAE 85W-90 gear oil.
29. Install the wheels.
30. Add any engine oil lost when the filter was removed.

REAR WHEEL DRIVE AXLE

Driveshaft and U-Joints

Tubular driveshafts are used on all models, incorporating needle bearing U-joints. An internally splined sleeve at the forward end compensates for variation in distance between the rear axle and the transmission.

The number of driveshafts used is determined by the length of the wheelbase. On vehicles that use 2 driveshafts there is a center support incorporating a rubber cushioned ball bearing mounted in a bracket attached to the frame crossmember. The ball bearing is permanently sealed and lubricated.

Extended lift U-joints have been incorporated on most models and can be identified by the absence of a lubrication fitting.

Rear Driveshaft

REMOVAL & INSTALLATION

All Models

1. Raise and support the vehicle safely.
2. Scribe alignment marks on the driveshaft and flange of the rear axle, and transfer case or transmission. If the vehicle is equipped with a two piece driveshaft, be certain to also scribe marks at the center joint near the splined connection. When reinstalling driveshafts, it is necessary to place the shafts in the same position from which they were removed. Failure to reinstall the driveshaft properly will cause driveline vibrations and reduced component life.
3. Disconnect the rear universal joint by removing U-bolts or straps. Tape the bearings into place to avoid losing them.
4. If there are U-bolts or straps at the front end of the shaft, remove them. Tape the bearings into place. For vehicles with 2 piece shafts, re-

move the bolts retaining the bearing support to the frame crossmember. Compress the shaft slightly and remove it.

5. If there are no fasteners at the front end of the transmission, there will only be a splined fitting. Slide the shaft forward slightly to disengage the axle flange, lower the rear end of the shaft, then pull it back out of the transmission. Most 2WD vehicles are of this type. For vehicles with 2 piece driveshafts, remove the bolts retaining the bearing support to the frame crossmember.

6. Reverse the procedure for installation. It may be tricky to get the scribed alignment marks to match up on vehicles with two piece driveshafts. For those models only, the following instructions may be of some help. First, slide the grease cap and gasket onto the rear splines.

7. Models with 32 splines have an alignment key. The driveshaft cannot be replaced incorrectly. Simply match up the key with the keyway.

8. On 2WD automatic transmission models, lubricate the internal yoke splines at the transmission end of the shaft with lithium base grease. The grease should seep out through the vent hole.

NOTE: A thump in the rear driveshaft sometimes occurs when releasing the brakes after braking to a stop, especially on a downgrade. This is most common with automatic transmission. It is often caused by the driveshaft splines binding and can be cured by removing the driveshaft, inspecting the splines for rough edges, and carefully lubricating. A similar thump may be caused by the clutch plates in Positraction limited slip rear axles binding. If this isn't caused by wear, it can be cured by draining and refilling the rear axle with the special lubricant and adding Positraction additive, both of which are available from dealers and aftermarket suppliers.

U-Joints

OVERHAUL

There are 2 types of U-joints used in these vehicles. The first is held together by wire snaprings in the yokes. The second type is held together with injection molded plastic retainer rings. This type cannot be reassembled with the same parts, once disassembled. However, repair kits are available. end of the front driveshaft.

Snap-Ring Type

1. Remove the driveshaft(s) from the vehicle.
2. Remove the lockrings from the yoke and remove the lubrication fitting.
3. Support the yoke in a bench vise. Never clamp the driveshaft tube.
4. Use a soft drift pin and hammer to drive against one trunnion bearing to drive the opposite bearing from the yoke.

NOTE: The bearing cap cannot be driven completely out.

5. Grasp the cap and work it out.
6. Support the other side of the yoke and drive the other bearing cap from the yoke and remove as in Steps 4 and 5.
7. Remove the trunnion from the driveshaft yoke.
8. If equipped with a sliding sleeve, remove the trunnions bearings from the sleeve yoke in the same manner as above. Remove the seal retainer from the end of the sleeve and pull the seal and washer from the retainer.

To remove the bearing support:

9. Remove the dust shield, or, if equipped with a flange, remove the cotter pin and nut and pull the flange and deflector assembly from the shaft.
10. Remove the support bracket from the rubber cushion and pull the cushion away from the bearing.
11. Pull the bearing assembly from the shaft. If equipped, remove the grease retainers and slingers from the bearing.

Assemble the bearing support as follows:

12. Install the inner deflector on the driveshaft and punch the deflector on 2 opposite sides to be sure that it is tight.
13. Pack the retainers with special high melting grease. Insert a slinger (if used) inside one retainer and press this retainer over the bearing outer race.
14. Start the bearing and slinger on the shaft journal. Support the driveshaft and press the bearing and inner slinger against the shoulder of the shaft with a suitable pipe.
15. Install the second slinger on the shaft and press the second retainer on the shaft.
16. Install the dust shield over the shaft (small diameter first) and depress it into position against the outer slinger or, if equipped with a flange, install the flange and deflector. Align the centerline of the flange yoke with the centerline of the driveshaft yoke and start the flange straight on the splines of the shaft with the end of the flange against the slinger.

17. Force the rubber cushion onto the bearing and coat the outside diameter of the cushion with clean brake fluid.

18. Force the bracket onto the cushion.

Assemble the trunnion bearings:

19. Repack the bearings with grease and replace the trunnion dust seals after any operation that requires disassembly of the U-joint. But be sure that the lubricant reservoir at the end of the trunnion is full of lubricant. Fill the reservoirs with lubricant from the bottom.

20. Install the trunnion into the driveshaft yoke and press the bearings into the yoke over the trunnion hubs as far as it will go.

21. Install the lockrings.

22. Hold the trunnion in one hand and tap the yoke slightly to seat the bearings against the lockrings.

23. On the rear driveshafts, install the sleeve yoke over the trunnion hubs and install the bearings in the same manner as above.

Molded Retainer Type

1. Remove the driveshaft.

2. Support the driveshaft in a horizontal position. Place the U-joint so that the lower ear of the shaft yoke is supported by a 1½ in. socket. Press the lower bearing cup out of the yoke ear. This will shear the plastic retaining the lower bearing cup.

NOTE: Never clamp the driveshaft tubing in a vise.

3. If the bearing cup is not completely removed, lift the cross, insert a spacer and press the cup completely out.

4. Rotate the driveshaft, shear the opposite plastic retainer, and press the other bearing cup out in the same manner.

5. Remove the cross from the yoke. Production U-joints cannot be reassembled. There are no bearing retainer grooves in the cups. Discard all parts that we removed and substitute those in the overhaul kit.

6. Remove the sheared plastic bearing retainer. Drive a small pin or punch through the injection holes to aid in removal.

7. If the front U-joint is serviced, remove the bearing cups from the slip yoke in the manner previously described.

8. Be sure that the seals are installed on the service bearing cups to hold the needle bearings in place for handling. Grease the bearings if they aren't pregreased.

9. Install one bearing cup partway into one side of the yoke and turn this ear to the bottom.

Center bearing and driveshaft—except 1988–90 C/K Series

10. Insert the opposite bearing cup partway. Be sure that both trunnions are started straight into the bearing cups.

11. Press against opposite bearing cups, working the cross constantly to be sure that it is free in the cups. If binding occurs, check the needle rollers to be sure that one needle has not

become lodged under an end of the trunnion.

12. As soon as one bearing retainer groove is exposed, stop pressing and install the bearing retainer snapping.

13. Continue to press until the opposite bearing retainer can be installed. If difficulty installing the snaprings is encountered, rap the yoke with a ham-

mer to spring the yoke ears slightly.

14. Assemble the other half of the U-joint in the same manner.

Axle Shaft

REMOVAL & INSTALLATION

Chevrolet 8½ and 9½ Inch Without Eaton Locking Differential

1. Raise and support the vehicle safely. Remove the tire and wheel assembly. Remove the brake drums.

2. Remove the carrier cover retaining bolts. Remove the carrier cover.

3. Remove the rear axle pinion shaft lock screw and the rear axle pinion shaft. Discard the lock screw.

4. Push the flanged end of the axle shaft toward the center of the vehicle. Remove the C lock clip from the button end of the shaft.

5. Remove the axle shaft from the housing. Be careful not to damage the oil seal.

6. When removing the axle shaft on vehicles equipped with the 9½ inch ring gear, be sure that the thrust washer in the differential case does not slide out.

7. Installation is the reverse of the removal procedure. Be sure to use a new carrier gasket or RTV, as required. Fill the axle housing to within ⅜ in. of the filler hole.

Chevrolet 8½ AND 9½ Inch With Eaton Locking Differential

1. Raise and support the vehicle safely. Remove the tire and wheel assembly. Remove the brake drums.

2. Remove the carrier cover retaining bolts. Remove the carrier cover.

3. Rotate the case so that the thrust block and the pinion shaft are upward. Support the pinion shaft so that it cannot fall into the case. Remove the lock screw.

4. Carefully withdraw the pinion shaft part way out of its mounting. Rotate the case until the case just touches the housing.

5. Using a suitable tool, reach into the case and rotate the C lock until its open points directly inward. The axle shaft cannot be pushed inward until the C lock is properly positioned.

6. When the C lock is positioned to pass through the end of the thrust block, push the axle shaft inward. Remove the C lock.

7. Remove the axle shaft from the vehicle.

8. Installation is the reverse of the removal procedure. Be sure to use a new carrier gasket or RTV, as required. Fill the axle housing to within ⅜ in. of the filler hole.

Chevrolet 10½ and Dana 9¾ and 10½ Inch

1. Raise and support the vehicle safely. Remove the tire and wheel assembly.

2. Remove the bolts that retain the axle shaft flange to the wheel hub.

3. Tap the flange with a suitable hammer and loosen the axle shaft.

4. Twist the shaft assembly and remove it from the axle tube.

5. Installation is the reverse of the removal procedure.

6. Place a new gasket or apply RTV sealant over the axle shaft. Position the shaft in the housing so that the shaft splines enter the differential side gear.

Axle Shaft Seal

REMOVAL & INSTALLATION

Chevrolet 8½ and 9½ Inch

1. Raise and support the vehicle

1. Rear driveshaft
2. Slip yoke
3. Support bearing
4. Transmission yoke

5. Front driveshaft
6. Crossmember
7. Vertical
8. Horizontal

Two piece driveshaft alignment—1988-90 C/K Series

safely. Remove the tire and wheel assembly. Remove the brake drum.

2. Remove the carrier cover retaining bolts. Remove the carrier cover.

3. Remove the rear axle pinion shaft lock screw and the rear axle pinion shaft. Discard the lock screw.

4. Push the flanged end of the axle shaft toward the center of the vehicle. Remove the C lock clip from the button end of the shaft.

5. Remove the axle shaft from the housing.

6. When removing the axle shaft on vehicles equipped with the 9½ inch ring gear, be sure that the thrust washer in the differential case does not slide out.

7. Using the proper removal tool, remove the seal from its mounting.

8. Installation is the reverse of the removal procedure. Be sure to use a new carrier gasket or RTV, as required. Fill the axle housing to within ⅜ in. of the filler hole.

Chevrolet 10½ and Dana 9¾ and 10½ Inch

1. Raise and support the vehicle safely. Remove the tire and wheel assembly.

2. Remove the bolts that retain the axle shaft flange to the wheel hub.

3. Tap the flange with a suitable hammer and loosen the axle shaft.

4. Twist the shaft assembly and remove it from the axle tube. Remove the oil seal from its mounting.

5. Installation is the reverse of the removal procedure.

6. Place a new gasket or apply RTV sealant over the axle shaft. Position the shaft in the housing so that the shaft splines enter the differential side gear.

Axle Shaft Bearings

REMOVAL & INSTALLATION

Chevrolet 8½ and 9½ Inch

1. Raise and support the vehicle safely. Remove the tire and wheel assembly. Remove the brake drum.

2. Remove the carrier cover retaining bolts. Remove the carrier cover.

3. Remove the rear axle pinion shaft lock screw and the rear axle pinion shaft. Discard the lock screw.

4. Push the flanged end of the axle shaft toward the center of the vehicle. Remove the C-lock clip from the button end of the shaft.

5. Remove the axle shaft from the housing.

6. When removing the axle shaft on vehicles equipped with the 9½ inch ring gear, be sure that the thrust washer in the differential case does not slide out.

Axle shaft and housing components

7. Using the proper removal tool, remove the seal from its mounting.

8. Insert tool J-23689 into the bore so that the tool grasps behind the bearing. Slide the washer against the outside of the seal. Turn the nut finger tight. Using a slide hammer remove the bearing and seal.

9. On vehicles equipped with the 9½ inch ring gear, use tool J-29712. Insert the tool into the axle tube so that it grasps behind the bearing. Center the receiver on the axle tube and tighten the nut. Back off the nut and remove the bearing and seal from the tool.

Full floating axle and components

Rockwell 12 inch ring gear axle and hub components

10. Installation is the reverse of the removal procedure. Be sure to use a new carrier gasket or RTV, as required. Fill the axle housing to within $\frac{3}{8}$ in. of the filler hole.

Chevrolet 10 $\frac{1}{2}$ and Dana 9 $\frac{3}{4}$ and 10 $\frac{1}{2}$ Inch

1. Raise and support the vehicle safely. Remove the tire and wheel assembly.

2. Remove the bolts that retain the axle shaft flange to the wheel hub.

3. Tap the flange with a suitable hammer and loosen the axle shaft.

4. Twist the shaft assembly and remove it from the axle tube. Remove the oil seal from its mounting.

5. Using a hammer and a long drift pin, knock the inner bearing, cup and oil seal from the hub assembly.

6. Using a snapping pliers, remove the outer bearing. Using tool J-24426 and J-8092, drive the outer bearing and cup from the hub assembly.

7. Installation is the reverse of the removal procedure.

8. Place a new gasket or apply RTV sealant over the axle shaft. Position the shaft in the housing so that the shaft splines enter the differential side gear.

Pinion Seal

REMOVAL & INSTALLATION

Semi-Floating Axles

1. Raise and support the vehicle safely. It would help to have the front

end slightly higher than the rear to avoid fluid loss.

2. Matchmark and remove the driveshaft.

3. Release the parking brake.

4. Remove the rear wheels. Rotate the rear wheels by hand to make sure that there is absolutely no brake drag. If there is brake drag, remove the drums.

5. Using a torque wrench on the pinion nut, record the force needed to rotate the pinion.

6. Matchmark the pinion shaft, nut and flange. Count the number of exposed threads on the pinion shaft.

7. Install a holding tool on the pinion. A very large adjustable wrench will do, or, if one is not available, put the drums back on and set the parking brake as tightly as possible.

8. Remove the pinion nut.

9. Slide the flange off of the pinion. A puller may be necessary.

10. Centerpunch the oil seal to distort it and pry it out of the bore. Be careful to avoid scratching the bore.

To install:

11. Pack the cavity between the lips of the seal with lithium-based chassis lube.

12. Position the seal in the bore and carefully drive it into place.

13. Pack the cavity between the end of the pinion splines and the pinion flange with Permatex No.2® sealer, or equivalent non-hardening sealer.

14. Place the flange on the pinion and push it on as far as it will go.

15. Install the pinion washer and nut

on the shaft and force the pinion into place by turning the nut.

NOTE: Never hammer the flange into place.

16. Tighten the nut until the exact number of threads previously noted appear and the matchmarks align.

17. Measure the rotating torque of the pinion under the same circumstances as before. Compare the two readings. As necessary, tighten the pinion nut in very small increments until the torque necessary to rotate the pinion is 3 inch lbs. higher than the originally recorded torque.

18. Install the driveshaft.

Full Floating Axle

WITH 9 $\frac{3}{4}$ AND 10 $\frac{1}{2}$ INCH RING GEAR

1. Raise and support the vehicle safely. It would help to have the front end slightly higher than the rear to avoid fluid loss.

2. Matchmark and remove the driveshaft.

3. Matchmark the pinion shaft, nut and flange. Count the number of exposed threads on the pinion shaft.

4. Install a holding tool on the pinion. A very large adjustable wrench will do, or, if one is not available, set the parking brake as tightly as possible.

5. Remove the pinion nut.

6. Slide the flange off of the pinion. A puller may be necessary.

7. Centerpunch the oil seal to distort it and pry it out of the bore. Be careful to avoid scratching the bore.

To install:

8. Pack the cavity between the lips of the seal with lithium-based chassis lube.

9. Position the seal in the bore and carefully drive it into place. A seal installer is helpful in doing this.

10. Place the flange on the pinion and push it on as far as it will go.

11. Install the pinion washer and nut on the shaft and force the pinion into place by turning the nut.

WARNING: Never hammer the flange into place!

12. Tighten the nut until the exact number of threads previously noted appear and the matchmarks align.

13. Install the driveshaft.

Differential Carrier

REMOVAL & INSTALLATION

Dana 9 $\frac{3}{4}$ and 10 $\frac{1}{2}$ Inch

1. Raise and support the vehicle safely. Allow the rear axle assembly to

hang freely. Remove the tire and wheel assemblies. Drain the lubricant.

2. Remove the axle shaft to hub retaining nuts. Rap the axle shaft to loosen it from the hub. Remove the shafts.

3. Remove the cap screws and lock washers retaining the cover to the carrier. Remove the carrier cover and gasket.

4. Mark one side of the carrier and matching cap for reassembly in the same position. Remove the bearing caps.

5. Using a spreader tool and a dial indicator gauge, spread the carrier assembly to a maximum of .015 in.

6. Remove the dial indicator tool. Use a prybar and remove the differential case from the carrier.

7. Record the dimension and location of the side bearing shims. Remove the spreader tool.

8. Installation is the reverse of the removal procedure.

Axle Housing Assembly

REMOVAL & INSTALLATION

All Series

1. Raise and support the vehicle safely.

2. For the 9¾ in. ring gear and the 10½ in. ring gear axles, place jackstands under the frame side rails for support.

3. Drain the lubricant from the axle housing and remove the driveshaft.

4. Remove the wheel, the brake drum or hub and the drum assembly.

5. Disconnect the parking brake cable from the lever and at the brake flange plate.

6. Disconnect the hydraulic brake lines from the connectors.

7. Disconnect the shock absorbers from the axle brackets.

8. Remove the vent hose from the axle vent fitting (if used).

9. Disconnect the height sensing and brake proportional valve linkage (if used).

10. Support the stabilizer shaft assembly with a hydraulic jack and remove (if used).

11. Remove the nuts and washers from the U-bolts.

12. Remove the U-bolts, spring plates and spacers from the axle assembly.

13. Lower the jack and remove the axle assembly.

To install:

14. Raise the axle assembly into position.

15. Install the U-bolts, spring plates and spacers.

16. Install the nuts and washers on the U-bolts. Torque the nuts to 130 ft. lbs. for 30/3500 series; 120 series for all other models.

17. Install the stabilizer shaft.

18. Connect the height sensing and brake proportional valve linkage.

19. Install the vent hose at the axle vent fitting.

20. Connect the shock absorbers at the axle brackets. Torque the nuts to 80 ft. lbs.

21. Connect the hydraulic brake lines.

22. Connect the parking brake cable.

23. Install the wheels.

24. Install the driveshaft.

25. Fill the axle housing.

STEERING

Steering Wheel

REMOVAL & INSTALLATION

1. Disconnect the battery ground cable.

2. Remove the horn button cap. On some models, it may be necessary to disconnect the horn wire.

3. Mark the steering wheel-to-steering shaft relationship.

4. Remove the snapping from the steering shaft.

5. Remove the nut and washer from the steering shaft.

6. Remove the steering wheel with a puller.

7. Installation is the reverse of removal. The turn signal control assembly must be in the Neutral position to prevent damaging the canceling cam and control assembly. Torque the nut to 30 ft. lbs.

Manual Steering Gear

REMOVAL & INSTALLATION

1986 C/K Series, 1987-90 R/V Series and Van

1. Set the front wheels in straight ahead position by driving vehicle a short distance on a flat surface.

2. Raise and support the vehicle safely, as required.

4. Matchmark the relationship of the universal yoke to the wormshaft.

5. Remove the universal yoke pinch bolt.

6. Mark the relationship of the pitman arm to the pitman shaft.

7. Remove the pitman shaft nut and then remove the pitman arm from the pitman shaft, using puller J-6632.

8. Remove the steering gear to frame bolts and remove the gear assembly.

To install:

7. Place the steering gear in position, guiding the steering gear shaft into the universal yoke.

8. Install the steering gear to frame bolts and torque to 75 ft. lbs.

9. Install the yoke pinch bolt. Torque the pinch bolt to 45 ft. lbs.

10. Install the pitman arm onto the pitman shaft, lining up the marks made at removal. Install the pitman shaft nut torque to 185 ft. lbs.

1988-90 C/K Series

1. Set the front wheels in straight ahead position by driving vehicle a short distance on a flat surface. Raise and support the vehicle safely.

2. Remove the shield.

3. Remove the adapter nut and washer and remove the adapter.

4. Mark the relationship of the pitman arm to the pitman shaft.

5. Remove the pitman shaft nut and washer then remove the pitman arm from the pitman shaft, using a puller.

6. Remove the steering gear to frame bolts.

7. Disconnect the the flexible coupling from the steering shaft and remove the gear assembly.

To install:

8. Align the flat of the flexible coupling with the flat on the shaft. Push the coupling onto the shaft until the wormshaft bottoms on the coupling reinforcement.

9. Install the steering gear to the frame and tighten the bolts to 100 ft. lbs.

10. Install the pinch bolt. Make sure the bolt passes through the shaft undercut. Tighten the pinch bolt to 22 ft. lbs.

11. Install the adapter to the steering box, install the washer and nut and tighten to 5.3 inch lbs.

12. Install the shield to the adapter.

13. Install the pitman arm onto the pitman shaft, lining up the marks made at removal. Install the pitman shaft nut and torque to 185 ft. lbs.

ADJUSTMENT

Before any steering gear adjustments are made, it is recommended that the front end of the vehicle be raised and supported safely and a thorough inspection be made for stiffness or lost motion in the steering gear, steering linkage and front suspension. Worn or damaged parts should be replaced, since a satisfactory adjustment of the steering gear cannot be obtained if bent or badly worn parts exist.

It is also very important that the steering gear be properly aligned in the vehicle. Misalignment of the gear places a stress on the steering worm shaft, therefore a proper adjustment is impossible. To align the steering gear, loosen the steering gear-to-frame mounting bolts to permit the gear to align itself. Check the steering gear to frame mounting seat. If there is a gap at any of the mounting bolts, proper alignment may be obtained by placing shims where excessive gap appears. Tighten the steering gear-to-frame bolts. Alignment of the gear in the van is very important and should be done carefully so that a satisfactory, trouble-free gear adjustment may be obtained.

The steering gear is of the recirculating ball nut type. The ball nut, mounted on the worm gear, is driven by means of steel balls which circulate in helical grooves in both the worm and nut. Ball return guides attached to the nut serve to recirculate the two sets of balls in the grooves. As the steering wheel is turned to the right, the ball nut moves upward. When the wheel is turned to the left, the ball nut moves downward.

Before doing the adjustment procedures given below, ensure that the steering problem is not caused by faulty suspension components, bad front end alignment, etc. Then, proceed with the following adjustments.

Bearing Drag

1. Disconnect the pitman arm from the gear.
2. Disconnect the battery ground cable.
3. Remove the horn cap.
4. Turn the steering wheel gently to the left stop, then back ½ turn.
5. Position an inch-pound torque wrench on the steering wheel nut and rotate it through a 90 degree arc. Note the torque. Proper torque is 5-8 inch lbs.
6. If the torque is incorrect, loosen the adjuster plug locknut and back off the plug ¼ turn, then tighten the plug to give the proper torque.
7. Hold the plug and tighten the adjuster plug locknut to 85 ft. lbs.

Overcenter Preload

1. Turn the steering wheel lock-to-lock counting the total number of turns. Turn the wheel back ½ the total number of turns to center it.
2. Turn the lash (sector shaft) adjuster screw clockwise to remove all lash between the ball nut and sector teeth. Tighten the locknut to 22 ft. lbs.
3. Using a torque wrench on the steering wheel nut, observe the highest reading while the gear is turned

- | | |

Power steering gear installation—1986 C Series and 1987-90 R Series

through the center position. It should be 16 inch lbs. or less.

4. If necessary repeat adjust the preload with the adjuster screw. Tighten the locknut to 22 ft. lbs.

Power Steering Gear REMOVAL & INSTALLATION

1986 C/K Series and 1987-90 R/V Series

1. Set the front wheels in straight ahead position by driving vehicle a short distance on a flat surface. Raise and support the vehicle safely as required.
2. Place a drain pan below the steering gear.

3. Disconnect the negative battery cable.

4. Disconnect the fluid lines. Cap the openings.

5. Remove the flexible coupling to the steering shaft flange bolts.

6. Mark the relationship of the pitman arm to the pitman shaft.

7. Remove the pitman shaft nut and then remove the pitman arm from the pitman shaft, using puller J-6632.

8. Remove the steering gear to frame bolts and remove the gear assembly.

9. Align the flat of the flexible coupling with the flat on the shaft. Push the coupling onto the shaft until the wormshaft bottoms against the end of the shaft.

10. Install the pinch bolt. Make sure

- | | |
|--------------------|-----------------------------|
| 1. Mounting bolt | 7. Coupling |
| 2. Pinch bolt | 8. Spacer |

Power steering gear installation—1986 K Series and 1987-90 V Series

the bolt passes through the shaft undercut. Tighten the pinch bolt to 31 ft. lbs.

11. Place the steering gear into position, guiding the coupling bolts into the proper holes in the shaft flange.

12. Install the steering gear to frame bolts and torque to 75 ft. lbs.

13. Install the coupling flange nuts and washers. Make sure the coupling alignment pins are centered in the flange slots. Tighten the nuts to 20 ft. lbs. Maintain a coupling to flange dimension of 0.250–0.375 inches.

14. Install the pitman arm.

15. Install the hoses.

1988-90 C/K Series

1. Set the front wheels in straight ahead position by driving vehicle a short distance on a flat surface. Raise and support the vehicle safely, as required.

2. Place a drain pan below the steering gear.

3. Disconnect the negative battery cable.

4. Disconnect the fluid lines. Cap the openings.

5. Remove the shield draw alignment marks on the clamp and the steering shaft and remove the lower clamp bolt. Remove the clamp from the shaft.

6. Remove the pitman shaft nut and then remove the pitman arm from the pitman shaft, using puller J-6632.

7. Remove the steering gear to frame bolts and remove the gear assembly.

To install:

8. Install the steering gear to the frame using the bolts and washers and tighten to 69 ft. lbs.

9. Install the pitman arm.

10. Make sure the alignment marks line up and install the clamp and tighten the bolt to 30 ft. lbs.

11. Install the hoses and tighten the hose coupling to 45 ft. lbs. Bleed the system.

Van

1. Set the front wheels in straight ahead position by driving vehicle a short distance on a flat surface. Raise and support the vehicle safely, as required.

2. Place a drain pan below the steering gear.

3. Disconnect the negative battery cable.

4. Disconnect the fluid lines. Cap the openings.

5. Matchmark the relationship of the universal yoke to the stub shaft.

6. Remove the universal yoke pinch bolt.

- | | |

Power steering gear installation—1988–90 C/K Series

5. Mark the relationship of the pitman arm to the pitman shaft.

6. Remove the pitman shaft nut and then remove the pitman arm from the pitman shaft, using puller J-6632.

7. Remove the steering gear to frame bolts and remove the gear assembly.

To install:

8. Place the steering gear in position, guiding the steering gear shaft into the universal yoke.

9. Install the steering gear to frame bolts and torque to 75 ft. lbs.

10. Install the yoke pinch bolt. Torque the pinch bolt to 45 ft. lbs.

11. Install the pitman arm onto the pitman shaft, lining up the marks made at removal. Install the pitman shaft nut torque to 185 ft. lbs.

12. Connect the fluid lines and refill the reservoir. Bleed the system.

Adjustments

For proper adjustment, remove the gear from the vehicle and drain all the fluid from the gear and place the gear in a vise.

It is important that the adjustments be made in the order given.

Worm Bearing Preload

1. Remove the adjuster plug locknut.

2. Turn the adjuster plug in clockwise until firmly bottomed. Then, tighten it to 20 ft. lbs.

3. Place an index mark on the gear housing in line with one of the holes in the adjuster plug.

4. Measure counterclockwise from the mark about 1/4 inch and make another mark on the housing.

5. Rotate the adjuster plug counterclockwise until the hole is aligned with the second mark.

6. Install the locknut. Hold the plug and tighten the locknut to 81 ft. lbs.

7. Place an inch pound torque wrench and 12-point deep socket on the stub shaft and measure the stub shaft rotating torque, starting with the torque wrench handle in a vertical position to a point 1/4 turn to either side. Note your reading. The proper torque should be 4-10 inch lbs. If the reading is incorrect, either your adjustment was done incorrectly or there is gear damage.

Overcenter Preload

1. Loosen the locknut and turn the pitman shaft adjuster screw counterclockwise until it is all the way out. Then, turn it in 1/2 turn.

2. Rotate the stub shaft from stop to stop, counting the total number of turns, then turn it back 1/2 that number to center the gear.

3. Place the torque wrench in a vertical position on the stub shaft and measure the torque necessary to rotate the shaft to a point 45 degrees to either side of center. Record the highest reading.

On gears with less than 400 miles, the reading should be 6-10 inch lbs. higher than the worm bearing preload torque previously recorded, but not to exceed 18 inch lbs..

On gears with more than 400 miles, the reading should be 4-5 inch lbs. higher, but not to exceed 14 inch lbs.

4. If necessary, adjust the reading by turning the adjuster screw.

5. When the adjustment is made, hold the screw and tighten the locknut to 32 ft. lbs.

6. Install the gear.

Power Steering Pump

REMOVAL & INSTALLATION

1. Place a drain pan under the pump.

2. Disconnect the negative battery cable.

3. Disconnect and cap the hoses at the pump.

NOTE: On models with a remote reservoir disconnect and cap the reservoir hose at the pump.

4. Loosen the pump adjusting bolts and nuts and remove the pump belt.

5. Remove the adjusting bolts, nuts and brackets and remove the pump assembly.

6. To remove the pulley from the pump install tool J-29785-A or equivalent. Make sure the pilot bolt bottoms in the pump shaft by turning the nut to the top of the pilot bolt. Hold the pilot bolt and turn the nut counterclockwise.

To install:

7. Connect the brackets to the pump.

8. Place the pulley on the end of the pump shaft and install tool J-25033-B or equivalent. Make sure the pilot bolt bottoms in the pump shaft by turning the nut to the top of the pilot bolt. Hold the pilot bolt and turn the nut clockwise.

NOTE: On models with a remote reservoir fill the pump housing with as much fluid as possible before mounting.

9. Install the pump assembly and attaching parts loosely to the engine.

10. Install the hoses to the pump and fill the reservoir. Bleed the pump by turning the pulley backwards

(counterclockwise as viewed from the front) until the air bubbles cease to appear.

11. Tighten all retaining bolts and nuts.

12. Install the pump belt over the pulley and adjust.

13. Fill and bleed the system.

SYSTEM BLEEDING

1. Fill the reservoir to the proper level and let the fluid remain undisturbed for at least 2 minutes.

2. Start the engine and run it for only about 2 seconds.

3. Add fluid as necessary.

4. Repeat Steps 1-3 until the level remains constant.

5. Raise the front of the vehicle so that the front wheels are off the ground. Set the parking brake and block both rear wheels front and rear. Manual transmissions should be in neutral; automatic transmissions should be in **PARK**.

6. Start the engine and run it at approximately 1500 rpm.

7. Turn the wheels (off the ground) to the right and left, lightly contacting the stops.

8. Add fluid as necessary.

9. Lower the vehicle and turn the wheels right and left on the ground.

10. Check the level and refill as necessary.

11. If the fluid is extremely foamy, let the vehicle stand for a few minutes with the engine off and repeat the procedure. Check the belt tension and check for a bent or loose pulley. The pulley should not wobble with the engine running.

12. Check that no hoses are contacting any parts of the vehicle, particularly sheet metal.

13. Check the oil level and refill as necessary. This step and the next are very important. When willing, follow Steps 1-10 above.

14. Check for air in the fluid. Aerated fluid appears milky. If air is present, repeat the above operation. If it is obvious that the pump will not respond to bleeding after several attempts, a pressure test may be required.

Tie Rod Ends

REMOVAL & INSTALLATION

1986 C Series, 1987-90 R Series and Van

1. Raise and support the vehicle safely. As required, remove the tire and wheel assembly.

2. Remove the cotter pins and nuts.

Using the proper removal tool, J-6627A, separate the outer tie rod from the steering knuckle.

NOTE: Do not attempt to disengage the ball joint from the steering knuckle using a wedge type tool, because seal damage could result.

3. Disconnect the inner tie rod from the relay rod using tool J-6627A. Remove the tie rod ends from the adjuster tubes.

4. To install, grease the threads and turn the new tie rod end in as many turns as were needed to remove it. This will give approximately correct toe-in. Tighten the clamp bolts to 14 ft. lbs.

5. Tighten the stud nuts to 45 ft. lbs. and install new cotter pins. You may tighten the nut to align the cotter pin, but don't loosen it.

6. Adjust the toe-in.

1986 K Series and 1987-90 V Series

1. Raise and support the vehicle safely. As required, remove the tire and wheel assembly.

2. Remove the cotter pins and nuts from the rod assembly. Disconnect the shock absorber from the tie rod assembly.

3. Using the proper removal tool, J-6627A, separate the outer tie rod from the steering knuckle.

NOTE: Do not attempt to disengage the ball joint from the steering knuckle using a wedge type tool, because seal damage could result.

4. Disconnect the tie rod end bodies. Count the number of turns needed to remove the end bodies. Remove the tie rod ends from the adjuster tube.

5. For reinstallation note the position of the adjuster tube and the direction from which the bolts are installed.

6. Installation is the reverse of removal. When installing the tie rod ends, turn them in until the same number of threads previously visible are achieved. Tighten the locknuts.

7. Install the tie rod assembly in the knuckles and tighten the castellated nuts to 40 ft. lbs. Always advance the nut to align the cotter pin hole. Never back it off.

8. Tighten the tie rod end locknuts to 175 ft. lbs.

9. Adjust the front alignment, as required.

1988-90 C/K Series

1. Raise and support the vehicle safely.

Steering linkage—1986-90 Van

2. Remove the nut from the knuckle end ball stud. Discard the nut.

3. Using a screw-type ball joint tool, separate the tie rod ball stud from the knuckle.

4. Remove the nut from the relay rod end ball stud.

5. Using a screw-type ball joint tool, separate the tie rod ball stud from the relay rod.

6. Clean the threaded parts of the

tie rod ends thoroughly and count the exact number of threads exposed on each tie rod end. Measure the overall length of the tie rod assembly.

7. Loosen the clamp nuts, spread the clamps and unscrew each tie rod end.

To install:

8. Coat the threaded parts of the new tie rod ends with chassis grease. Screw the tie rod ends into the sleeve until the exact number of threads is exposed on each tie rod end. Check the overall length of the new assembly. Adjust as necessary. Don't tighten the clamp nuts yet.

9. Position the tie rod assembly in the relay rod and install a new nut on the ball stud. Torque the nut to 40 ft. lbs.

10. Position the other tie rod end in the knuckle. Install the new nut and torque it to 40 ft. lbs.

11. Before tightening the clamp nuts:

a. Each clamp must be positioned between the locating dimples at each end of the adjuster.

b. The clamps must be positioned with the nut facing forward and within 45° of horizontal.

c. The split in the sleeve must be position at a point just above the clamp nut.

12. Tighten the clamp nuts to 14 ft. lbs. When the clamp nuts are tightened, the clamp ends may touch, but the split in the clamp, at the adjuster sleeve, must never be less than 0.127mm (0.005 in.).

BRAKE SYSTEM

For all brake system repair and service procedures not detailed below, please refer to "Brakes" in the Unit Repair section.

Master Cylinder

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Disconnect any electrical connections from the master cylinder, as required. Disconnect and plug the fluid lines.

2. If equipped with power brakes, remove the master cylinder to power booster retaining bolts. Remove the RAWL control module assembly, 1988-90 C/K Series, if equipped.

3. If equipped with manual brakes, remove the master cylinder pushrod from the brake pedal. Remove the RAWL control module assembly, on 1988-90 C/K Series.

4. Remove the master cylinder from the vehicle. If equipped with power brakes remove the vacuum booster pushrod.

5. Installation is the reverse of the removal procedure. Bench bleed the master cylinder prior to installation. If equipped with power brakes be sure to install the vacuum booster pushrod. Bleed the system, as required.

Proportioning Valve REMOVAL & INSTALLATION

1986 C/K Series, 1987-90 R/V Series and Van

1. Disconnect the negative battery cable. Disconnect the hydraulic lines and plug to prevent dirt from entering the system.

2. Disconnect the warning switch harness.

3. Remove the retaining bolts and remove the valve.

4. Install in reverse of removal and bleed the brake system.

1988-90 C/K Series

WITH MANUAL BRAKES

1. Disconnect the negative battery cable. Disconnect the hydraulic lines and plug to prevent dirt from entering the system.

2. Disconnect the warning switch harness.

3. Remove the retaining bolts and remove the valve.

4. Install in reverse of removal and bleed the brake system.

WITH POWER BRAKES

1. Disconnect the negative battery cable. Disconnect the hydraulic lines and plug to prevent dirt from entering the system.

2. Disconnect the warning switch harness.

3. Remove the RAWL control module assembly from the bracket.

4. Remove the bolts holding the Isolation/Dump Valve to the bracket.

5. Remove the nuts that hold the master cylinder and bracket to the brake booster.

6. Remove the bracket and combination valve assembly.

7. Installation is the reverse of removal. Tighten the nuts that hold the master cylinder and bracket to the brake booster to 20 ft. lbs. and the bolts holding the Isolation/Dump Valve to the bracket to 21 ft. lbs.

Power Brake Boosters

REMOVAL & INSTALLATION

Vacuum Booster

1. Disconnect the negative battery cable. Apply the parking brakes.

2. Support the master cylinder and remove the master cylinder mounting nuts.

3. Disconnect the vacuum hose from the check valve.

4. Disconnect the booster pushrod.

5. Remove the booster mounting nuts from inside the vehicle and remove the booster.

6. Installation is the reverse of removal.

Hydraulic Booster (Hydra-Boost)

1. Disconnect the negative battery cable. Apply the parking brakes.

2. Disconnect the hydraulic lines from the booster.

3. Support the master cylinder and remove the master cylinder mounting nuts.

4. Disconnect the booster pushrod.

5. Remove the booster mounting nuts from inside the vehicle and remove the booster.

6. Installation is the reverse of removal. Bleed the brake system, as required.

7. To bleed the hydro boost system, fill the power steering pump to the proper level. Allow the fluid to remain undisturbed for a few minutes.

8. Start the engine and add fluid until the level is constant with the engine running.

9. Raise and support the vehicle safely. Start the engine and turn the wheels from stop to stop, add fluid as required. Turn the engine off and lower the vehicle.

10. Start the engine and depress the brake pedal several times while rotating the steering wheel from stop to stop. Turn the engine off and pump the brake pedal 4 or 5 times.

11. If the power steering fluid is extremely foamy, allow the vehicle to sit for a short time and then perform step nine again.

Brake Caliper

REMOVAL & INSTALLATION

1986 C/K Series, 1987-90 R/V Series and Van

DELCO TYPE

1. Remove the cover on the master cylinder and siphon enough fluid out of the reservoirs to bring the level to $\frac{1}{2}$ full. This step prevents spilling fluid when the piston is pushed back.

2. Raise and support the vehicle safely. Remove the front wheels and tires.

3. Push the brake piston back into its bore using a C-clamp to pull the caliper outward.

4. Remove the 2 bolts which hold the caliper and then lift the caliper off the disc.

NOTE: Do not let the caliper assembly hang by the brake hose.

5. Remove the inboard and outboard shoe.

NOTE: If the pads are to be re-installed, mark them inside and outside.

6. Remove the pad support spring from the piston.

7. Remove the 2 sleeves from the inside ears of the caliper and the 4 rub-

ber bushings from the grooves in the caliper ears.

8. Remove the hose from the steel brake line and tape the fittings to prevent foreign material from entering the line or the hoses.

9. Remove the retainer from the hose fitting.

10. Remove the hose from the frame bracket and pull off the caliper with the hose attached.

11. Check the inside of the caliper for fluid leakage; if so, the caliper should be overhauled.

NOTE: Do not use compressed air to clean the inside of the caliper as this may unseat the dust boot.

12. Connect the brake line to start re-installation. Lubricate the sleeves, rubber bushings, bushing grooves, and the end of the mounting bolts using silicone lubricant.

13. Install new bushing in the caliper ears along with new sleeves. The sleeve should be replaced so that the end toward the shoe is flush with the machined surface of the ear.

14. Position the support spring and the inner pad into the center cavity of the piston. The outboard pad has ears which are bent over to keep the pad in position while the inboard pad has ears on the top end which fit over the caliper retaining bolts. A spring which is inside the brake piston hold the bottom edge of the inboard pad.

15. Push down on the inner pad until it lays flat against the caliper. It is important to push the piston all the way into the caliper if new linings are installed or the caliper will not fit over the rotor.

16. Position the outboard pad with the ears of the pad over the caliper ears and the tab at the bottom engaged in the caliper cutout.

17. With the 2 pads in position, place the caliper over the brake disc and align the holes in the caliper with those of the mounting bracket.

NOTE: Make certain that the brake hose is not twisted or kinked.

18. Install the mounting bracket bolts through the sleeves in the inboard caliper ears and through the mounting bracket, making sure that the ends of the bolts pass under the retaining ears on the inboard pad.

19. Tighten the mounting bolts to 35 ft. lbs. Pump the brake pedal to seat the pad against the rotor. Don't do this unless both calipers are in place. Use a pair of channel lock pliers to bend over the upper ears of the outer pad so it isn't loose.

Caliper components—Delco type—except 1988-90 C/K Series

6. Outboard pad

Replacing the disc brake pads—Delco type—except 1988-90 C/K Series

1. Inboard pad
2. Outboard pad
3. Bolt
4. Support key
5. Spring
6. Anti-rattle spring

Replacing the disc brake pads—Bendix type—except 1988-90 C/K Series

Caliper components — Bendix type — except 1988–90 C/K Series

20. Install the front wheel and lower the vehicle.

21. Add fluid to the master cylinder reservoirs so that they are $\frac{1}{4}$ in. (6.35mm) from the top.

22. Test the brake pedal by pumping it to obtain a hard pedal. Check the fluid level again and add fluid as necessary. Do not move the vehicle until a hard pedal is obtained.

BENDIX TYPE

1. Remove approximately $\frac{1}{3}$ of the brake fluid from the master cylinder. Discard the used brake fluid.

2. Raise and support the front of the vehicle safely. Remove the wheel.

3. Push the piston back into its bore. This can be done by using a C-clamp.

4. Remove the bolt at the caliper support key. Use a brass drift pin to remove the key and spring.

5. Rotate the caliper up and forward from the bottom and lift it off the caliper support.

6. Unscrew the brake line at the caliper. Plug the opening. Discard the copper washer. Be careful not to damage the brake line.

7. Remove the outer shoe from the caliper.

To install:

8. Using a new copper washer, connect the brake line at the caliper. Torque the connector to 32 ft. lbs.

9. Lubricate the caliper support and support spring with silicone.

10. Position the outboard shoe in the caliper with the ears at the top of the shoe over the caliper ears and the tab at the bottom of the shoe engaged in the caliper cutout. If assembly is difficult, a C-clamp may be used. Be careful not to mar the lining.

11. Position the caliper over the

brake disc, top edge first. Rotate the caliper downward onto the support.

12. Place the spring over the caliper support key, install the assembly between the support and lower caliper groove. Tap into place until the key retaining screw can be installed.

13. Install the screw and torque to 12–18 ft. lbs. The boss must fit fully into the circular cutout in the key.

14. Install the wheel and add brake fluid as necessary.

1988–90 C/K Series

1. Remove approximately $\frac{1}{3}$ of the brake fluid from the master cylinder. Discard the used brake fluid.

2. Raise and support the front of the vehicle safely.

3. Remove the front wheels and re-install 2 lug nuts to retain the rotor.

4. Remove the brake hose from the caliper by removing the inlet fitting bolt.

5. Use 12 inch adjustable pliers over the inboard brake shoe and the flange on the caliper housing to bottom the piston into the caliper bore.

6. Remove the 2 mounting bolt and sleeve assemblies.

7. Remove the caliper from the rotor and mounting bracket.

NOTE: Do not let the caliper assembly hang by the brake hose.

8. Remove the inboard and outboard shoe.

NOTE: If the pads are to be re-installed, mark them inside and outside.

9. Remove the bolt boots.

10. Remove the mounting bolt seals from the bolt holes in the caliper.

11. Remove the bushings from the grooves in the mounting bolt holes.

To install:

12. Install new, lubricated bushings in the grooves in the mounting bolt holes.

13. Install new bolt boots.

14. Install the inboard shoe and lining by snapping the retainer spring into the piston. The shoe must lay flat against the piston.

15. Install the outboard shoe and lining with the wear sensor at the leading edge of the shoe during forward wheel rotation. The back of the shoe must lay flat against the caliper.

16. Install the caliper over the rotor and in the mounting bracket. Liberally fill both cavities between the bushings in the housing with silicone grease.

17. Install the mounting bolt and sleeve assemblies and torque to 28 ft. lbs.

18. Install the brake hose and torque to 33 ft. lbs. Remove the 2 lug nuts and install the wheels.

1. Bushing
2. Mounting bolt seal
3. Outboard shoe and lining
4. Wear sensor
5. Inboard shoe and lining
6. Caliper housing

Replacing the disc brake pads — 1988–90 C/K Series

19. Pump the brake pedal until a firm pedal is obtained.

Disc Brake Pads

REMOVAL & INSTALLATION

1986 C/K Series, 1987–90 R/V Series and Van

DELCO TYPE

1. Remove the cover on the master cylinder and siphon out $\frac{2}{3}$ of the fluid. This step prevents spilling fluid when the piston is pushed back.

2. Raise and support the front end of the vehicle safely.

3. Remove the wheels.

4. Push the brake piston back into its bore using a C-clamp to pull the caliper outward.

5. Remove the 2 bolts which hold the caliper and then lift the caliper off the disc.

NOTE: Do not let the caliper assembly hang by the brake hose.

6. Remove the inboard and outboard shoe.

NOTE: If the pads are to be re-installed, mark them inside and outside.

7. Remove the pad support spring from the piston.

To install:

8. Position the support spring and the inner pad into the center cavity of the piston. The outboard pad has ears which are bent over to keep the pad in position while the inboard pad has ears on the top end which fit over the caliper retaining bolts. A spring which is inside the brake piston hold the bottom edge of the inboard pad.

9. Push down on the inner pad until it lays flat against the caliper. It is important to push the piston all the way into the caliper if new linings are installed or the caliper will not fit over the rotor.

10. Position the outboard pad with the ears of the pad over the caliper ears and the tab at the bottom engaged in the caliper cutout.

11. With the two pads in position, place the caliper over the brake disc and align the holes in the caliper with those of the mounting bracket.

NOTE: Make certain that the brake hose is not twisted or kinked.

12. Install the mounting bracket bolts through the sleeves in the inboard caliper ears and through the mounting bracket, making sure that the ends of the bolts pass under the retaining ears on the inboard pad.

13. Tighten the mounting bolts to 35 ft. lbs. Pump the brake pedal to seat the pad against the rotor. Don't do this unless both calipers are in place. Use a pair of channel lock pliers to bend over the upper ears of the outer pad so it isn't loose.

14. Install the front wheel and lower the vehicle.

15. Add fluid to the master cylinder reservoirs so that they are $\frac{1}{4}$ in. (6.35mm) from the top.

16. Test the brake pedal by pumping it to obtain a hard pedal. Check the fluid level again and add fluid as necessary. Do not move the vehicle until a hard pedal is obtained.

BENDIX

1. Remove approximately $\frac{1}{3}$ of the brake fluid from the master cylinder. Discard the used brake fluid.

2. Raise and support the vehicle safely and remove the wheel.

3. Push the piston back into its bore. This can be done by using a C-clamp.

4. Remove the bolt at the caliper support key. Use a brass drift pin to remove the key and spring.

5. Rotate the caliper up and forward from the bottom and lift it off the caliper support.

6. Tie the caliper out of the way with a piece of wire. Be careful not to damage the brake line.

7. Remove the inner shoe from the caliper support. Discard the inner shoe clip.

8. Remove the outer shoe from the caliper.

To install:

9. Lubricate the caliper support and support spring, with silicone.

10. Install a new inboard shoe clip on the shoe.

1. Bolt boot
2. Mounting bolt assembly
3. Bushing
4. Mounting bolt seal
5. Outboard shoe and lining

6. Wear sensor
7. Inboard shoe and lining
8. Boot
9. Piston
10. Piston seal
11. Bleeder valve
12. Caliper housing

Caliper components — 1988-90 C/K Series

11. Install the lower end of the inboard shoe into the groove provided in the support. Slide the upper end of the shoe into position. Be sure the clip remains in position.

10. Position the outboard shoe in the caliper with the ears at the top of the shoe over the caliper ears and the tab at the bottom of the shoe engaged in the caliper cutout. If assembly is difficult, a C-clamp may be used. Be careful not to mar the lining.

11. Position the caliper over the brake disc, top edge first. Rotate the caliper downward onto the support.

12. Place the spring over the caliper support key, install the assembly between the support and lower caliper groove. Tap into place until the key retaining screw can be installed.

13. Install the screw and torque to 12-18 ft. lbs. The boss must fit fully into the circular cutout in the key.

14. Install the wheel and add brake fluid as necessary.

1988-90 C/K Series

1. Remove approximately $\frac{1}{3}$ of the brake fluid from the master cylinder. Discard the used brake fluid.

2. Raise and support the front of the vehicle safely.

3. Remove the front wheels and re-install 2 lug nuts to retain the rotor.

4. Remove the brake hose from the caliper by removing the inlet fitting bolt.

5. Use 12 inch adjustable pliers over

the inboard brake shoe and the flange on the caliper housing to bottom the piston into the caliper bore.

6. Remove the 2 mounting bolt and sleeve assemblies.

7. Remove the caliper from the rotor and mounting bracket.

NOTE: Do not let the caliper assembly hang by the brake hose.

8. Remove the inboard and outboard shoe.

NOTE: If the pads are to be re-installed, mark them inside and outside.

9. Remove the bolt boots.

10. Remove the mounting bolt seals from the bolt holes in the caliper.

11. Remove the bushings from the grooves in the mounting bolt holes.

To install:

12. Install new, lubricated bushings in the grooves in the mounting bolt holes.

13. Install new bolt boots.

14. Install the inboard shoe and lining by snapping the retainer spring into the piston. The shoe must lay flat against the piston.

15. Install the outboard shoe and lining with the wear sensor at the leading edge of the shoe during forward wheel rotation. The back of the shoe must lay flat against the caliper.

16. Install the caliper over the rotor and in the mounting bracket. Liberally

fill both cavities between the bushings in the housing with silicone grease.

17. Install the mounting bolt and sleeve assemblies and torque to 28 ft. lbs.

18. Install the brake hose and torque to 33 ft. lbs. Remove the 2 lug nuts and install the wheels.

19. Pump the brake pedal until a firm pedal is obtained.

Brake Rotor

REMOVAL & INSTALLATION

1986 C/K Series, 1987-90 R/V Series and Van

2WD

1. Raise and support the vehicle safely.

2. Remove the brake caliper.

3. Remove the outer wheel bearing.

4. Remove the rotor from the spindle.

5. Reverse procedure to install.

4WD

1. Raise and support the vehicle safely.

2. Remove the locking hubs.

3. Remove the wheel bearing outer locknut, retainer and and wheel bearing inner adjusting nut.

4. Remove the hub and disc assembly and outer wheel bearing.

5. Remove the oil seal and inner bearing cone from the hub using a brass drift and tapping with a hammer. Discard the oil seal.

6. Remove the inner and outer bearing cups using a brass drift and a hammer.

7. Clean, inspect and lubricate all parts as require with a high speed grease.

NOTE: Lubrication must be applied to prevent deterioration before the unit is placed in service.

7. Assemble the outer wheel bearing cup into the wheel hub using a bearing driver tool.

8. Assemble the inner wheel bearing cup into the wheel hub using a bearing driver tool.

9. Pack the wheel bearing cone with a high melting point type wheel bearing grease and insert the cone into the cup.

10. Install the hub and disc and wheel bearings to the spindle.

11. Adjust the wheel bearings.

1988-90 C/K Series

1. Raise and support the vehicle safely.

2. Remove the brake caliper.

3. Remove the cap, cotter pin nut

and washer and remove hub and disc from the spindle.

4. Installation is the reverse of removal. Pack the wheel bearing cone with a high melting point type wheel bearing grease and insert the cone into the cup. Adjust the front wheel bearings.

Brake Drums

REMOVAL & INSTALLATION

Semi-Floating Axles

1. Raise and support the vehicle safely.

2. Mark the relationship of the wheel to the hub and remove the wheel.

3. Mark the relationship of the drum to the hub and pull the drum from the brake assembly. If the brake drums have been scored from worn linings, the brake adjuster must be backed off so that the brake shoes will retract from the drum. The adjuster can be backed off by inserting a brake adjusting tool through the access hole provided. In some cases the access hole is provided in the brake drum. A metal cover plate is over the hole. This may be removed by using a hammer and chisel.

4. To install, reverse the removal procedure.

Full Floating Axles

To remove the drums from full floating rear axles, the axle shaft will have to be removed. Full floating rear axles can readily be identified by the bearing housing protruding through the center of the wheel.

1. Raise and support the vehicle safely.

2. Remove the wheel.

3. Remove the axle shaft.

4. Remove the retaining ring, key and adjusting nut.

5. Remove the hub and drum.

To install:

6. Install the hub and drum to the tube.

7. Install the adjusting nut and torque to 50 ft. lbs. while turning the hub.

8. Install the key and retaining ring.

9. Install the axle shaft and wheel.

Brake Shoes

REMOVAL & INSTALLATION

1. Raise the vehicle and support it safely.

2. Loosen the parking brake equal-

izer enough to remove all tension on the brake cable.

3. Remove the brake drums.

NOTE: The brake pedal must not be depressed while the drums are removed.

4. Using a brake tool, remove the shoe springs.

5. Remove the self-adjuster actuator spring.

6. Remove the link from the secondary shoe by pulling it from the anchor pin.

7. Remove the holddown pins. These are the brackets which run through the backing plate. They can be removed with a pair of pliers. Reach around the rear of the backing plate and hold the back of the pin. Turn the top of the pin retainer 45° with the plier. This will align the elongated tang with the slot in the retainer. Be careful, as the pin is spring loaded and may fly off when released. Use the same procedure for the other pin assembly.

8. Remove the adjuster actuator assembly.

NOTE: Since the actuator, pivot, and override spring are considered an assembly it is not recommended that they be disassembled.

9. Remove the shoes from the backing plate. Make sure that you have a secure grip on the assembly as the bottom spring will still exert pressure on the shoes. Slowly let the tops of the shoes come together and the tension will decrease and the adjuster and spring may be removed.

NOTE: If the linings are to be reused, mark them for identification.

10. Remove the rear parking brake lever from the secondary shoe. Using a pair of plier, pull back on the spring which surrounds the cable. At the same time, remove the cable from the notch in the shoe bracket. Make sure that the spring does not snap back or injury may result.

11. Use a brake cleaning fluid to remove dirt from the brake drum. Check the drums for scoring and cracks. Have the drums checked for out-of-round and service the drums as necessary.

12. Check the wheel cylinders by carefully pulling the lower edges of the wheel cylinder boots away from the cylinders. If there is excessive leakage, the inside of the cylinder will be moist with fluid. If there is any leakage at all, a cylinder overhaul is in order. Do not delay, as a brake failure could result.

NOTE: A small amount of fluid will be present to act as a lubricant for the wheel cylinder pistons.

13. Check the flange plate, which is located around the axle, for leakage of differential lubricant. This condition cannot be overlooked as the lubricant will be absorbed into the brake linings and brake failure will result. Replace the seals as necessary.

NOTE: If new linings are being installed, check them against the old units for length and type.

14. Check the new linings for imperfections.

NOTE: It is important to keep your hands free of dirt and grease when handling the brake shoes. Foreign matter will be absorbed into the linings and result in unpredictable braking.

15. Lightly lubricate the parking brake and cable and the end of the parking brake lever where it enters the shoe. Use high temperature, waterproof, grease or special brake lube.

16. Install the parking brake lever into the secondary shoe with the attaching bolt, spring washer, lockwasher, and nut. It is important that the lever move freely before the shoe is attached. Move the assembly and check for proper action.

17. Lubricate the adjusting screw and make sure that it works freely. Sometimes the adjusting screw will not move due to lack of lubricant or dirt contamination and the brakes will not adjust. In this case, the adjuster should be disassembled, thoroughly cleaned, and lubricated before installation.

18. Connect the brake shoe spring to the bottom portion of both shoes. Make certain that the brake linings are installed in the correct manner, the primary and secondary shoe in the correct position. If you are not sure remove the other brake drum and check it.

19. Install the adjusting mechanism below the spring and separate the top of the shoes. Make the following checks before installation:

a. Be certain that the right hand thread adjusting screw is on the left hand side of the vehicle and the left hand screw is on the right hand side of the vehicle.

b. Make sure that the star adjuster is aligned with the adjusting hole.

c. The adjuster should be installed with the starwheel nearest the secondary shoe and the tension

spring away from the adjusting mechanism;

d. If the original linings are being reused, put them back in their original locations.

20. Install the parking brake cable.

21. Position the primary shoe (the shoe with the short lining) first. Secure it with the holddown pin and with its spring by pushing the pin through the back of the backing plate and, while holding it with one hand, install the spring and the retainer using a pair of needlenose pliers. Install the adjuster actuator assembly.

22. Install the parking brake strut and the strut spring by pulling back the spring with pliers and engaging the end of the cable onto the brake strut and then releasing the spring.

23. Place the small metal guide plate over the anchor pin and position the self-adjuster wire cable eye.

NOTE: The wire should not be positioned with the conventional brake installation tool or damage will result. It should be positioned on the actuator assembly first and then placed over the anchor pin stud by hand with the adjuster assembly in full downward position.

24. Install the actuator return spring. Do not pry the actuator lever to install the return spring. Position it using the end of a screwdriver or another suitable tool.

NOTE: If the return springs are bent or in any way distorted, they should be replaced.

25. Using the brake installation tool, place the brake return springs in position. Install the primary spring first over the anchor pin and then place the spring from the secondary shoe over the wire link end.

26. Pull the brake shoes away from the backing plate and apply a thin coat of high temperature, waterproof, grease or special brake lube in the brake shoe contact points.

NOTE: Only a small amount is necessary. Keep the lubricant away from the brake linings.

27. Once the complete assembly has been installed, check the operation of the self-adjusting mechanism by moving the actuating lever by hand.

28. Adjust the brakes.

a. Turn the star adjuster until the drum slides over the brake shoes with only a slight drag.

b. With the drum and wheel installed turn the adjusting screw until the wheel can be just be turned by hand. The brake drag should be equal at both wheels.

c. Back of the adjusting screw 33 notches. The brakes should have no drag after the screw has been backed off about 15 notches.

NOTE Avoid overtightening the lug nuts to prevent damage to the brake drum. Alloy wheels can also be cracked by overtightening. Use of a torque wrench is highly recommended.

d. If the adjusting hole in the drum has been punched out, make certain that the insert has been removed from the inside of the drum. Install a rubber hole cover to keep dirt out of the brake assembly. Also, be sure that the drums are installed in the same position as they were when removed, with the locating tang in line with the locating hole in the axle shaft flange.

e. Make the final adjustment by backing the vehicle and pumping the brakes until the self-adjusting mechanisms adjust to the proper level and the brake pedal reaches satisfactory height.

29. Adjust the parking brake.

Wheel Cylinders

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely.

2. Remove the wheel.

3. Back off the brake adjustment if necessary and remove the drum.

4. Disconnect and plug the brake line.

5. Remove the brake shoe pull-back springs and shoes as necessary.

6. Remove the bolts securing the wheel cylinder to the backing plate.

7. Disengage the wheel cylinder pushrods from the brake shoes and remove the wheel cylinder.

8. Installation is the reverse of removal. Bleed the system.

Parking Brake Cable

REMOVAL & INSTALLATION

Front Cable

1. Raise and support the vehicle safely.

2. Remove adjusting nut from equalizer.

3. Remove retainer clip from rear portion of front cable at frame and from lever arm.

4. Disconnect front brake cable from parking brake pedal or lever assemblies. Remove front brake cable. On some models, it may assist installation of new cable if a heavy cord is tied to other end of cable in order to guide new cable through proper routing.

Exploded view of the rear drum brake assembly—Duo-Servo type

5. Install cable by reversing removal procedure.
6. Adjust parking brake.

Center Cable

1. Raise and support the vehicle safely.
2. Remove adjusting nut from equalizer.
3. Unhook connector at each end and disengage hooks and guides.
4. Install new cable by reversing removal procedure.
5. Adjust parking brake.
6. Apply parking brake 3 times with heavy pressure and repeat adjustment.

Rear Cable

1. Raise and support the vehicle safely.
2. Remove rear wheel and brake drum.
3. Loosen adjusting nut at equalizer.
4. Disengage rear cable at connector.
5. Bend retainer fingers.
6. Disengage cable at brake shoe operating lever.
7. Install new cable by reversing removal procedure.
8. Adjust parking brake.

ADJUSTMENT

The rear brakes serve a dual purpose. They are used as service brakes and as parking brakes. To obtain proper adjustment of the parking brake, the service brakes must first be properly adjusted as outlined earlier.

1986 C/K Series, 1987-90 R/V Series and Van

FOOT PEDAL TYPE

1. Apply the parking brake 4 notches from the fully released position.
2. Raise and support the vehicle.
3. Loosen the jam nut at the equalizer.
4. Tighten or loosen the adjusting nut until a light drag is felt when the rear wheels are rotated forward.
5. Tighten the check nut.
6. Release the parking brake and rotate the rear wheels. No drag should be felt. If even a light drag is felt, readjust the parking brake.
7. Lower the vehicle.

NOTE: If a new parking brake cable is being installed, pre-stretch it by applying the parking brake hard about three times before making adjustments.

LEVER TYPE

1. Raise and support the vehicle safely. Turn the adjusting knob on the parking brake lever counterclockwise until it stops.
2. Apply the parking brake. Loosen the equalizer nut.
3. Tighten the equalizer nut until light drag is felt while rotating the rear wheels in the forward motion.
4. Adjust the knob on the parking brake lever until a definite snap over center is felt.
5. Release the parking brake. Rotate the rear wheels in the forward motion. There should be no brake drag.

DRIVESHAFT TYPE

1. Raise and support the vehicle safely. Remove the clevis pin connecting the pull rod and the relay lever.
2. Rotate the brake drum to align the access hole with the adjusting screw. If the vehicle is equipped with manual transmission the access hole is located at the bottom of the backing plate. If the vehicle is equipped with automatic transmission the access hole is located at the top of the shoe.
3. For first time adjustment it will be necessary to remove the driveshaft and the drum in order to remove the lanced area from the drum and clean out the metal shavings.
4. Adjust the screw until the drum cannot be rotated by hand. Back off the adjusting screw ten notches, the drum should rotate freely.
5. Position the parking brake lever in the fully released position. Take up the slack in the cable to overcome spring tension.
6. Adjust the clevis of the pull rod to align with the hole in the relay lever. Install the clevis pin. Install a new cover in the drum access hole.

1988-90 C/K Series

1. Raise and support the vehicle safely. Matchmark the wheel to the axle flange. Remove the tire and wheel assembly.
2. Matchmark the drum to the axle flange. Remove the brake drum.
3. Using tool J-21177A, or equivalent, measure and record the brake drum inside diameter.
4. Turn the adjuster nut and adjust the shoe and lining to a diameter 0.010-0.020 in. less than the measured inside diameter of the brake drum.
5. Be sure that the stops on the parking brake levers are against the edge of the brake shoe web. If not, loosen the parking brake cable adjustment.
6. Tighten the parking brake cable at the adjuster nut until the lever

stops begin to move off of the shoe webs. Loosen the adjustment nut until the lever stops move back, barely touching the shoe webs. The final clearance between the stops and either web should be 0.5mm.

7. Install the drums and wheels. Align the assemblies with the matchmarks made during removal.
8. Apply and release the service brake pedal 30-35 times using normal pedal force. Pause about one second between each pedal application.
9. Depress the parking brake six clicks. Check the rear wheels they should not rotate.
10. Release the parking brake lever. Check for free wheel rotation.

FRONT SUSPENSION

Shock Absorbers

REMOVAL & INSTALLATION

1986 C Series, 1987-90 R Series and Van

1. Raise and support the vehicle safely. Properly support the lower control arm assembly, as required. Remove the tire and wheel assembly.
2. Remove the upper shock absorber retaining bolt. Remove the lower shock absorber retaining bolt. Vehicles equipped with quad shocks have a spacer between them.
3. Remove the shock absorber from the vehicle.
4. Installation is the reverse of the removal procedure. On the R series vehicle, torque the upper end nut to 140 ft. lbs.; the lower end bolt to 59 ft. lbs. On the Van, torque the bolts to 80 ft. lbs.

1986 K Series, 1987-90 V Series

1. Raise and support the vehicle safely.
2. Remove the nuts and eye bolts securing the upper and lower shock absorber eyes. Quad shocks have a spacer between the lower end bushings.
3. Remove the shock absorber(s) and inspect the rubber eye bushings. If these are defective, replace the shock absorber assembly.
4. Installation is the reverse of removal. Make sure that the spacer is installed at the bottom end on quad shocks. Torque the upper end nut to 65 ft. lbs. On dual shocks, torque the lower end to 65 ft. lbs. On quad shocks, torque the lower end to 89 ft. lbs.

1988-90 C Series

1. Remove the upper shock absorber retaining bolt. Raise and support the vehicle safely.

2. Properly support the lower control arm, as required. Remove the lower shock absorber retaining bolt.

3. Remove the shock absorber from the vehicle.

4. Installation is the reverse of removal. Tighten the upper nut to 8 ft. lbs. (96 inch lbs.); tighten the lower mounting bolts to 20 ft. lbs.

1988-90 K Series

1. Raise and support the vehicle safely.

2. Remove the upper end bolt, nut and washer.

3. Remove the lower end bolt, nut and washer.

4. Remove the shock absorber and inspect the rubber bushings. If these are defective, replace the shock absorber assembly.

5. Installation is the reverse of removal. Torque the both nuts to 48 ft. lbs. Make sure that the bolts are inserted in the proper direction. The bolt head on the upper end should be forward; the bottom end bolt head is rearward.

Coil Springs

REMOVAL & INSTALLATION

1986 C Series, 1987-90, R Series and Van

1. Raise and support the vehicle safely under the frame rails. The control arms should hang freely.

2. Remove the wheel.

3. Disconnect the shock absorber at the lower end and move it aside.

4. Disconnect the stabilizer bar from the lower control arm.

5. Support the lower control arm and install a spring compressor on the spring, or chain the spring to the control arm as a safety precaution.

NOTE: On vehicles with an air cylinder inside the spring, remove the valve core from the cylinder and expel the air by compressing the cylinder with a prybar. With the cylinder compressed, replace the valve core so that the cylinder will stay in the compressed position. Push the cylinder as far as possible towards the top of the spring.

6. Raise the jack to remove the tension from the lower control arm cross-shaft and remove the two U-bolts securing the cross-shaft to the crossember.

NOTE: The cross-shaft and lower control arm keeps the coil spring compressed. Use care when lowering the assembly.

7. Slowly release the jack and lower the control arm until the spring can be removed. Be sure that all compression is relieved from the spring.

8. If the spring was chained, remove the chain and spring. If you used spring compressors, remove the spring and slowly release the compressors.

9. Remove the air cylinder, if so equipped.

To install:

10. Install the air cylinder so that the protector plate is towards the upper control arm. The schrader valve should protrude through the hole in the lower control arm.

11. Install the chain and spring. If you used spring compressors, install the spring and compressors.

12. Slowly raise the jack and lower the control arm. Line up the indexing hole in the shaft with the crossmember attaching studs.

13. Install the two U-bolts securing the cross-shaft to the crossember. Torque the nuts to 65 ft. lbs on the Van and 85 ft. lbs on all others.

14. Remove the jack.

15. Connect the stabilizer bar to the lower control arm. Torque the nuts to 24 ft. lbs.

16. Connect the shock absorber at the lower end. Torque the bolt to 80 ft. lbs. on the Van and 59 ft. lbs. on all others.

17. If equipped with air cylinders, inflate the cylinder to 60 psi.

18. Install the wheel.

19. Lower the vehicle. Once the weight of the vehicle is on the wheels, reduce the air cylinder pressure to 50 psi.

20. Check the alignment checked.

1988-90 C Series

1. Raise and support the vehicle safely. Allow the control arms to hang free. Remove the tire and wheel assembly. Remove the shock absorber assembly, as required.

2. With the vehicle supported so that the control arms hang free, install tool J-23028. Secure the tool using a suitable jack. Install a safety chain around the spring and through the lower control arm.

3. Remove the stabilizer shaft from the lower control arm. Raise the jack and remove the tension on the lower control arm bolts.

4. Remove the lower control arm rear bolt, then remove the other retaining bolt.

5. Lower the jack and allow the lower control arm to hang free. Remove the spring assembly from the vehicle.

To install:

6. Install the chain and spring. If you used spring compressors, install the spring and compressors.

a. Make sure that the insulator is in place.

b. Make sure that the tape is at the lower end. New springs will have an identifying tape.

c. Make sure that the gripper notch on the top coil is in the frame bracket.

d. Make sure that on drain hole in the lower arm is covered by the bottom coil and the other is open.

7. Slowly raise the jack and lower the control arm. Guide the control arm into place with a prybar.

8. Install the pivot shaft bolts, front one first. The bolts must be installed with the heads towards the front of the vehicle. Remove the safety chain or spring compressors.

NOTE: Do not torque the bolts yet. The bolts must be torque with the vehicle at its proper ride height.

9. Remove the jack.

10. Connect the stabilizer bar to the lower control arm. Torque the nuts to 13 ft. lbs.

11. Install the shock absorber.

12. Install the wheel.

13. Lower the vehicle. Once the weight of the vehicle is on the wheels:

a. Lift the front bumper about 38mm and let it drop.

b. Repeat this procedure 2 or 3 more times.

c. Draw a line on the side of the lower control arm from the centerline of the control arm pivot shaft, dead level to the outer end of the control arm.

d. Measure the distance between the lowest corner of the steering knuckle and the line on the control arm. Record the figure.

e. Push down about 38mm on the front bumper and let it return. Repeat the procedure 2 or 3 more times.

f. Re-measure the distance at the control arm.

g. Determine the average of the 2 measurements. The average distance should be 73.6mm $\pm$ 6mm.

h. If the figure is correct, tighten the control arm pivot nuts to 96 ft. lbs.

i. If the figure is not correct, tighten the pivot bolts to 96 ft. lbs. and have the front end alignment corrected.

Leaf Spring

REMOVAL & INSTALLATION

1986 K Series and 1987-90 V Series

1. Raise and support the vehicle safely so that all tension is taken off of the front suspension.

2. Remove the shackle retaining bolts, nuts and spacers.

3. Remove the front spring-to-frame bracket bolt, washer and nut.

4. On the 10/1500 and 20/2500 both sides and the 30/3500 left side: remove the U-bolt nuts, washers, U-bolts, plate and spacers.

5. On the 30/3500 right side: remove the inboard spring plate bolts, U-bolt nuts, washers, U-bolt, plate and spacers.

To replace the bushing, place the spring in a press or vise and press out the bushing. Press in the new bushing. The new bushing should protrude evenly on both sides of the spring.

6. Installation is the reverse of removal. Coat all bushings with silicone grease prior to installation. Install all bolts and nuts finger-tight. When all fasteners are installed, torque the bolts. Torque the U-bolt nuts, including the inboard right side 30/3500 series bolts, in the crisscross pattern shown, to 150 ft. lbs. Torque the shackle nuts to 50 ft. lbs. Torque the front eye bolt nut to 90 ft. lbs.

Torsion Bar

REMOVAL & INSTALLATION

1988 K Series

1. Raise and support the vehicle safely.

2. Remove the torsion bar adjusting screw. Record the number of turns on the adjusting bolt for reinstallation.

3. Remove the support retainer retaining bolts.

4. Slide the torsion bar forward in the lower control arm until the torsion bar clears the support. Pull down on the bar and remove it from the control arm.

5. Remove the required components and remove the torsion bar from the vehicle.

6. Installation is the reverse of the removal procedure. The gap between the torsion bar adjusting arm and the support assembly should not exceed 1.3 in.

7. Tighten the bolts to 35 ft. lbs. and the bolt/screw to 33 ft. lbs. Check and adjust front alignment, as required.

1989-90 K Series

1. Raise and support the vehicle safely.

2. Remove the wheels.

3. Support the lower control arm with a floor jack.

4. Matchmark the both torsion bar adjustment bolt positions.

5. Using tool J-36202, increase the tension on the adjusting arm.

6. Remove the adjustment bolt and retaining plate.

7. Move the tool aside.

8. Slide the torsion bars forward.

9. Remove the adjusting arms.

10. Remove the nuts and bolts from the torsion bar support crossmember and slide the support crossmember rearwards.

11. Matchmark the position of the torsion bars and note the markings on the front end of each bar. They are not interchangeable. Remove the torsion bars.

12. Remove the support crossmember.

13. Remove the retainer, spacer and bushing from the support crossmember.

To install:

14. Assemble the retainer, spacer and bushing on the support.

15. Position the support assembly on the frame, out of the way.

16. Align the matchmarks and install the torsion bars, sliding them forward until they are supported.

17. Install the adjuster arms on the torsion bars.

18. Bolt the support crossmember into position. Torque the center nut to 18 ft. lbs.; the edge nuts to 46 ft. lbs.

19. Install the adjuster retaining plate and bolt on each torsion bar.

20. Using tool J-36202, increase tension on both torsion bars.

21. Install the adjustment retainer plate and bolt on both torsion bars.

22. Set the adjustment bolt to the marked position.

23. Release the tension on the torsion bar until the load is taken up by the adjustment bolt.

24. Remove the tool.

25. Install the wheels.

26. Check the front end alignment.

Upper Ball Joint

REMOVAL & INSTALLATION

1986 C Series, 1987-90, R Series and Van

1. Raise and support the vehicle safely. Properly support the lower control arm, using the necessary equipment. The control arm must be supported so that the spring and the control arm remain intact.

2. Remove the wheel assembly. Remove the brake caliper and position it to the side.

3. Remove the cotter pin and the upper ball joint retaining bolt. Using the proper tool separate the upper joint from its mounting. Support the knuckle assembly so that its weight will not damage the brake hose.

4. Remove the rivets from the ball joint assembly, using the proper tools. Remove the ball joint from the upper control arm.

To install:

5. Start the new ball joint into the control arm. Position the bleed vent in the rubber boot facing inward.

6. Turn the screw until the ball joint is seated in the control arm.

7. Lower the upper arm and match the steering knuckle to the lower ball stud.

8. Install the brake caliper, if removed.

9. Install the ball stud nut and torque it to 80-100 ft. lbs. plus the additional torque necessary to align the cotter pin hole. Do not exceed 130 ft. lbs. or back the nut off to align the holes with the pin.

10. Install a new lube fitting and lubricate the new joint.

11. Install the tire and wheel.

12. Lower the vehicle.

1986 K Series and 1987-90 V Series

1. Raise and support the vehicle safely. Remove the tire and wheel assembly.

2. Remove the hub and rotor assembly. Remove the spindle.

3. Remove the steering knuckle assembly. If removing the left axle yoke ball joints, remove the steering arm. Position the steering knuckle assembly in a suitable vise.

4. The lower ball joint must be removed before service can be performed on the upper ball joint. first. Press the lower ball joint from the knuckle assembly, using the proper tools.

5. Press the upper ball joint from the knuckle assembly, using the proper tools.

6. Installation is the reverse of the removal procedure. Check and adjust front alignment, as required.

1988-90 C Series

1. Raise and support the vehicle safely. Properly support the lower control arm, using the necessary equipment. The control arm must be supported so that the spring and the control arm remain intact.

2. Remove the tire and wheel assembly. Remove the brake caliper and position it to the side.

3. Remove the cotter pin and the upper ball joint retaining bolt. Using the proper tool separate the upper joint from its mounting. Support the knuckle assembly so that its weight will not damage the brake hose.

4. Remove the rivets from the ball joint assembly, using the proper tools. Remove the ball joint from the upper control arm.

To install:

5. Install the replacement ball joint in the control arm, using the bolts and nuts supplied. Torque the nuts to 17 ft. lbs. for 15 and 25 Series; 52 ft. lbs. for 35 Series.

6. Position the ball stud in the knuckle. Make sure it is squarely seated. Torque the ball stud nut to 90 ft. lbs.

7. Install a new cotter pin.

8. Install a new lube fitting and lubricate the new joint.

9. If removed, install the brake caliper.

10. Install the wheel and lower the vehicle.

INSPECTION

1. Raise and support the vehicle so that the control arms hang free.

2. Remove the wheel.

3. Support the lower control arm with a jackstand and disconnect the upper ball stud from the steering knuckle.

4. The upper ball joint is spring loaded in its socket. If it has any perceptible lateral shake or can be twisted in its socket, it should be replaced.

1988-90 K Series

1. Raise and support the vehicle safely.

2. Remove the wheel.

3. Unbolt the brake hose bracket from the control arm.

4. Using a 1/8 in. drill bit, drill a pilot hole through each ball joint rivet.

5. Drill out the rivets with a 1/2 in. drill bit. Punch out any remaining rivet material.

6. Remove the cotter pin and nut from the ball stud.

7. Support the lower control arm with a floor jack.

8. Using a screw-type forcing tool, separate the ball joint from the knuckle.

To install:

9. Position the new ball joint on the control arm.

NOTE: Service replacement ball joints come with nuts and bolts to replace the rivets.

10. Install the bolts and nuts. Tighten the nuts to 17 ft. lbs. for 15 and 25 Series; 52 ft. lbs. for 35 Series.

NOTE: The bolts are inserted from the bottom.

11. Start the ball stud into the knuckle. Make sure it is squarely seated. Install the ball stud nut and pull the ball stud into the knuckle with the nut. Don't final-torque the nut yet.

12. Install the wheel.

13. Lower the vehicle. Once the weight of the vehicle is on the wheels:

a. Lift the front bumper about 38mm and let it drop.

b. Repeat this procedure 2 or 3 more times.

c. Draw a line on the side of the lower control arm from the centerline of the control arm pivot shaft, dead level to the outer end of the control arm.

d. Measure the distance between the lowest corner of the steering knuckle and the line on the control arm. Record the figure.

e. Push down about 38mm on the front bumper and let it return. Repeat the procedure 2 or 3 more times.

f. Re-measure the distance at the control arm.

g. Determine the average of the 2 measurements. The average distance should be 73.6mm $\pm$ 6mm.

h. If the figure is correct, tighten the control arm pivot nuts to 94 ft. lbs.

i. If the figure is not correct, tighten the pivot bolts to 94 ft. lbs. and have the front end alignment corrected.

Lower Ball Joint

REMOVAL & INSTALLATION

1986 C Series, 1987-90, R Series and Van

1. Raise and support the vehicle safely. Properly support the lower control arm, using the necessary equipment. The control arm must be supported so that the spring and the control arm remain intact.

2. Remove the tire and wheel assembly. As required, remove the brake caliper and position it to the side.

3. Remove the cotter pin and the lower ball joint retaining bolt. Using the proper tool separate the ball joint from its mounting. Support the knuckle assembly so that its weight will not damage the brake hose.

4. Press the ball joint out of the lower control arm, using the proper tools.

To install:

5. Start the new ball joint into the control arm. Position the bleed vent in the rubber boot facing inward.

6. Turn the screw until the ball joint is seated in the control arm.

7. Lower the upper arm and match the steering knuckle to the lower ball stud.

8. Install the brake caliper, if removed.

9. Install the ball stud nut and torque it to 80-100 ft. lbs. plus the additional torque necessary to align the cotter pin hole. Do not exceed 130 ft. lbs. or back the nut off to align the holes with the pin.

10. Install a new lube fitting and lubricate the new joint.

11. Install the tire and wheel.

12. Lower the vehicle.

1988-90 C Series

1. Raise and support the vehicle safely. Properly support the lower control arm, using the necessary equipment. The control arm must be supported so that the spring and the control arm remain intact.

2. Remove the tire and wheel assembly. As required, remove the brake caliper and position it to the side.

3. Remove the cotter pin and the lower ball joint retaining bolt. Using the proper tool separate the ball joint from its mounting. Support the knuckle assembly so that its weight will not damage the brake hose.

4. Remove the rivets from the ball joint assembly, using the proper tools. Remove the ball joint from the control arm.

To install:

5. Start the new ball joint into the control arm.

6. Force the ball joint into position using a screw-type forcing tool. The ball joint will bottom in the control arm. The grease seal should face inboard.

7. Start ball stud into the knuckle. Install the nut and tighten it to 90 ft. lbs. Advance the nut to align the cotter pin hole and insert the new cotter pin. Never back off the nut to align the cotter pin hole; always advance it!

8. Install the brake caliper, if removed.

9. Install a new lube fitting and lubricate the new joint.

10. Install the wheel.

11. Lower the vehicle.

12. Check the front end alignment.

INSPECTION

1. Support the weight of the control arm at the wheel hub.

2. Measure the distance between the tip of the ball joint stud and the grease fitting below the ball joint.

3. Move the support to the control arm and allow the hub and drum to hang free. Measure the distance again. If the variation between the 2 mea-

surements exceeds $\frac{3}{32}$ in. (2.38mm) the ball joint should be replaced.

1988-90 K Series

1. Raise and support the vehicle safely.
2. Remove the wheel.
3. Remove the splash shield from the knuckle.
4. Disconnect the the inner tie rod end from the relay rod using a ball joint separator.
5. Remove the hub nut and washer. Insert a long drift or dowel through the vanes in the brake rotor to hold the rotor in place.
6. Remove the axle shaft inner flange bolts.
7. Using a puller, force the outer end of the axle shaft out of the hub. Remove the shaft.
8. Using a $\frac{1}{8}$ in. drill bit, drill a pilot hole through each ball joint rivet.
9. Drill out the rivets with a $\frac{1}{2}$ in. drill bit. Punch out any remaining rivet material.
10. Remove the cotter pin and nut from the ball stud.
11. Support the lower control arm with a floor jack.
12. Matchmark the both torsion bar adjustment bolt positions.
13. Using tool J-36202, increase the tension on the adjusting arm.
14. Remove the adjustment bolt and retaining plate.
15. Move the tool aside.
16. Slide the torsion bars forward.
17. Using a screw-type forcing tool, separate the ball joint from the knuckle.

To install:

18. Position the new ball joint on the control arm.

NOTE: Service replacement ball joints come with nuts and bolts to replace the rivets.

19. Install the bolts and nuts. Tighten the nuts to 45 ft. lbs.

NOTE: The bolts are inserted from the bottom.

20. Start the ball stud into the knuckle. Make sure it is squarely seated. Install the ball stud nut and pull the ball stud into the knuckle with the nut. Don't final-torque the nut yet.
21. Using tool J-36202, increase tension on both torsion bars.
22. Install the adjustment retainer plate and bolt on both torsion bars.
23. Set the adjustment bolt to the marked position.
24. Release the tension on the torsion bar until the load is take up by the adjustment bolt.

25. Remove the tool.
26. Position the shaft in the hub and install the washer and hub nut. Leave the drift in the rotor vanes and tighten the hub nut to 175 ft. lbs.
27. Install the flange bolts. Tighten them to 59 ft. lbs. Remove the drift.
28. Connect the inner tie rod end at the steering relay rod. Torque the nut to 35 ft. lbs.
29. Install the splash shield.
30. Install the wheel.
31. Lower the vehicle. Once the weight of the vehicle is on the wheels:
 - a. Lift the front bumper about 38mm and let it drop.
 - b. Repeat this procedure 2 or 3 more times.
 - c. Draw a line on the side of the lower control arm from the centerline of the control arm pivot shaft, dead level to the outer end of the control arm.
 - d. Measure the distance between the lowest corner of the steering knuckle and the line on the control arm. Record the figure.
 - e. Push down about 38mm on the front bumper and let it return. Repeat the procedure 2 or 3 more times.
 - f. Re-measure the distance at the control arm.
 - g. Determine the average of the 2 measurements. The average distance should be 73.6mm $\pm$ 6mm.
 - h. If the figure is correct, tighten the control arm pivot nuts to 94 ft. lbs.
 - i. If the figure is not correct, tighten the pivot bolts to 94 ft. lbs. and have the front end alignment corrected.

Upper and Lower Ball Joint

REMOVAL & INSTALLATION

1986 K Series and 1987-90 V Series

1. Raise and support the vehicle safely.
2. Remove the wheels.
3. Remove the locking hubs.
4. Remove the spindle.
5. Disconnect the tie rod end from the knuckle.
6. Remove the knuckle-to-steering arm nuts and adapters.
7. Remove the steering arm from the knuckle.
8. Remove the cotter pins and nuts from the upper and lower ball joints.

NOTE: Do not remove the adjusting ring from the knuckle. If it

is necessary to loosen the ring to remove the knuckle, don't loosen it more than 2 threads. The non-hardened threads in the yoke can be easily damaged by the hardened threads in the adjusting ring if caution is not used during knuckle removal

9. Insert the wedge-shaped end of the heavy prybar, or wedge-type ball joint tool, between the lower ball joint and the yoke. Drive the prybar in to break the knuckle free.
10. Repeat the procedure at the upper ball joint.
11. Lift off the knuckle.
12. Secure the knuckle in a vise.
13. Remove the snapping from the lower ball joint. Using tools J-9519-30, J-23454-1 and J-23454-4, or their equivalent screw-type forcing tool, force the lower ball joint from the knuckle.
14. Using tools J-9519-30, J-23454-3 and J-23454-4, or their equivalent screw-type forcing tool, force the upper ball joint from the knuckle.

To install:

15. Position the lower ball joint (the one without the cotter pin hole) squarely in the knuckle. Using tools J-9519-30, J-23454-2 and J-23454-3, or their equivalent screw-type forcing tool, force the lower ball joint into the knuckle until it is fully seated.
16. Install the snapping.
17. Position the upper ball joint (the one with the cotter pin hole) squarely in the knuckle. Using tools J-9519-30, J-23454-2 and J-23454-3, or their equivalent screw-type forcing tool, force the upper ball joint into the knuckle until it is fully seated.
18. Position the knuckle on the yoke.
19. Start the ball joints into their sockets. Place the nuts onto the ball studs. The nut with the cotter pin slot is the upper nut. Tighten the lower nut to 30 ft. lbs., for now.
20. Using tool J-23447, tighten the adjusting ring to 50 ft. lbs.
21. Tighten the upper nut to 100 ft. lbs. Install a new cotter pin. Never loosen the nut to align the cotter pin hole; always tighten it.
22. Tighten the lower nut to 70 ft. lbs.
23. Attach the steering arm to the knuckle using adapters and new nuts. Torque the nuts to 90 ft. lbs.
24. Connect the tie rod end to the knuckle.
25. Install the spindle.
26. Install the hub/rotor assembly and wheel bearings. Adjust the bearings.
27. Install the locking hubs.
28. Install the wheel.
29. Check the front end alignment.

Upper Control Arm

REMOVAL & INSTALLATION

1986 C Series, 1987-90 R Series and Van

1. Note and record the amount of shims. These shims must be installed in the same location as removed. Remove the nuts and the shims.

2. Raise and support the vehicle safely. Properly support the lower control arm, using the necessary equipment. The control arm must be supported so that the spring and the control arm remain intact.

3. Remove the tire and wheel assembly. Remove the brake caliper assembly and position it to the side. Loosen the upper ball joint from the steering knuckle, using the proper tool. Support the hub assembly.

4. Remove the upper control arm retaining bolts. Remove the upper control arm from the vehicle.

To install:

5. Place the control arm in position and install the nuts. Before tightening the nuts, insert the caster and camber shims in the same order as when installed.

6. Install the nuts securing the control arm shaft studs to the crossmember bracket. Tighten the nuts to 70 ft. lbs. for 10/1500 and 20/2500 series; 105 ft. lbs. for 30/3500 series.

7. Install the ball stud nut. Torque the nut to 90 ft. lbs. for 10/1500 series and 20/2500 series; 130 ft. lbs. for 30/3500 series.

8. Install the cotter pin. Never back off the nut to install the cotter pin. Always advance it.

9. Install the brake caliper. Remove the spring compressor.

10. Install the wheel.

11. Check the front end alignment.

1988-90 C/K Series

1. Raise and support the vehicle safely.

2. Support the lower control arm with a floor jack.

3. Remove the wheel.

4. Unbolt the brake hose bracket from the control arm.

5. Remove the air cleaner extension.

6. Remove the cotter pin from the upper control arm ball stud and loosen the stud nut until the bottom surface of the nut is slightly below the end of the stud.

7. Install a spring compressor on the coil spring for safety.

8. Using a screw-type forcing tool, break loose the ball joint from the knuckle.

9. Remove the nuts and bolts securing the control arm to the frame brackets.

10. Tape the shims and spacers together and tag for proper reassembly. The 35 Series bushings are replaceable. The 15/25 Series bushings are welded in place.

To install:

11. Place the control arm in position and install the shims, bolts and new nuts. Both bolt heads must be inboard of the control arm brackets. Tighten the nuts finger tight for now.

NOTE: Do not torque the bolts yet. The bolts must be torque with the vehicle at its proper ride height.

12. Install the ball stud nut. Torque the nut to 90 ft. lbs. Install the cotter pin. Never back off the nut to install the cotter pin. Always advance it.

13. Install the brake caliper.

14. Remove the spring compressor or safety chain.

15. Install the wheel.

16. Install the brake hose.

17. Install the air cleaner extension.

18. Install the battery ground cable.

19. Lower the vehicle. Once the weight of the vehicle is on the wheels:

a. Lift the front bumper about 38mm and let it drop.

b. Repeat this procedure 2 or 3 more times.

c. Draw a line on the side of the lower control arm from the centerline of the control arm pivot shaft, dead level to the outer end of the control arm.

d. Measure the distance between the lowest corner of the steering knuckle and the line on the control arm. Record the figure.

e. Push down about 38mm on the front bumper and let it return. Repeat the procedure 2 or 3 more times.

f. Re-measure the distance at the control arm.

g. Determine the average of the 2 measurements. The average distance should be 73.6mm $\pm$ 6mm.

h. If the figure is correct, tighten the control arm pivot nuts to 88 ft. lbs.

i. If the figure is not correct, tighten the pivot bolts to 88 ft. lbs. and check the front end alignment.

Lower Control Arm

REMOVAL & INSTALLATION

1986 C Series, 1987-90 R Series and Van

1. Raise and support the vehicle safely. Properly support the lower con-

trol arm assembly. Remove the tire and wheel assembly. Remove the brake caliper and position it to the side.

2. Remove the coil spring. Remove the lower ball joint cotter pin and retaining nut. Using the proper tool, separate the lower ball joint from the steering knuckle.

3. Remove the lower control arm from the vehicle.

To install:

4. Install the lower control arm. Torque the U-bolts to 85 ft. lbs.

5. Install the ball stud nut. Torque the nut to 90 ft. lbs. for 10/1500 series and 20/2500 series; 130 ft. lbs. for 30/3500 series. Install the cotter pin. Never back off the nut to install the cotter pin. Always advance it.

6. Install the brake caliper.

7. Install the spring.

1988-90 C Series

1. Raise and support the vehicle safely. Remove the tire and wheel assembly. Properly support the lower control arm assembly. Remove the coil spring.

2. Remove the lower ball joint cotter pin and retaining nut. Using the proper tool, separate the lower ball joint from the steering knuckle.

3. Remove the lower control arm from the vehicle.

To install:

4. Slowly raise the jack and lower the control arm. Guide the control arm into place with a prybar.

5. Install the pivot shaft bolts, front one first. The bolts must be installed with the heads towards the front of the vehicle. Remove the safety chain or spring compressors.

NOTE: Do not torque the bolts yet. The bolts must be torque with the vehicle at its proper ride height.

6. Remove the jack.

7. Connect the stabilizer bar to the lower control arm. Torque the nuts to 13 ft. lbs.

8. Install the shock absorber.

9. Install the wheel.

10. Lower the vehicle. Once the weight of the vehicle is on the wheels:

a. Lift the front bumper about 38mm and let it drop.

b. Repeat this procedure 2 or 3 more times.

c. Draw a line on the side of the lower control arm from the centerline of the control arm pivot shaft, dead level to the outer end of the control arm.

d. Measure the distance between the lowest corner of the steering knuckle and the line on the control arm. Record the figure.

e. Push down about 38mm on the front bumper and let it return. Repeat the procedure 2 or 3 more times.

f. Re-measure the distance at the control arm.

g. Determine the average of the 2 measurements. The average distance should be $73.6\text{mm} \pm 6\text{mm}$.

h. If the figure is correct, tighten the control arm pivot nuts to 96 ft. lbs.

i. If the figure is not correct, tighten the pivot bolts to 96 ft. lbs. and have the front end alignment corrected.

1988-90 K Series

1. Raise and support the vehicle safely.

2. Remove the wheel.

3. Remove the splash shield from the knuckle.

4. Disconnect the stabilizer bar from the control arm.

5. Remove the shock absorber.

6. Disconnect the tie rod end from the relay rod.

7. Remove the hub nut and washer. Insert a long drift or dowel through the vanes in the brake rotor to hold the rotor in place.

8. Remove the axle shaft inner flange bolts.

9. Using a puller, force the outer end of the axle shaft out of the hub. Remove the shaft.

10. Support the lower control arm with a floor jack.

11. Matchmark the both torsion bar adjustment bolt positions.

12. Using tool J-36202, increase the tension on the adjusting arm.

13. Remove the adjustment bolt and retaining plate.

14. Move the tool aside.

15. Slide the torsion bars forward.

16. Remove the adjusting arm.

17. Remove the cotter pin from the lower ball stud and loosen the nut.

18. Loosen the lower ball stud in the steering knuckle using a ball joint stud removal tool. When the stud is loose, remove the nut from the stud. It may be necessary to remove the brake caliper and wire it to the frame to gain clearance.

19. Remove the control arm-to-frame bracket bolts, nuts and washers.

20. Remove the lower control arm and torsion bar as a unit.

21. Separate the control arm and torsion bar.

22. On 15 and 25 Series, the bushings are not replaceable. If they are damaged, the control arm will have to be replaced. On 35 Series, proceed as follows:

a. **FRONT BUSHING:** Unbend the crimps with a punch. Force out

the bushings with tools J-36618-2, J-9519-23, J-36618-4 and 36618-1.

b. **REAR BUSHING:** Force out the bushings with tools J-36618-5, J-9519-23, J-36618-3 and J-36618-2. There are no crimps.

To install:

23. On 35 Series, install a new front bushings, then a new rear bushing using the removal tools.

24. Assemble the control arm and torsion bar.

25. Raise the control arm assembly into position. Insert the front leg of the control arm into the crossmember first, then the rear leg into the frame bracket.

26. Install the bolts, front one first. The bolts must be installed with the front bolt head heads towards the front of the vehicle and the rear bolt head towards the rear of the vehicle!

NOTE: Do not torque the bolts yet. The bolts must be torque with the vehicle at its proper ride height.

27. Start the ball joint into the knuckle. Make sure it is squarely seated. Tighten the nut to 96 ft. lbs. and install a new cotter pin. Always advance the nut to align the cotter pin hole. Never back it off.

28. Install the adjuster arm.

29. Using tool J-36202, increase tension on both torsion bars.

30. Install the adjustment retainer plate and bolt on both torsion bars.

31. Set the adjustment bolt to the marked position.

32. Release the tension on the torsion bar until the load is taken up by the adjustment bolt.

33. Remove the tool.

34. Position the shaft in the hub and install the washer and hub nut. Leave the drift in the rotor vanes and tighten the hub nut to 175 ft. lbs.

35. Install the flange bolts. Tighten them to 59 ft. lbs. Remove the drift.

36. Connect the inner tie rod end at the steering relay rod. Torque the nut to 35 ft. lbs.

37. Install the splash shield.

38. Connect the stabilizer bar to the lower control arm. Torque the nuts to 13 ft. lbs.

39. Install the shock absorber.

40. Install the wheel.

41. Lower the vehicle. Once the weight of the vehicle is on the wheels:

a. Lift the front bumper about 38mm and let it drop.

b. Repeat this procedure 2 or 3 more times.

c. Draw a line on the side of the lower control arm from the centerline of the control arm pivot shaft, dead level to the outer end of the control arm.

d. Measure the distance between the lowest corner of the steering knuckle and the line on the control arm. Record the figure.

e. Push down about 38mm on the front bumper and let it return. Repeat the procedure 2 or 3 more times.

f. Re-measure the distance at the control arm.

g. Determine the average of the 2 measurements. The average distance should be $73.6\text{mm} \pm 6\text{mm}$.

h. If the figure is correct, tighten the control arm nuts to 135 ft. lbs.

i. If the figure is not correct, tighten the pivot bolts to 135 ft. lbs. and have the front end alignment corrected.

Steering Knuckle

REMOVAL & INSTALLATION

1986 C Series, 1987-90 R Series and Van

1. Raise and support the vehicle safely.

2. Remove the wheels.

3. Dismount the caliper and suspend it out of the way without disconnecting the brake lines.

4. Remove the hub/rotor assembly.

5. Unbolt the splash shield and discard the old gasket.

6. Using a ball joint separator, disconnect the tie rod end from the knuckle.

7. Position a floor jack under the lower control arm, near the spring seat. Raise the jack until it just takes up the weight of the suspension, compressing the spring. Safety-chain the coil spring to the lower arm.

8. Remove the upper and lower ball joint nuts.

9. Using tool J-23742, or equivalent, break loose the upper ball joint from the knuckle.

10. Raise the upper control arm just enough to disconnect the ball joint.

11. Using the afore-mentioned tool, break loose the lower ball joint.

12. Lift the knuckle off of the lower ball joint.

13. Inspect and clean the ball stud bores in the knuckle. Make sure that there are no cracks or burrs. If the knuckle is damaged in any way, replace it.

14. Check the spindle for wear, heat discoloration or damage. If at all damaged, replace it.

To install:

15. Maneuver the knuckle onto both ball joints.

16. Install both nuts. On 10/1500 series and 20/2500 series, torque the upper nut to 50 ft. lbs. and the lower nut

to 90 ft. lbs. On 30/3500 series, torque both nuts to 90 ft. lbs.

17. Install the cotter pins. Always advance the nut to align the cotter pin hole. Never back it off. On the upper nut which was originally torque to 50 ft. lbs., don't exceed 90 ft. lbs. when aligning the hole. On nuts torqued originally to 90 ft. lbs., don't exceed 130 ft. lbs. to align the hole.

18. Remove the floor jack.

19. Install a new gasket and the splash shield. Torque the bolts to 10 ft. lbs.

20. Connect the tie rod end.

21. Install the hub/rotor assembly.

22. Install the caliper.

23. Adjust the wheel bearings.

24. Install the wheels.

25. Check the alignment.

1986 K Series, 1987-90 V Series

10/1500 AND 20/2500 SERIES

1. Raise and support the vehicle safely.

2. Remove the wheels.

3. Remove the locking hubs.

4. Remove the spindle.

5. Disconnect the tie rod end from the knuckle.

6. Remove the knuckle-to-steering arm nuts and adapters.

7. Remove the steering arm from the knuckle.

8. Remove the cotter pins and nuts from the upper and lower ball joints.

NOTE: Do not remove the adjusting ring from the knuckle. If it is necessary to loosen the ring to remove the knuckle, don't loosen it more than 2 threads. The non-hardened threads in the yoke can be easily damaged by the hardened threads in the adjusting ring if caution is not used during knuckle removal!

9. Insert the wedge-shaped end of the heavy prybar, or wedge-type ball joint tool, between the lower ball joint and the yoke. Drive the prybar in to break the knuckle free.

10. Repeat the procedure at the upper ball joint.

11. Lift off the knuckle.

To install:

12. Position the knuckle on the yoke.

13. Start the ball joints into their sockets. Place the nuts onto the ball studs. The nut with the cotter pin slot is the upper nut. Tighten the lower nut to 30 ft. lbs., for now.

14. Using tool J-23447, tighten the adjusting ring to 50 ft. lbs.

15. Tighten the upper nut to 100 ft. lbs. Install a new cotter pin. Never loosen the nut to align the cotter pin hole; always tighten it.

16. Tighten the lower nut to 70 ft. lbs.

17. Attach the steering arm to the knuckle using adapters and new nuts. Torque the nuts to 90 ft. lbs.

18. Connect the tie rod end to the knuckle.

19. Install the spindle.

20. Install the hub/rotor assembly and wheel bearings. Adjust the bearings.

21. Install the locking hubs.

22. Install the wheel.

30/3500 SERIES

1. Raise and support the vehicle safely.

2. Remove the wheel.

3. Remove the hub/rotor/bearings assembly.

4. Remove the locking hubs.

5. Remove the spindle. See the procedure above.

6. Remove the upper cap from the right side knuckle and/or steering arm from the left side knuckle, by loosening the bolts (right side) and/or nuts (left side) a little at a time in an alternating pattern. This will safely relieve spring pressure under the cap and/or arm. Once spring pressure is relieved, remove the bolts and/or nuts, washers and cap and/or steering arm.

7. Remove the gasket and compression spring.

8. Remove the bolts and washers and remove the lower bearing cap and the lower kingpin.

9. Remove the upper kingpin bushing by pulling it out through the knuckle.

10. Remove the knuckle from the axle yoke.

11. Remove the retainer from the knuckle.

12. Using a large breaker bar and adapter J-26871, remove the upper kingpin from the axle yoke by applying 500-600 ft. lbs. of torque to the kingpin to break it free.

13. Using a hammer and blunt drift, drive out the retainer, race bearing and seal from the axle yoke. These are driven out all at once.

To install:

14. Using tool J-7817, install a new retainer and race in the axle yoke.

15. Fill the recessed area in the retainer and race with the same grease used on the wheel bearings.

16. Completely pack the upper yoke roller bearing with wheel bearing grease. A cone-type bearing packer is preferable, but the bearing may be packed by hand. See the Wheel Bearing PACKING procedure.

17. Install the bearing and a new seal in the upper axle yoke, using a bearing driver such as J-22301. Don't distort

the seal. It should protrude slightly above the yoke when fully seated.

18. Using adapter tool J-28871, install the upper kingpin. The kingpin must be torque to 550 ft. lbs.

19. Position the knuckle in the yoke. Working through the knuckle, install a new felt seal over the kingpin and position the knuckle on the kingpin.

20. Install the bushing over the kingpin.

21. Install the compression spring, gasket, bearing cap and/or steering arm and bolts and/or nut and washer. Torque the bolts and/or nuts, in an alternating pattern, to 80 ft. lbs.

22. Install the lower bearing cap and kingpin. Torque the bolts to 80 ft. lbs. in an alternating pattern.

23. Thoroughly lube both king pins through the grease fittings.

24. Install the spindle.

25. Install the hub/rotor/bearing assembly. Adjust the bearings.

27. Install the locking hubs.

28. Install the wheel.

29. Check the front end alignment.

1988-90 C Series

1. Raise and support the vehicle safely. Let the control arms hang freely.

2. Remove the wheels.

3. Disconnect the tie rod end from the knuckle.

4. Dismount the caliper and suspend it out of the way without disconnecting the brake lines.

5. Remove the hub/rotor assembly.

6. Unbolt the splash shield from the knuckle and discard the old gasket.

7. If a new knuckle is being installed, remove the knuckle seal carefully, without damaging it.

8. Position a floor jack under the lower control arm, near the spring seat. Raise the jack until it *just* takes up the weight of the suspension, compressing the spring. Safety-chain the coil spring to the lower arm.

9. Remove the upper and lower ball joint nuts.

10. Using tool J-23742, or equivalent, break loose the upper ball joint from the knuckle.

11. Raise the upper control arm just enough to disconnect the ball joint.

12. Using the afore-mentioned tool, break loose the lower ball joint.

13. Lift the knuckle off of the lower ball joint.

14. Inspect and clean the ball stud bores in the knuckle. Make sure that there are no cracks or burrs. If the knuckle is damaged in any way, replace it.

15. Check the spindle for wear, heat discoloration or damage. If at all damaged, replace it.

Front suspension assembly—1986 C Series and 1987-90 R Series

5 GENERAL MOTORS FULL SIZE • BLAZER/JIMMY • PICK-UP

To install:

16. Maneuver the knuckle onto both ball joints.

17. Install both nuts. Torque the nuts to 90 ft. lbs.

18. Install new cotter pins. Always advance the nut to align the cotter pin hole. Never back it off.

19. Install the knuckle seal.

20. Remove the floor jack.

21. Install a new gasket and the splash shield. Torque the bolts to 12 ft. lbs.

22. Connect the tie rod end.

23. Install the hub/rotor assembly.

24. Install the caliper.

25. Adjust the wheel bearings.

26. Install the wheels.

27. Have the alignment checked.

1988-90 K Series

1. Disconnect the negative battery cable.

2. Remove $\frac{2}{3}$ of the brake fluid from the reservoir.

3. Raise and support the vehicle safely.

4. Remove the wheel, caliper and brake disc.

5. Remove the drive axle nut and washer.

6. Remove the tie rod nut and remove the tie rod end from the end of the washer.

7. Remove the hub and bearing assembly, using a puller.

8. Remove the drive axle.

9. Remove the splash shield.

10. Remove the splash shield bolts and splash shield.

11. Support the lower control arm, using suitable equipment.

12. Remove the upper ball joint nut and remove the upper ball joint.

13. Remove the knuckle and the knuckle seal, as required.

To install:

14. Install the seal into the knuckle, using tool J-36605, or equivalent.

15. Install the knuckle to the upper and lower ball joints and tighten the

nuts to 94 ft. lbs. Tighten the nuts to align the new cotter pin, but do not tighten more than $\frac{1}{6}$ turn. Bend the pin ends against the nut flats.

17. Install the splash shield and tighten the bolts to 12 ft. lbs.

18. Install the drive axle.

19. Install the hub and bearing assembly. Align the threaded holes and tighten the bolts to 66 ft. lbs.

20. Install the tie rod end to the knuckle, and tighten the tie rod nut to 35 ft. lbs.

21. Install the washer and axle nut and torque to 173 ft. lbs.

22. Install the brake disc and caliper.

23. Install the axle joint cover.

24. Install the wheel and torque the wheel nuts to 90 ft. lbs for all except the K300 with dual wheels. For the K300 with dual wheels, torque to 120 ft. lbs.

25. Lower the vehicle and check the front end alignment.

Stabilizer Bar

REMOVAL & INSTALLATION

1986 C Series, 1987-90 R Series and Van

1. Raise and support the vehicle safely. As required, remove the tire and wheel assemblies.

2. Properly support the stabilizer bar assembly. Remove the stabilizer shaft bushing retaining bolts. Remove the stabilizer link bushing nuts and bolts.

3. Remove the stabilizer bar from the vehicle.

4. Installation is the reverse of removal. Note, the split in the bushing faces forward. Coat the bushings with silicone grease prior to installation. Install all fasteners finger-tight. When all the fasteners are in place torque all of them to 24 ft. lbs.

1986 K Series and 1987-90 V Series

1. Raise and support the vehicle safely.

2. Remove the wheels.

3. Remove the stabilizer bar-to-frame clamps.

4. Remove the stabilizer bar-to-spring plate bolts.

5. Remove the stabilizer bar and bushings.

6. Check the bushings for wear or splitting. Replace any damaged bushings.

7. Installation is the reverse of removal. Note, the split in the bushing faces forward. Coat the bushings with silicone grease prior to installation. Install all fasteners finger-tight. When all the fasteners are in place torque the

stabilizer bar-to-frame nuts to 52 ft. lbs. Torque the stabilizer bar-to-spring plate bolts to 133 ft. lbs.

1988-90 C Series

NOTE: The end link bushings, bolts and spacers are not interchangeable from left to right, so keep them separate.

1. Raise and support the vehicle safely.

2. Remove the nuts from the end link bolts.

3. Remove the bolts, bushings and spacers.

4. Remove the bracket bolts and remove the stabilizer bar.

5. Inspect the bushings for wear or damage. Replace them as necessary.

6. Installation is the reverse of removal. Coat the bushings with silicone grease prior to assembly. The slit in the bushings faces the front of the vehicle. Torque the frame bracket bolts to 24 ft. lbs.; the end link nuts to 13 ft. lbs.

1988-90 K Series

NOTE: The end link bushings, bolts and spacers are not interchangeable from left to right, so keep them separate.

1. Raise and support the vehicle safely.

2. Remove the nuts, bolts, spacer and clamp from the ends.

3. Remove the stabilizer bar and remove the insulator.

4. Inspect all parts for wear or damage and replace them as necessary.

5. Installation is the reverse of removal.

6. Unload the torsion bar using tool J-36202, as noted in torsion bar removal.

King Pins

REMOVAL & INSTALLATION

V30/3500 and K30/3500 Series

1. Remove the hub and spindle as previously outlined. Check the bronze spacer between the axle shaft joint assembly and bearing, if worn it must be replaced.

2. Remove the upper king pin cap nuts alternately, as the spring pressure will be forcing the cap up.

3. Remove the cap, compression spring, and gasket. Discard the gasket.

4. Remove the four cap screws from the lower king pin bearing cap. Remove the gearing cap and king pin.

5. Remove the upper king pin tapered bushing and knuckle from the yoke. Remove the felt seal and remove the knuckle.

6. Remove the upper king pin from the yoke with a large breaker bar.

7. Remove the lower king pin bearing cup, cone, grease retainer, and seal. Discard the seal. If the grease retainer is damaged, replace it.

To install:

8. Install the new grease retainer and lower king pin bearing cup using special tool J-7817 or its equivalent.

9. Fill the grease retainer, grease the bearing and install. Install the lower seal using tool J22301 or its equivalent.

NOTE: Do not distort the oil seal. It will protrude slightly from the surface of the yoke when installed.

10. Install the upper king pin using tool J18871 or its equal. Torque to 500-600 ft. lbs.

11. Install the felt seal on the king pin.

12. Install the knuckle and tapered bushing over the king pin.

Lower control arm Installation—1988-90 K Series

13. Install the lower bearing cap and king pin. Torque the cap screws to 80 ft. lbs.

14. Place the compression spring on the upper king pin bushing. Install the bearing cap with a new gasket. Torque the nuts to 80 ft. lbs.

Front Wheel Bearings

NOTE: For 4WD vehicles, refer to Drive Axle removal and installation procedures.

REMOVAL & INSTALLATION

2WD

1. Raise and support the vehicle safely. Remove the tire and wheel assembly.

2. Remove the brake caliper and position it to the side. Remove the dust cover, cotter pin, washer and spindle nut.

3. Remove the outer wheel bearing assembly. Remove the brake rotor. Re-

move the inner wheel bearing assembly.

4. Installation is the reverse of the removal procedure. When installing new bearings be sure to install new bearing races inside the rotor, using the proper removal and installation tools.

5. Pack new bearings, with the proper grade and type wheel bearing grease. Adjust wheel bearings, as required.

Hub and bearing assembly—except 1988-90 C/K Series

ADJUSTMENT

2WD

1. Raise and support the vehicle safely. Remove the dust cap and cotter pin.

2. Tighten the spindle nut to 12 ft. lbs. while turning the tire and wheel assembly. Back off the nut to the just loose position.

3. Hand tighten the spindle nut. Loosen the nut until the cotter pin can be installed in the spindle slot.

4. End play should be 0.001-0.005 inches (except 1988-90 C/K Series) and 0.001-0.008 inches (1988-90 C/K Series).

REAR SUSPENSION

Shock Absorbers

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely. Properly support the rear axle assembly. Remove the lower shock absorber bolt.

3. Remove the shock absorber from the vehicle.

4. Installation is the reverse of the removal procedure.

Leaf Spring

REMOVAL & INSTALLATION

1986 C/K Series, 1987-90 R/V Series and Van

1. Raise and support the vehicle safely. Properly support the rear axle assembly to relieve tension on the springs.

2. If equipped, remove the stabilizer bar. Loosen, but do not remove the spring to shackle nut and bolt.

3. Remove the nut and bolt securing the shackle to the rear hanger. Remove the nut and bolt securing the leaf spring to the front hanger.

4. Remove the leaf spring from the front hanger. Remove the nut and bolt securing the shackle to the leaf spring. Remove the shackle.

5. Remove the nuts and washers holding the spring to the frame. If equipped, remove the rear stabilizer anchor plate, spacers, shims and auxiliary spring.

6. Remove the U bolts from the assembly. Remove the leaf spring from the vehicle.

7. Installation is the reverse of the removal procedure.

1988-90 C/K Series

1. Raise and support the vehicle safely. Properly support the rear axle assembly to relieve tension on the springs.

Rear suspension assembly — 1986-90 G30/3500 Series cutaway van

2. Remove the shock absorber. Remove the U bolt nuts, washers, anchor plate and U bolt.

3. Remove the shackle to frame bolt, washers and nut. Remove the spring assembly to front bracket nut, washers and bolt.

4. Remove the spring assembly from the vehicle. As required, separate the spring from the shackle.

5. Installation is the reverse of the removal procedure.

6. Tighten the U-bolt nuts in a diagonal sequence to 15 ft. lbs., then to 81 ft lbs. for all except the 7.4L engine with dual rear wheels. With the 7.4L engine with dual rear wheels tighten to 109 ft. lbs. The spring height must be adjusted to obtain a measurement of 7.17 in. between the top surface of the axle jounce pad and the bottom surface of the frame jounce pad.

U-bolt tightening sequence — except 1988-90 C/K Series

Rear leaf spring and components—1988–90 C/K Series

VEHICLE IDENTIFICATION CHART

It is important for servicing and ordering parts to be certain of the vehicle and engine identification. The VIN (vehicle identification number) is a 17 digit number visible through the windshield on the driver's side of the dash and contains the vehicle and engine identification codes. The tenth digit indicates model year and the eighth digit indicates engine code. It can be interpreted as follows:

Engine Code					
Code	Cu. In.	Liters	Cyl.	Fuel Sys.	Eng. Mfg.
E	151	2.5	4	EFI	Pontiac
R	173	2.8	6	EFI	Chevrolet
D	189	3.1	6	EFI	Chevrolet
Z	262	4.3	6	EFI	Chevrolet

Model Year	
Code	Year
G	1986
H	1987
J	1988
K	1989
L	1990

① Inner bolts: 36 ft. lbs.

Outer bolts: 32 ft. lbs.

② Center Bolts: 26 ft. lbs.

Outer bolts: 20 ft. lbs.

③ Tighten in 3 stages:

1st to 18 ft. lbs.

2nd to 26 ft. lbs. (except studs—tighten to 18 ft. lbs.)

3rd an additional 90 degrees (1/4 turn)

④ With manual transmission 65 ft. lbs.

⑤ Tighten in 2 stages:

1st to 40 ft. lbs.

2nd an additional 90 degrees (1/4 turn)

ENGINE ELECTRICAL

Distributor

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove all necessary compo-

nents in order to gain access to the distributor assembly.

3. Disconnect the distributor electrical connectors. Mark and remove the spark plug wires.

4. Remove the distributor cap. Position the engine at TDC. Matchmark the rotor and the distributor body. Matchmark the distributor assembly and the engine block.

5. Remove the distributor retaining bolt. Carefully remove the distributor from the vehicle.

NOTE: As the distributor is removed from the engine, the rotor will turn counterclockwise. Observe and mark the start and finish rotation of the rotor. When re-installing, position the rotor at the last mark and set the distributor into the engine. As the distributor drops into place, the rotor should turn to its original position, providing the engine crankshaft had not been rotated with the distributor out.

6. Installation is the reverse of the removal procedure.

Ignition Timing

ADJUSTMENT

1. Locate and clean off the timing marks.
2. Use chalk or white paint to color the mark on the scale that will indicate the correct timing, when aligned with the mark on the pulley or the pointer.
3. Attach a tachometer to the engine. Attach a timing light to the engine.
4. On some engines, it is necessary to disconnect the EST connector to set the timing. See the underhood sticker.
5. Adjust the idle to the correct specification.
6. Loosen the distributor lock bolt just enough so that the distributor can be turned with a little resistance.
7. With the timing light aimed at the pulley and the marks on the engine, turn the distributor in the direction of rotor rotation to retard the spark, and in the opposite direction of rotor rotation to advance the spark. Align the marks on the pulley and the engine with the flashes of the timing light.

Alternator

For further information on the charging system, please refer to "Charging and Starting" in the Unit Repair section.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Disconnect the electrical connectors at the alternator.
2. Remove the necessary components in order to gain access to the alternator assembly. On Astro and Safari, remove the upper radiator fan shroud.
3. Remove the alternator belt. On models so equipped relieve the tension on the serpentine drive belt and remove the serpentine drive belt.
4. Remove the alternator retaining bolts and remove the alternator from the vehicle.
5. Installation is the reverse of the removal procedure. Adjust the alternator belt, as required.

BELT TENSION ADJUSTMENT

Standard Belt

1. Run the engine at idle for a minimum of 15 minutes. This allows the belt to reseal itself in the pulleys.

Alternator mounting—2.5L engine

Alternator mounting—2.8L engine

Alternator mounting—3.1L engine

Serpentine Drive Belt

The serpentine belt grooves must match the grooves in the pulleys. The tensioner is spring loaded. After removing the belt the tensioner will return the tension position.

1. Insert a 1/2 in. breaker bar into the tensioner pulley.
2. Rotate the tensioner to the left (counterclockwise) and remove the belt.
3. Route the new belt over all the pulleys except the water pump.
4. Insert a 1/2 in. breaker bar into the tensioner pulley.
5. Rotate the tensioner pulley to the left (counterclockwise).
6. Install the belt over the water pump pulley.
7. Check the belt for correct V groove tracking.

2. Allow the drive belt to cool, warm to the touch but not hot.
3. Place a belt tension gauge at the center of the greatest belt span. The tension should be between 67-90 ft. lbs. (300-400 Nm).

Alternator mounting—4.3L engine

Starter

For further information on the charging system, please refer to "Charging and Starting" in the Unit Repair section.

REMOVAL & INSTALLATION

Pick-Up, Blazer and Jimmy

2WD VEHICLE

1. Disconnect the negative battery cable.
2. Raise and support the vehicle safely.
3. Disconnect the solenoid wiring.
4. On the 2.5L engine, disconnect the brush end mounting bracket and wiring.
5. Remove the 2 bolts and washers and remove the starter and the shim.
6. Installation is the reverse of removal. Install the shim and torque the mounting bolts to 31 ft. lbs. (2.5L engine), 30 ft. lbs. (2.8L and 4.3L engines).

4WD VEHICLE

1. Disconnect the negative battery cable.
2. Raise and support the vehicle safely.
3. Disconnect the solenoid wiring.
4. On the 2.5L engine, disconnect the brush end mounting bracket and wiring.
5. Remove the 4 bolts on the skid plate, if so equipped and remove the skid plate.
6. Remove the bolts and 2 brackets holding the brake line to the crossmember.
7. Remove the 3 bolts on each side and remove the crossmember.

8. Remove the bracket holding the transmission cooler lines to the flywheel housing, brace rod to the flywheel housing, and the flywheel housing as necessary.

9. Remove the 2 bolts and washers and remove the starter and the shim.
6. Installation is the reverse of removal. Install the shim and torque the mounting bolts to 31 ft. lbs. (2.5L engine), 30 ft. lbs. (2.8L and 4.3L engines).

Astro and Safari

1. Disconnect the negative battery cable.
2. Raise and support the vehicle safely.
3. Disconnect the solenoid wiring.
4. Remove the 2 bolts and washers and remove the starter and the shim.
5. Installation is the reverse of removal. Install the shim (if used) and torque the mounting bolts to 31–32 ft. lbs. (2.5L engine), 28 ft. lbs. (1986–87 4.3L engine) and 35 ft. lbs. (1988–90 4.3L engine).

Lumina APV, Silhouette and Trans Sport

1. Disconnect the negative battery cable.
2. As necessary, raise and support the vehicle safely.
3. Disconnect the oil pressure sensor electrical connector.
4. Disconnect the oil pressure sensor.
5. Disconnect the solenoid wiring.
6. Remove the 2 bolts and washers and remove the starter and the shim.
7. Installation is the reverse of removal. Install the shim, if used and torque the mounting bolts to 32 ft. lbs.

CHASSIS ELECTRICAL

Heater Blower Motor

REMOVAL & INSTALLATION

Pick-Up, Blazer and Jimmy

1. Disconnect the battery ground cable.
2. Disconnect the blower motor electrical connections.
3. Remove the blower motor attaching screws.
4. Remove the blower motor from the vehicle.
5. Installation is the reverse of the removal procedure.

Astro and Safari

1. Disconnect the negative battery cable.
2. Remove the engine coolant bottle. Remove the 2 bolts from the windshield washer bottle and position the assembly out of the way.
3. Disconnect the electrical connections from the heater blower assembly. Remove the blower motor relay bracket, as required.
4. Remove the blower motor retaining screws. Remove the heater motor from the vehicle.
5. Installation is the reverse of the removal procedure. Transfer the blower motor cage, as required. Upon installation align the motor assembly with the alignment pin.

Lumina APV, Silhouette and Trans Sport

1. Disconnect the negative battery cable.
2. Remove the engine air cleaner.
3. Disconnect the left windshield wiper transmission arm linkage.
4. Disconnect the blower motor electrical harness.
5. Remove the blower motor retaining screws and remove the blower motor assembly.
6. Installation is the reverse of removal.

Windshield Wiper Motor

REMOVAL & INSTALLATION

Pick-Up, Blazer and Jimmy

1. Disconnect the negative battery cable.
2. Remove the windshield wiper arms.
3. Remove the cowl screen, as required.
4. Mark the position of the wiper motor arm. Remove the wiper motor arm nut and remove the arm.
5. Disconnect the electrical wiring from the motor assembly.
6. Remove the motor retaining screws. Remove the windshield wiper motor while guiding it through the hole.
7. Installation is the reverse of the removal procedure. Install the arm in alignment with the previously made mark.

Astro and Safari

1. Disconnect the negative battery cable.
2. Disconnect the transmission link from the crank arm on the motor by pulling or prying it toward the rear of the vehicle.
3. Remove the wiper arm bolts and remove the wiper arm.
4. Remove the motor mounting bolts and remove the motor.
5. Installation is the reverse of removal.

Lumina APV, Silhouette and Trans Sport

1. Run the wipers to the park position.
2. Disconnect the negative battery cable.
3. Disconnect the washer hoses.
4. Remove the nut from each wiper arm.
5. Lift each wiper arm and insert a suitable pin completely through the 2 holes located next to the pivot of the

arm, then using tool J-22888 or equivalent, remove the arms from the drive shafts.

6. Remove the air cleaner.
7. Disconnect the wiring harness from the wiper motor.
8. Using a Torx® bit, remove the 2 wiper housing bolts.
9. Remove the 3 mounting nuts and washers and remove the module from the vehicle.
10. Loosen the 2 crank arm socket screw and lockwashers until the socket releases from the crank arm ball.

NOTE: Do not remove the crank arm from the motor.

11. Remove the 3 wiper motor retaining screws and remove the wiper motor from the frame.
11. Make sure the wiper motor is in the park position and reverse the removal procedure.

Windshield Wiper Switch

REMOVAL & INSTALLATION

Pick-Up, Blazer, Jimmy, Astro, Safari and Lumina APV

The wiper switch on these vehicles is part of the multifunction switch on the column.

1. Disconnect the negative battery cable.
2. Remove the wiring protector cover underneath the column.
3. Disconnect the multi-function switch.
4. Disconnect the cruise control wire.
5. Remove the switch.
6. Installation is the reverse of re-

moval. Feed the cruise control wire into the column using piano wire or something similar.

Trans Sport and Silhouette

1. Disconnect the negative battery cable.
2. Grip the pod and carefully pull the wiper switch out to release the 2 spring retaining clips.
3. Disconnect the electrical connector and remove the switch.
4. Installation is the reverse of removal.

Instrument Cluster

REMOVAL & INSTALLATION

Pick-Up, Blazer and Jimmy

1. Disconnect the negative battery cable.
2. Remove the lamp switch trim plate screws and remove the trim plate.
3. Disconnect the lamp switch harness.
4. Remove the air conditioner and heater control assembly retaining screws and remove the control assembly.
5. Disconnect the air conditioner and heater control assembly harness.
6. Remove the filler panel screws and remove the filler panel.
7. Remove the instrument cluster housing nuts and remove the instrument cluster housing.
8. Remove the instrument cluster nuts and remove the instrument cluster.
9. Disconnect the speedometer drive cable and the cluster harness.
10. Installation is the reverse of removal.

Instrument cluster assembly—Pick-Up, Blazer and Jimmy

Instrument cluster assembly—Astro and Safari

Instrument cluster assembly—Trans Sport

Astro and Safari

1. Disconnect the negative battery cable.
2. Remove the instrument panel cluster trim plate screws.
3. Remove the instrument panel cluster screws.
4. Disconnect the instrument panel cluster harness connectors.
5. Remove the instrument panel cluster.
6. Installation is the reverse of removal.

Lumina APV and Trans Sport

1. Disconnect the negative battery cable.
2. Remove the 4 screws securing the instrument panel pad to the instrument panel lower trim pad.
3. On Canadian models so equipped, disconnect the daytime running lights sensor attached to the pad under the front left hand speaker grille.
4. Lift the instrument panel trim pad up and pull the pad rearward to disengage the pad from the 4 slots in the lower trim pad and remove the pad assembly.
5. Grip the pod and carefully pull the wiper switch out to release the 2 spring retaining clips.
6. Disconnect the electrical connector and remove the switch.
7. Remove the 2 cluster housing screws attaching the trim to the instrument panel lower trim pad.
8. Feed the instrument panel harness through the switch pod openings in the housing.
9. Lift the housing up while pulling rearward to release the 2 tabs on the pad from the slots in the housing and remove the cluster housing.
10. Remove the 4 bolts securing the cluster to the right and left hand retainers.
11. Disconnect the instrument panel harness connector and remove the cluster.
12. Installation is the reverse of removal.

Silhouette

1. Disconnect the negative battery cable.
2. Open the glove box door to access the 2 screws securing the lower instrument panel trim pad assembly to the instrument panel pad assembly.
3. Remove the 2 screws securing the instrument cluster trim panel to the instrument panel pad.
4. Remove the screw retaining the headlamp switch pod to the cluster trim panel and remove the headlamp switch pod. Disconnect the wiring harness to the pod.

Instrument cluster assembly — Silhouette

5. Remove the screw retaining the windshield wiper switch pod to the cluster trim panel and remove the wiper switch pod. Disconnect the wiring harness to the pod.

6. Remove the 2 screws behind each switch pod securing the cluster trim panel to the left and right instrument cluster mounting brackets.

7. Remove the steering column opening filler.

8. Disconnect the PNDRL cable clip.

9. Disconnect the instrument panel harness connector to the instrument cluster.

10. Remove the 2 screws on each side from the left and right cluster retainer brackets and remove the instruments cluster.

11. Installation is the reverse of removal.

Speedometer

REMOVAL & INSTALLATION

Pick-Up, Blazer and Jimmy

1. Remove the instrument cluster.
2. Remove the cluster case retaining screws.

3. Remove the speedometer to cluster case retaining screws.

4. Remove the cluster panel from the cluster case.

5. Remove the speedometer mounting screws and remove the speedometer.

6. Installation is the reverse of removal.

Astro and Safari

1. Remove the instrument cluster.
2. Remove the speedometer head

retaining screws and remove the speedometer head.

3. Installation is the reverse of removal.

Lumina APV, Silhouette and Trans Sport

On these vehicles the speedometer is part of the instrument cluster.

Radio

REMOVAL & INSTALLATION

Pick-Up, Blazer and Jimmy

1. Disconnect the negative battery cable.

2. Remove the ash tray and any wires needed for clearance.

3. Remove the trim plate.

4. Remove the nuts from the support clips.

5. Remove the support bracket retainer screws.

6. Pull the radio forward and disconnect the antenna cable, clock connector, speaker connectors and remove the radio.

NOTE: Do not let the antenna cable touch the clock connector.

7. Installation is the reverse of removal. Always connect the speaker wiring harness to the radio before applying power to the receiver to prevent damage to the receiver.

Astro and Safari

1. Disconnect the negative battery cable.

2. Remove the instrument panel compartment assembly.

3. Remove the accessory trim plate.

4. Disconnect the radio fasteners from the instrument panel.

5. Pull the radio forward and disconnect the antenna cable and speaker and electrical connectors and remove the radio.

6. Installation is the reverse of removal. Always connect the speaker wiring harness to the radio before applying power to the receiver to prevent damage to the receiver.

Lumina APV, Silhouette and Trans Sport

1. Disconnect the negative battery cable.

2. Remove the steering column opening filler panel.

3. Remove the right hand sound insulator panel.

4. Remove the accessory trim panel.

5. Loosen the 2 nuts at the bottom of the radio.

6. Remove the 2 screws attaching the radio bracket to the instrument panel lower trim pad assembly.

Radio mounting — Pick-Up, Blazer, Jimmy, Astro and Safari

Radio mounting — Lumina APV

7. Slide the radio assembly out from the accessory housing.

8. Disconnect the antennal lead-in cable and the electrical connectors from the radio, then remove the radio.

9. Installation is the reverse of removal.

Turn Signal Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the steering wheel.

3. If necessary, remove the instrument panel trim cover.

4. Insert a suitable tool in the slot in the lock plate cover and remove the cover.

5. Use lock plate compressing tool J-23653-A or equivalent on the steering shaft and compress the lock plate. Pry the retaining ring off of the shaft and remove the lock plate.

NOTE: If the column is being disassembled on a bench, the shaft could slide out of the end of the mast jacket when the snapping is removed.

6. Remove the turn signal lever screw and lever.

7. Press the hazard warning knob inward and then unscrew.

8. Remove the turn signal switch mounting screws. Pull the switch straight up, guiding the wiring harness and cover through the column housing.

Radio mounting — Trans Sport

9. Installation is the reverse of removal.

Ignition Lock Cylinder

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Place the lock cylinder in the RUN position.

3. Remove the steering wheel.

4. Remove the turn signal switch. Pull the switch rearward far enough to slip it over the shaft. Do not pull the harness out of the column.

5. Remove the retaining screw and remove the lock cylinder.

To install:

6. Align the cylinder and key with the keyway in the housing, rotate clockwise and push all the way in.

7. Install the retaining screw.

8. On the Pick-Up, Blazer, Jimmy, Astro and Safari, tighten the screw to 40 inch lbs. (non-tilt columns) and 22 inch lbs. (tilt columns).

9. On the Lumina APV, Silhouette and Trans Sport tighten the screw to 22 inch lbs.

10. Install the turn signal switch and steering wheel.

Ignition and Dimmer Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. If equipped, remove the lower trim panel.

2. Remove the steering column retaining bolts. Lower the steering column assembly to gain access to the switch retaining screws. Extreme care is necessary to prevent damage to the collapsible column.

3. Make sure the switch is in the LOCK position. If the lock cylinder is out, pull the switch rod up to the stop, then go down one detent.

4. Remove the electrical connections from the switches. Remove the switch retaining screws. Remove the switch from the column.

5. Installation is the reverse of the removal procedure. Before installation, make sure the ignition switch is in the LOCK position.

6. To adjust the dimmer switch, depress the switch slightly to allow insertion of a $\frac{3}{32}$ in. drill bit into the hole above the actuator rod. Force the switch upward then tighten the screw.

7. Install the switch using the original screws. Use of screws that are too long could prevent the column from collapsing on impact.

Combination Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the wiring protector cover underneath the column.

3. Disconnect the multi-function switch.

4. Disconnect the cruise control wire.

5. Remove the switch.

6. Installation is the reverse of removal. Feed the cruise control wire into the column using piano wire or something similar.

Stoplight Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Remove the under dash trim panel.

2. Disconnect the switch electrical connections. Remove the switch assembly from its mounting.

3. Installation is the reverse of the removal procedure. Adjust the switch, as required.

ADJUSTMENT

1. Depress the brake pedal and press the switch in until it is firmly seated in its mounting.
2. Pull the brake pedal against the pedal stop until the switch does not make any noise.
3. Electrical contact should be made when the brake pedal is depressed from its fully released position.

Clutch Start Switch

REMOVAL & INSTALLATION

Pick-Up, Blazer, Jimmy, Astro and Safari

1. Disconnect the negative battery cable. Remove the under dash hush panel.
2. Disconnect the switch electrical connections.
3. Remove the switch retaining screw and remove the switch from the clutch pedal.

To install:

4. Move the slider to the rear of the shaft.
5. Push the clutch pedal to the floor.
6. Move the slider down the shaft.
7. Release the clutch pedal.
8. Install the electrical connector.
9. Install the hush panel.
10. Reconnect the battery.

Fuses and Circuit Breakers

LOCATION

Pick-Up, Blazer, Jimmy, Astro and Safari

The fuse block is located at the far left side of the instrument panel.

The convenience center is located at the far left side of the instrument panel. The hazard flasher, horn relay and alarm module or buzzers are mounted on the convenience center.

Lumina APV, Silhouette and Trans Sport

The fuse panel is inside the glove compartment.

The convenience center is mounted to a bracket behind the glove compartment. It can be reached by removing the right sound insulator panel. It contains the hazard warning flasher, horn relay and circuit breakers, which can be removed by pulling straight out. It also contains the chime module and A/C low fan relay. To remove the chime module first release the locking tab.

ENGINE COOLING

Radiator

REMOVAL & INSTALLATION

Pick-Up, Blazer, Jimmy, Astro and Safari

1. Disconnect the negative battery cable.
2. Drain the coolant from the radiator.
3. Remove the overflow hose.
4. Remove the upper fan shroud.
5. Disconnect the hoses.
6. Disconnect and plug the transmission fluid cooler lines, if equipped.
7. Disconnect and plug the engine oil cooler lines, if equipped.
8. Remove the radiator retaining bolts and remove the radiator.
9. Installation is the reverse of the removal procedure.

Lumina APV, Silhouette and Trans Sport

1. Disconnect the negative battery cable.
2. Drain the coolant from the radiator.
3. Disconnect the engine forward strut bracket at the radiator, loosen the bolt at the other end and swing the strut rearward.
4. Disconnect the forward lamp harness from the fan frame and unplug the fan connector.
5. Remove the fan attaching bolts and remove the fan and frame assembly.
6. Scribe the latch location then remove the hood latch from the radiator support.
7. Disconnect the coolant hoses from the radiator and the coolant recovery tank hose from the radiator neck.
8. Disconnect and plug the transaxle oil cooler lines.
9. Remove the radiator to support attaching bolts and clamps and remove the radiator from the vehicle.
10. Installation is the reverse of removal.

Electric Cooling Fan

REMOVAL & INSTALLATION

Lumina APV, Silhouette and Trans Sport

1. Disconnect the negative battery cable.

2. Disconnect the engine forward strut bracket from the radiator frame and swing it rearward.

3. Disconnect the forward lamp harness from the fan frame.

4. Remove the fan attaching bolts.

5. Disconnect the fan wiring.

6. Remove the fan and frame assembly from the vehicle.

7. Installation is the reverse of the removal procedure.

Heater Core

REMOVAL & INSTALLATION

Pick-Up, Blazer and Jimmy

1. Disconnect the negative battery cable.
2. Drain the cooling system.
3. Remove and plug the heater hoses at the heater core.
4. Remove the heater core cover attaching screws and remove the cover.
5. Remove the screw retainers at the end of the heater core.
6. Remove the core from under the dash assembly.
7. Installation is the reverse of the removal procedure.

Astro and Safari

1. Disconnect the negative battery cable. Drain the engine coolant.
2. Remove the engine coolant bottle. Remove the bolts from the windshield washer bottle and position it to the side. Remove and plug the heater hoses at the heater core.
3. Remove the instrument panel lower right filler panel. Remove the air distributor duct. Remove the engine cover as needed.
4. Remove the air duct. Remove vacuum lines and control cables as required.
5. Remove the heater core assembly retaining screws. Remove the heater core assembly from the vehicle.
6. Remove the heater core cover plate. Remove the heater core.
7. Installation is the reverse of the removal procedure.

Lumina APV, Silhouette and Trans Sport

1. Disconnect the negative battery cable.
2. Drain the cooling system.
3. Disconnect the heater hoses.
4. Remove the right side sound insulator from under the instrument panel.
5. Remove the glove box.
6. Disconnect the vacuum hoses and wiring from in front of the heater core cover.
7. Remove the heater core cover and remove the heater core.

8. Installation is the reverse of the removal procedure.

Water Pump

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Drain the coolant. Remove the fan shroud, as necessary. Remove the drive belts. Remove the fan and pulley assembly.

2. Remove the necessary components in order to gain access to the water pump retaining bolts.

3. Remove the water pump retaining bolts. Remove the water pump assembly from the engine.

4. Installation is the reverse of the removal procedure. Use a new gasket as required.

5. Before installation clean the mounting surface on water pump and engine block.

6. Torque the mounting bolts on the Lumina APV, Silhouette and Transport to 89 inch lbs. and on the Pick-Up, Blazer, Jimmy, Astro and Safari to 22 ft. lbs.

Thermostat

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Drain the engine coolant.

3. Disconnect the upper radiator hose from the thermostat outlet.

4. Remove the thermostat housing bolts and remove the housing.

5. Remove the thermostat from the housing.

2.8 L ENGINE

2.5 L ENGINE

Water pump assembly mounting –
2.5L and 2.8L engines

6. Installation is the reverse of the removal procedure. Torque the housing bolts to 18 ft. lbs.

7. Bleed the cooling system.

COOLING SYSTEM BLEEDING

1. To bleed the system, start with the system cool, the radiator cap off and the radiator filled to about an inch below the filler neck.

2. Start the engine and run it at slightly above normal idle speed. If air bubbles appear and the coolant level drops, fill the system with an anti-freeze/water mixture to bring the level back to the proper level.

3. Run the engine this way until the thermostat opens, coolant will move abruptly across the top of the radiator and the temperature of the radiator will suddenly rise.

4. At this point, air is often expelled and the level may drop quite a bit. Keep refilling the system until the level is near the top of the radiator and remains constant.

5. Fill the radiator right up to the filler neck. Replace the radiator filler cap.

FUEL SYSTEM

Fuel System Service Precaution

RELIEVING FUEL SYSTEM PRESSURE

The fuel injection system used with the 2.8L, 3.1L and 4.3L engines has a built in bleed feature and requires no pressure relief before servicing. The fuel injection system used with the 2.5L engine does require pressure relief before servicing system components.

2.5L Engine

1. Place the transmission selector in the P position (neutral on vehicles with a manual transmission).

2. Set the parking brake and block the drive wheels.

3. Loosen the fuel filler cap. Raise and safely support the vehicle. Disconnect the electrical connector at the fuel tank.

4. Start the engine and allow it to run for a few seconds until it stalls.

5. Engage the starter a few times to bleed off any remaining pressure.

6. Disconnect the negative battery cable.

7. Service the system as required. When servicing is complete, reconnect the electrical connector at the fuel tank.

Fuel Filter

REMOVAL & INSTALLATION

2.5L Engine

The fuel filter is located on the drivers side of the engine.

1. Relieve the fuel system pressure.

2. Disconnect the negative battery cable.

3. Remove the fuel line connections from the filter.

1. Fuel return pipe
2. Clamp
3. Fuel return hose
4. In-line fuel filter
5. Clamp
6. Fuel feed hose
7. O-ring
8. Tighten nut to 20 ft. lbs. (26 Nm)

Fuel filter removal and installation –
2.8L engine

1. Fuel feed pipe
2. In-line fuel filter
3. Left frame side member
4. Front fuel feed pipe

Fuel filter removal and installation –
4.3L engine

4. Remove the filter mounting clamp bolt and remove the filter.

5. Installation is the reverse of the removal procedure. Tighten the fuel line couplings to 20 ft. lbs.

2.8L and 3.1L Engines

The fuel filter is located on the front drivers side of the engine.

1. Disconnect the negative battery cable.

2. Remove the fuel line connections from the filter.

3. Remove the filter mounting clamp bolt and remove the filter.

4. Installation is the reverse of the removal procedure. Tighten the fuel line couplings to 20 ft. lbs.

4.3L Engine

The fuel filter is located along the right rear frame rail of the vehicle.

1. Disconnect the negative battery cable.

2. Raise and safely support the vehicle.

3. Remove the fuel line connections from the filter.

4. Remove the filter mounting clamp bolt and remove the filter.

5. Installation is the reverse of the removal procedure. Tighten the fuel line couplings to 20 ft. lbs.

6. Lower the vehicle.

Electric Fuel Pump

PRESSURE TESTING

1. Turn the engine **OFF** and relieve the fuel system pressure.

2. Disconnect the negative battery cable. Plug the Thermac vacuum port.

3. Disconnect the fuel supply line in the engine compartment. Install a suitable pressure gauge and T in the fuel line.

4. Connect the negative battery cable.

5. Start the engine and observe the pressure reading. The fuel pressure should be 9-13 psi.

6. If the fuel pressure is not to specification, the fuel system must be completely checked.

REMOVAL & INSTALLATION

1. Properly relieve the fuel system pressure, as required.

2. Disconnect the negative battery cable.

3. Drain the fuel from the vehicle, into a suitable container.

4. Raise and safely support the vehicle.

5. Disconnect the fuel lines from the fuel tank. Disconnect the electrical leads from the fuel tank.

6. Disconnect the fuel filler neck from the tank.

7. Remove the tank mounting bolts and carefully lower the tank from the vehicle.

8. Remove the pump and pick-up assembly retaining ring and remove the pump from the tank.

9. Installation is the reverse of the removal procedure. Torque the tank retaining bolts to 26 ft. lbs.

Fuel Injection

IDLE SPEED ADJUSTMENT

2.5L Engine

The throttle stop screw that is used to adjust the idle speed of the vehicle, is adjusted to specifications at the factory. The throttle stop screw is then covered with a steel plug to prevent the unnecessary readjustment in the field. If it is necessary to gain access to the throttle stop screw, the following procedure will allow access to the throttle stop screw without removing the TBI unit from the manifold.

1. Using a small punch or equivalent mark over the center line of the throttle stop screw. Drill a $\frac{5}{32}$ in. diameter hole through the casting of the hardened steel plug.

2. Using a $\frac{1}{16}$ in. diameter punch or equivalent punch out the steel plug.

3. With the transmission in the **P** (for automatic transmission equipped vehicles) position or neutral (manual transmission equipped vehicles), the parking brake applied and the drive wheels blocked, remove the air cleaner and plug the thermac vacuum port.

4. On vehicles equipped with automatic transmission, remove the transmission detent cable from the throttle control bracket in order to gain access to the minimum air adjustment screw.

5. Connect a tachometer to the engine and disconnect the idle air control motor connector.

6. Start the engine and let the engine reach normal operating temperature and the rpm to stabilize.

7. Install special tool J-33047 or equivalent in the idle air passage of the throttle body. Be sure to seat the tool in the air passage until it is bottomed out and no air leaks exist.

8. On the 2.5L engine, use a No. 20 torx head bit or equivalent, turn the throttle stop screws until the rpm is within specification.

9. If removed install the isolator. Install the transmission detent cable, as required.

10. Shut down the engine and re-

move the special tool or equivalent from the throttle body.

11. Reconnect the idle air control motor connector and seal the hole drilled through the throttle body housing with silicone sealant or equivalent.

12. Check the throttle position sensor voltage as required. Install the air cleaner and Thermac vacuum line.

2.8L, 3.1L and 4.3L Engines

1. Remove the air cleaner, adapter and gaskets. Discard the gaskets. Plug any vacuum line ports, as necessary.

2. Leave the idle air control (IAC) valve connected and ground the diagnostic terminal (ALDL connector).

3. Turn the ignition switch to the **ON** position, do not start the engine. Wait for at least 30 seconds (this allows the IAC valve pintle to extend and seat in the throttle body).

4. With the ignition switch still in the **ON** position, disconnect IAC electrical connector.

5. Remove the ground from the diagnostic terminal and start the engine. Let the engine reach normal operating temperature.

6. Apply the parking brake and block the drive wheels. Remove the plug from the idle stop screw by piercing it first with a suitable tool, then applying leverage to the tool to lift the plug out.

7. With the engine in the proper shifter selector range adjust the idle stop screw to specification.

8. Turn the ignition **OFF** and reconnect the IAC valve connector. Unplug any plugged vacuum line ports and install the air cleaner, adapter and new gaskets.

Fuel Injector

REMOVAL & INSTALLATION

1. Relieve the fuel system pressure. Disconnect the negative battery cable. Remove the air cleaner assembly.

2. Remove the fuel injector wire. Remove the fuel injector retainer clip screws. Remove the fuel injector retainer clip.

3. Using a small pair of pliers, gently grasp the center collar of the injector, between the electrical terminals and carefully remove the injector using a lifting and twisting motion.

4. Discard the upper and lower O-rings. Note that the back up ring fits over the upper O-ring.

5. Installation is the reverse of the removal procedure. Lubricate both O-rings with light oil before installation.

EMISSION CONTROLS

Please refer to "Emission Control" in the Unit Repair section for system maintenance procedures. Due to the complex nature of modern electronic engine control systems, comprehensive diagnosis and testing procedures fall outside the confines of this repair manual. For complete information on diagnosis, testing and repair procedures concerning all modern engine and emission control systems, please refer to "Chilton's Guide to Electronic Engine Controls".

Emission Warning Lamps

These vehicles are equipped with an "Service Engine Soon" light. This will illuminate only when a malfunction in the compute command control system occurs. The light can not be reset until the malfunction is corrected and the ECM memory is cleared of the fault.

ENGINE MECHANICAL

NOTE: Disconnecting the battery cable on some vehicles may interfere with the functions of the on board computer systems and may require the computer to undergo a relearning process, once the negative battery cable is disconnected.

Engine

REMOVAL & INSTALLATION

Pick-Up, Blazer and Jimmy

1. Disconnect the negative battery cable. Matchmark the hood hinges and remove the hood.
2. Drain the cooling system and disconnect the upper radiator hose at the radiator. Disconnect the coolant overflow hose.
3. Remove the upper fan shroud and disconnect the oil cooler lines.
4. Remove the radiator and the cooling fan. Disconnect the heater hoses.
5. Remove the air cleaner assembly and disconnect the vacuum hoses. Dis-

connect all necessary wires at the bulkhead and all of the main feed wires.

6. Disconnect the throttle cable and cruise control cable (if equipped). Remove the distributor cap.

7. Raise and safely support the vehicle. Disconnect the converter-to-exhaust pipe bolts. Remove the front drive shaft on 4WD vehicles.

8. Disconnect the exhaust pipes at the manifolds. Disconnect the strut rods at the bell housing. Remove the flywheel cover.

9. Remove the torque converter bolts on automatic transmission equipped vehicles. Remove the second crossmember on 4WD vehicles.

10. Remove the rear catalytic converter shield and disconnect the converter hanger at the exhaust pipe.

11. Remove the lower fan shroud and disconnect the fuel lines. Remove the 2 outer air dam bolts.

12. Remove the 2 left body mount bolts and, using a suitable jack, raise the body slightly. Remove the engine-to-transmission bolts.

13. Lower the body and remove the lower motor mount bolts. Lower the vehicle.

14. Remove the air conditioning compressor and power steering pump with their brackets from the engine. Do not disconnect the fluid or refrigerant lines.

15. Support the transmission with a suitable jack. Attach a suitable lifting device to the engine and remove the engine from the vehicle.

To install:

16. Carefully lower the engine into position in the vehicle.

17. Remove the transmission support. Raise and safely support the vehicle. Install the motor mount bolts, tighten to 52 ft. lbs. (70 Nm). Install the lower bell housing bolts. Tighten to 32 ft. lbs. (44 Nm).

18. Raise the body and install the upper bell housing bolts. Tighten to 32 ft. lbs. (44 Nm).

19. Lower the body and install the body mount bolts. Install the outer air dam bolts. Connect the fuel lines and install the lower fan shroud.

20. Connect the converter hanger at the exhaust pipe and install the shield at the converter. Install the torque converter bolts and install the flywheel cover.

21. Connect the strut rods at the bell housing. Connect the exhaust pipes to the manifolds. Connect the converter to the exhaust pipes.

22. Lower the vehicle. Install the air conditioning compressor and power steering pump. Install the distributor cap.

23. Connect the throttle cable and

cruise control cable. Connect all electrical wires and vacuum hoses.

24. Install the air cleaner and connect the heater hoses. Install the fan and radiator. Connect the oil cooler lines. Install the upper fan shroud.

25. Connect the overflow hose and the radiator hose. Fill the cooling system.

26. Install the hood. Connect the negative battery cable and run the engine. Bleed the cooling system.

Astro and Safari

1. Disconnect the negative battery cable.

2. Drain the cooling system.

3. Raise and safely support the vehicle. Disconnect the exhaust pipes at the manifolds.

4. Disconnect the strut rods at the flywheel housing. Remove the flywheel cover. Remove the torque converter bolts. Drain the engine oil.

5. Remove the starter and oil filter. Disconnect the wires at the transmission. Disconnect the fuel lines.

6. Disconnect the oil cooler lines. Remove the lower fan shroud. Remove the motor mount bolts.

7. Lower the vehicle. Remove the headlight bezels and grille. Remove the radiator close out panel and the radiator support brace. Remove the lower tie bar.

8. Remove the hood latch mechanism. Remove the master cylinder and the upper fan shroud.

9. Remove the upper radiator core support and the radiator. If equipped, properly discharge the air conditioning system.

10. Remove the radiator filler panels. Remove the engine cover. Remove the air conditioning hose at the accumulator and remove the air conditioning compressor.

11. Remove the power steering pump. Disconnect the vacuum hoses at the intake manifold and the wiring at the bulkhead.

12. Remove the right kickpanel. Disconnect the harness at the ESC module and it through the bulkhead.

13. Remove the distributor cap. Remove the air conditioning accumulator, if equipped.

14. Disconnect the fuel lines. Remove the diverter valve. Remove the transmission dipstick tube.

15. Disconnect the heater hoses at the heater core. Remove the horn and remove the AIR system check valves. Remove the engine-to-transmission bolts.

16. Attach a suitable lifting device to the engine and remove the engine from the vehicle.

To install:

17. Install the engine into the vehicle. Install the bell housing bolts.

18. Install the AIR system check valves. Install the horn and connect the heater hoses. Install the transmission dipstick tube.

19. Install the diverter valve and connect the fuel lines. Install the accumulator and install the distributor cap.

20. Connect the harness to the ESC module. Install the right kick panel.

21. Connect the bulkhead wiring and the vacuum hoses. Install the power steering pump and the air conditioning compressor.

22. Connect the refrigerant line to the accumulator. Install the engine cover.

23. Install the radiator filler panel and the radiator. Install the radiator supports and the upper fan shroud.

24. Install the hood latch and the master cylinder. Install the lower tie bar. Install the lower radiator close out panel.

25. Install the grille and headlight bezels. Raise and safely support the vehicle.

26. Install the engine mount bolts and tighten to 75 ft. lbs (100 Nm). Connect the oil cooler lines. Connect the fuel hoses and the wires at the transmission.

27. Install the oil filter and the starter. Install the torque converter bolts. Install the flywheel cover.

28. Install the strut rods at the flywheel housing. Connect the exhaust pipes. Lower the vehicle.

29. Connect the negative battery cable. Fill the cooling system and the crankcase. Charge the air conditioning system. Fill and bleed the brake system.

Lumina APV, Silhouette, Trans Sport

1. Disconnect the negative battery cable.

2. Drain the cooling system. Disconnect the air flow tube from the air cleaner.

3. Disconnect the electrical connector from the ECM and push it through to the engine compartment. Disconnect the harness from the clips on the body and lay it across the engine.

4. Disconnect the engine harness at the bulkhead connector. Disconnect the throttle and TV cables.

5. Disconnect the fuel lines. Disconnect the transaxle shift linkage.

6. Disconnect the cooler lines at the radiator. Disconnect the radiator and heater hoses.

7. Remove the air conditioning compressor from the bracket and support it out of the way. Remove the upper engine support strut.

8. Raise and safely support the vehicle. Remove the front wheel and tire assemblies.

9. Remove the stabilizer bar. Disconnect the tie rod ends and the lower control arm ball joints.

10. Disconnect the halfshafts and support them out of the way. Disconnect the steering shaft pinch bolt.

11. Remove the starter.

12. Disconnect the exhaust pipe at the manifold. Support the engine and sub-frame with a suitable jack.

13. Remove the sub-frame bolts and lower the engine/transaxle and subframe from the vehicle.

To install:

14. Raise the engine assembly into position and install the subframe bolts. Tighten to 35 ft. lbs.

15. Connect the exhaust pipe at the rear manifold. Install the starter.

16. Connect the steering shaft and install the pinch bolt. Connect the halfshafts to the transaxle.

17. Connect the lower control arm ball joints to the steering knuckles.

18. Install the stabilizer bar. Install the upper engine strut.

19. Install the wheel and tire assemblies. Lower the vehicle. Install the radiator and heater hoses.

20. Install the shift linkage. Connect the fuel lines and the throttle and TV cables.

21. Connect the harness to bulkhead connector. Connect the ECM harness to the ECM.

22. Connect the air cleaner hose and the radiator upper support.

23. Fill the cooling system. Install the air conditioning compressor.

24. Connect the negative battery cable.

Cylinder Head

REMOVAL & INSTALLATION

2.5L Engine

1. Disconnect the negative battery cable. Drain the cooling system. On Astro and Safari vehicles, remove the engine cover. Remove the air cleaner assembly.

2. Remove the air conditioning compressor and position it to the side. Remove the rocker arm cover. Remove the rocker arms and pushrods. Keep them in order for reinstallation.

3. Properly relieve the fuel system pressure. Disconnect the fuel line from the TBI unit. Disconnect all necessary electrical and vacuum lines.

4. Disconnect the accelerator cable, the cruise control cable and the TV cables. Remove the alternator and brackets.

5. Remove the water pump bypass hose. Disconnect the heater hoses at the intake manifold. Remove the upper radiator hose.

Cylinder head bolt torque sequence—2.5L engine

Cylinder head bolt torque sequence—2.8L and 3.1L engines

FRONT

Cylinder head bolt torque sequence—4.3L engine

6. Disconnect the exhaust pipe from the exhaust manifold. Remove the fuel filter and filter brackets at the rear of the cylinder head assembly.

7. Remove the coil wire and spark plug wires. Disconnect the oxygen sensor electrical wire.

8. Remove the cylinder head retaining bolts. Remove the cylinder head along with the intake and exhaust manifold assembly.

9. Installation is the reverse of the removal procedure. Be sure that the cylinder bolt threads in the block and threads on the bolts are cleaned, as dirt will affect bolt torque.

10. Coat the threads of the 2 cylinder head bolts that use studs on top of the bolt head with sealing compound 1052080 or equivalent.

11. Position the new gasket over the dowel pins. Torque the cylinder head

bolts a little at a time, to specification, and in the proper sequence.

2.8L, 3.1L and 4.3L Engines

1. Disconnect the negative battery cable. Drain the radiator. Remove the intake manifold.

2. Remove the valve covers. Remove the rocker arms and pushrods. Keep them in order for reinstallation.

3. Raise and support the vehicle safely. Disconnect the exhaust manifolds from the exhaust pipes. On the left side disconnect the dipstick tube attachment. On the right side remove the alternator bracket. Lower the vehicle.

4. Remove the cylinder head retaining bolts. Remove the cylinder head from the engine along with the exhaust manifold.

5. Installation is the reverse of the removal procedure. Be sure that the cylinder bolt threads in the block and threads on the bolts are cleaned, as dirt will affect bolt torque.

6. Coat the threads of the cylinder head bolts with sealing compound 1052080 or equivalent.

7. Position the new gasket over the dowel pins with **THIS SIDE UP** showing. Torque the cylinder head bolts a little at a time, to specification, and in the proper sequence.

4.3L Engine

1. Disconnect the negative battery cable. Remove the engine cover. Drain the radiator. Remove the intake manifold. Remove the required electrical and vacuum connections.

2. Remove the valve covers. Remove the rocker arms and pushrods. Keep them in order for reinstallation. Remove the spark plugs.

3. Raise and support the vehicle safely. Remove the exhaust manifolds. On the left side, disconnect the dipstick tube attachment. On the right side, remove the alternator bracket. Lower the vehicle.

4. Remove the cylinder head retaining bolts. Remove the cylinder head from the engine.

5. Installation is the reverse of the removal procedure. Be sure that the cylinder bolt threads in the block and threads on the bolts are cleaned, as dirt will affect bolt torque.

6. If a steel gasket is used, be sure to coat both sides with sealer. Coat the threads of the cylinder head bolts with sealing compound 1052080 or equivalent.

7. Position the new gasket over the dowel pins. Torque the cylinder head bolts a little at a time, to specification and in the proper sequence.

Valve Lash

ADJUSTMENT

2.8L and 4.3L Engines

1. On Astro and Safari vehicles, remove the engine cover. Remove the rocker covers.

2. Crank the engine until the mark on the damper aligns with the **0** on the timing tab and the engine is in the No. 1 firing position.

3. With the engine in the No. 1 firing position, the following valves may be adjusted on the 2.8L engine:

- a. Exhaust—1, 2, 3
- b. Intake—1, 5, 6

4. With the engine in the No. 1 firing position, the following valves may be adjusted on the 4.3L engine:

- a. Exhaust—1, 5, 6
- b. Intake—1, 2, 3

5. Back out the adjusting nut until lash is felt at the pushrod then turn in the nut until all lash is removed. When all lash has been removed, turn the adjusting nut in 1½ turns more.

6. Crank the engine until the mark on the damper aligns with the **0** mark on the timing tab. This is the No. 4 firing position.

7. With the engine in the No. 4 timing position, the following valves can be adjusted on the 2.8L engine:

- a. Exhaust—4, 5, 6
- b. Intake—2, 3, 4

8. With the engine in the No. 4 timing position, the following valves can be adjusted on the 4.3L engine:

- a. Exhaust—2, 3, 4
- b. Intake—4, 5, 6

9. Back out the adjusting nut until lash is felt at the pushrod then turn in the nut until all lash is removed. When all lash has been removed, turn the adjusting nut in 1½ turns more.

10. After all valves are adjusted, install the valve covers.

Rocker Arms

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. On Astro and Safari, remove the engine cover.

2. Remove all the necessary components in order to gain access to the engine valve covers. On the 2.5L engine, properly relieve the fuel system pressure before disconnecting any fuel lines.

3. Remove the valve cover retaining bolts. Remove the valve cover from the engine.

4. Remove the rocker arm assemblies. Keep them in order for reinstallation.

5. Installation is the reverse of the

removal procedure. Be sure to use new gaskets or RTV sealant.

Intake Manifold

REMOVAL & INSTALLATION

2.5L Engine

1. Disconnect the negative battery cable. Remove the air cleaner assembly.

2. Drain the cooling system. Disconnect the vacuum pipe rail at the exhaust and thermostat housing.

3. Disconnect the electrical and vacuum connections, as required.

4. Disconnect the accelerator cable at the TBI unit.

5. Properly relieve the fuel pressure. Disconnect and plug the fuel lines at the intake manifold.

6. Disconnect the heater hoses at the intake manifold.

7. Remove the alternator bracket retaining bolts. Remove the alternator and position it aside. Remove the ignition coil.

8. Remove the intake manifold retaining bolts. Remove the intake manifold.

To install:

9. Install the manifold and gasket into position. Install the retaining bolts and tighten in sequence to the correct torque.

10. Install the alternator and bracket. Connect the heater hoses, vacuum and fuel lines.

11. Connect the accelerator cable. Install the air cleaner assembly. Install the coil.

12. Connect the negative battery cable. Fill the cooling system. Run the engine, check the idle speed and check for leaks.

2.8L and 3.1L Engines

1. Disconnect the negative battery cable. Drain the cooling system. If equipped, remove the AIR pump and bracket.

2. Remove the distributor. Remove the heater and radiator hoses from the intake manifold. Remove the power brake vacuum hose.

3. Disconnect and label all vacuum hoses. Remove the EFE pipe from the rear of the manifold. Remove the accelerator linkage. Disconnect and plug the fuel line.

4. As required, remove the TBI unit. Remove the intake manifold retaining bolts. Remove the intake manifold from the engine.

To install:

5. The gaskets are marked for right and left side installation. Do not interchange them. Clean the sealing sur-

Intake manifold mounting — 2.5L engine

INITIAL TIGHTENING SEQUENCE

FINAL TIGHTENING SEQUENCE

Intake manifold bolt torque sequence — 4.3L engine

face of the engine block and apply a $\frac{3}{16}$ in. bead of silicone sealer to each ridge.

6. Install the new gaskets onto the heads. The gaskets will have to be cut slightly to fit past the center pushrods. Do not cut any more material than necessary. Hold the gaskets in place by extending the ridge bead of sealer $\frac{1}{4}$ in. onto the gasket ends. Install the manifold and tighten the bolts in sequence to the correct torque.

7. When the intake manifold is installed the area between the ridges and

the manifold should be completely sealed.

8. The remainder of the installation is the reverse of the removal procedure.

4.3L Engine

1. Disconnect the negative battery cable. Remove the engine cover assembly. Remove the air cleaner assembly.

2. Drain the cooling system. Remove the distributor cap and ignition wires.

3. Disconnect the ESC connector and remove the distributor.

4. Remove the detent and accelerator cables. If equipped, remove the air conditioning compressor rear brace.

5. Remove the transmission and engine oil filler tubes at the alternator brace. Remove the cruise control transducer, if equipped.

6. If equipped, remove the air conditioning idler pulley at the alternator brace. Remove the alternator brace.

7. Disconnect the fuel lines. Remove the necessary vacuum hoses and electrical wires.

8. Remove the AIR hoses and brackets. If necessary, remove the upper radiator hose. Remove the heater hose at the manifold. As required, remove the carburetor. As required remove the TBI unit.

9. Remove the intake manifold retaining bolts. Remove the intake manifold from the engine.

To install:

10. The gaskets are marked for right and left side installation. Do not interchange them. Clean the sealing surface of the engine block and apply a $\frac{3}{16}$ in. bead of silicone sealer to each ridge.

11. Install the new gaskets onto the heads. The gaskets will have to be cut slightly to fit past the center pushrods. Do not cut any more material than necessary. Hold the gaskets in place by extending the ridge bead of sealer $\frac{1}{4}$ in. onto the gasket ends. Install the manifold and tighten the bolts in sequence to the correct torque.

12. When the intake manifold is installed the area between the ridges and the manifold should be completely sealed.

13. The remainder of the installation is the reverse of the removal procedure.

Exhaust Manifold

REMOVAL & INSTALLATION

2.5L Engine

1. Disconnect the negative battery cable.

2. Remove the exhaust stove pipe at the manifold. Disconnect the oxygen sensor wire.

3. Raise and safely support the vehicle. Disconnect the exhaust pipe at the exhaust manifold.

4. Remove the rear air conditioning compressor bracket.

5. Remove the exhaust manifold retaining bolts. Remove the manifold from the engine.

6. Installation is the reverse of the removal procedure. Torque the manifold to the correct specification.

2.8L and 3.1L Engines

1. Disconnect the negative battery cable. Disconnect the exhaust pipe from the manifold.

2. Raise and support the vehicle safely. Remove the rear manifold retaining bolts.

3. Remove the air management hoses and electrical connections. Lower the vehicle. Remove the accessory drive belt.

4. If equipped, remove the power steering bracket when removing the left manifold.

5. Remove the remaining manifold attaching bolts. Remove the manifold from the engine.

6. Installation is the reverse of the removal procedure.

4.3L Engine

1. Disconnect the negative battery cable. On Astro and Safari, remove the engine cover. Raise and support the vehicle safely.

2. Disconnect the exhaust pipes from the exhaust manifolds. Lower the vehicle.

3. To remove the right manifold, disconnect the heat stove pipe and the dipstick tube bracket.

4. To remove the left manifold, disconnect the oxygen sensor wire.

5. Disconnect the power steering bracket at the manifold, if equipped. Disconnect the alternator bracket at the manifold.

6. Remove the AIR hoses at the

Exhaust manifold bolt torque sequence—2.5L engine

Exhaust manifold mounting—2.8L engine

Exhaust manifold mounting—3.1L engine

Exhaust manifold mounting—4.3L engine

check valve. Remove the exhaust manifold retaining bolts. Remove the manifold from the engine.

7. Installation is the reverse of the removal procedure.

Timing Gear Front Cover

REMOVAL & INSTALLATION

2.5L Engine

1. Disconnect the negative battery cable. Drain the cooling system.

2. Remove the power steering fluid reservoir from its mounting and support it aside.

3. Remove the upper fan shroud. Remove the accessory drive belt.

4. Disconnect the wiring from the alternator. Remove the alternator and its mounting brackets.

5. Remove the crankshaft pulley and hub. Disconnect the lower radiator hose at the water pump.

6. Remove the cover retaining bolts and remove the cover.

To install:

7. Lubricate the crankshaft seal with clean oil. Apply a 10mm bead of RTV sealer to oil pan lips. Apply a 6mm wide bead of RTV to the timing cover.

8. Install the cover in position on the engine. Tighten the retaining bolts to 90 inch lbs.

9. Install the crankshaft pulley and hub. Connect the lower radiator hose to the water pump.

10. Install the alternator and its mounting brackets. Install the accessory drive belt.

11. Install the fan shroud and the power steering reservoir.

12. Refill the cooling system and connect the negative battery cable.

13. Run the engine and check for leaks.

Timing Chain Front Cover

REMOVAL & INSTALLATION

2.8L and 4.3L Engines

1. Disconnect the negative battery cable.

2. Drain the cooling system.

3. Remove the accessory drive belt.

4. Remove the water pump. Remove the power steering pump bracket.

5. Remove the crankshaft pulley and damper.

6. Disconnect the lower radiator hose. Remove the front cover retaining bolts.

7. Remove the front cover. Remove

Front cover assembly 2.5L engine—exploded view

Front cover assembly 3.1L engine—exploded view

the old gasket material from the engine and the cover.

To install:

8. Install a new gasket in position. Install the front cover and tighten the retaining bolts to 18 ft. lbs. (24 Nm).

9. Install the water pump. Connect the lower radiator hose.

10. Install the crankshaft damper and pulley. Install the power steering mounting bracket.

11. Refill the cooling system to the correct level.

12. Connect the negative battery cable and bleed the cooling system.

3.1L Engine

1. Disconnect the negative battery cable.

2. Drain the cooling system.

3. Remove the accessory drive belt and tensioner.

4. Remove the power steering pump.

5. Raise and safely support the vehicle. Remove the splash shield.

6. Drain the engine oil. Remove the crankshaft pulley and damper. Remove the starter and support it to the side.

7. Place a suitable jack under the engine-to-transaxle mount.

8. Remove the engine mount bolts and the engine mount. Raise the engine slightly.

9. Remove the lower front cover bolts and lower the oil pan. Remove the radiator hose at the water pump.

10. Remove the heater hose at the cooling system fill pipe. Remove the bypass and overflow hoses.

11. Remove the remaining front cover bolts and remove the front cover.

To install:

12. Clean all gasket mating surfaces. Install a new gasket in position on the engine block.

13. Apply sealer to the lower edges of the front cover. Install the front cover in position on the engine block. Tighten the upper bolts to 20 ft. lbs. (27 Nm).

14. Install the oil pan in position. Install the lower cover bolts and tighten to 28 ft. lbs. (38 Nm).

15. Install the engine mount to the engine and lower the engine into position.

16. Install the crankshaft damper and pulley. Install the flywheel cover and inner splash shield.

17. Install the starter. Connect the heater bypass hose and the slower radiator hose to the water pump. Lower the vehicle.

18. Install the power steering pump

bracket. Install the accessory drive belt and tensioner.

19. Refill the cooling system and the crankcase to the correct levels.

20. Connect the negative battery cable. Run the engine to normal operating temperature and check for leaks.

Front Cover Oil Seal

REPLACEMENT

The front cover seal can be replaced while the front cover is still on the vehicle. It is recommended by the manufacturer that the seal be replaced whenever the front cover is removed.

1. Disconnect the negative battery cable.

2. Remove the accessory drive belt.

3. Remove the crankshaft pulley and damper.

4. Using a suitable tool, pry the seal from the cover.

5. Lubricate the replacement seal with clean engine oil.

6. Using a suitable seal installer, position the seal on the crankshaft.

7. Install the crankshaft damper and pulley.

8. Install the accessory drive belt.

9. Connect the negative battery cable.

Timing mark alignment—2.8L and 3.1L engines

Timing mark alignment—4.3L engine

Timing Chain and Sprockets

REMOVAL & INSTALLATION

2.8L, 3.1L and 4.3L Engines

1. Disconnect the negative battery cable. Drain the coolant.
2. Remove the front cover assembly.
3. Crank the engine until the marks punched on both sprockets are closest to one another and in line between the shaft centers.
4. Remove the bolts that hold the camshaft sprocket to the camshaft. This sprocket is a light press fit on the camshaft.
4. Remove the timing chain. Using the proper tools remove the crankshaft sprocket, as required.
5. Installation is the reverse of the removal procedure. After the sprockets are in place, turn the engine 2 full revolutions to make certain that the timing marks are in correct alignment between the shaft centers.

Camshaft and Timing Gear

REMOVAL & INSTALLATION

2.5L Engine

1. Disconnect the negative battery cable. Drain the cooling system. Remove the radiator.
2. Remove the engine side cover. Remove the air cleaner assembly. Remove the EGR valve.
3. Disconnect the power steering reservoir and position it to the side. Remove the drive belts and pulleys. Remove the upper fan shroud. Remove the front cover.
4. Rotate the crankshaft until the timing marks are in alignment. Remove the distributor assembly. Remove the oil pump drive shaft cover and drive shaft.
5. Remove the rocker cover. Remove the rockers and pushrods. Keep them in order for reinstallation. Remove the valve lifters. Keep them in order for reinstallation.

6. If equipped with air conditioning, it may be necessary to reposition the condenser in order to withdraw the camshaft from the engine. If the condenser must be removed, properly discharge the system before condenser removal.

7. Remove the headlight bezel and grille assembly.

8. Remove the camshaft thrust plate bolts. Carefully remove the camshaft from the vehicle.

To install:

9. Lubricate the camshaft lobes with Molykote or equivalent before installation.

10. Install the camshaft into the block, use care not to damage the bearings. Align the timing marks on the camshaft gear and the crankshaft gear.

11. Install the thrust plate bolts and tighten to 90 inch lbs.

12. Install the front cover. Install the distributor and the oil pump shaft cover.

13. Install the lifters, pushrods, rocker arms and the engine side cover.

14. Install the remaining components in the reverse order of removal.

15. Refill the cooling system and connect the negative battery cable.

Camshaft

REMOVAL & INSTALLATION

2.8L and 4.3L Engines

1. Disconnect the negative battery cable.
2. Drain the cooling system.
3. Remove the upper fan shroud.
4. Remove the radiator.
5. Remove the valve cover and the valve train components. Remove the intake manifold assembly.
6. Remove the front cover assembly.
7. Remove the timing chain and sprocket.
8. Remove the camshaft from the block by pulling it out. Use care not to damage the bearings.

To install:

9. Lubricate the camshaft with Molykote or equivalent, before installation.

10. Install the camshaft into the cylinder block, use care not to damage the bearings.

11. Install the timing chain and sprocket. Make sure that the timing marks align correctly.

12. Install the front cover assembly.

13. Install the intake manifold assembly. Install the valve train components and the valve cover.

14. Install the radiator and the fan shroud.

15. Fill the cooling system to the correct level and connect the negative battery cable.

3.1L Engine

1. Disconnect the negative battery cable.

2. Drain the cooling system.

3. Remove the engine from the vehicle and support it in a suitable holding fixture.

4. Remove the intake manifold. Remove the valve cover and the valve train components.

5. Remove the front cover assembly.

6. Remove the timing chain and sprocket.

7. Remove the camshaft from the block by pulling it out. Use care not to damage the bearings.

To install:

8. Lubricate the camshaft with Molykote or equivalent, before installation.

9. Install the camshaft into the cylinder block, use care not to damage the bearings.

10. Install the timing chain and sprocket. Make sure that the timing marks align correctly.

11. Install the front cover assembly.

12. Install the intake manifold assembly. Install the valve train components and the valve cover.

13. Install the engine into the vehicle.

14. Fill the cooling system to the correct level and connect the negative battery cable.

Piston and Connecting Rod

POSITIONING

Piston and ring positioning

Timing gear assembly and timing mark alignment—2.5L engine

ENGINE LUBRICATION

Oil Pan

REMOVAL & INSTALLATION

2WD Vehicles

1. Disconnect the negative battery cable.
2. Remove the power steering reservoir and support it aside.
3. Remove the radiator shroud.
4. Raise and safely support the vehicle.
5. Drain the engine oil.
6. Disconnect the strut rods. Disconnect the exhaust pipes at the manifolds.
7. Remove the catalytic converter and exhaust pipe.
8. Remove the flywheel cover. Remove the starter and brace.
9. Remove the brake lines from the crossmember. Remove the front engine mounting bolts.
10. Raise the engine slightly, with a suitable lifting device and insert wooden blocks to hold it.
11. Remove the oil pan retaining bolts and remove the oil pan.

To install:

12. Apply RTV sealant to the oil pan flange and block. Install the oil pan into position.
13. Install the oil pan bolts and tighten to 90 inch lbs. (10 Nm).
14. Remove the blocks and lower the engine. Install the engine mount bolts.

Oil pan assembly—4.3L engine

15. Connect the brake line at the crossmember. Install the starter and brace.

16. Install the flywheel cover. Install the catalytic converter and the exhaust pipe.

17. Install the strut rods. Lower the vehicle. Install the radiator shroud.

18. Install the power steering reservoir. Refill the crankcase with the correct level of oil.

19. Connect the negative battery cable.

4WD Vehicles

1. Disconnect the negative battery cable.
2. Remove the power steering pump from the fan shroud and remove the fan shroud.
3. Remove the crankcase dipstick. Raise and safely support the vehicle.
4. Drain the engine oil. Remove the brake line from the clips at the crossmember. Remove the crossmember.
5. Remove the transmission cooler lines at the flywheel cover bracket, if equipped.
6. Disconnect the exhaust pipe at the manifold. Remove the catalytic converter hanger.
7. Remove the flywheel cover. Remove the driveshaft splash shield.
8. Disconnect the idler arm assembly. Remove the steering gear retaining bolts and pull the gear and linkage forward.
9. Place a suitable support under the front differential housing and remove the differential support bracket bolts.
10. Move the differential assembly forward.
11. Remove the starter and brace.
12. Disconnect the front driveshaft at the pinion. Remove the engine mount through bolts.
13. Raise the engine slightly, using a suitable jack.
14. Remove the oil pan retaining bolts and remove the oil pan.

To install:

15. Clean all sealant from the block and the oil pan.
16. Apply a bead of RTV to the oil pan flange and to the sealing surfaces of the block.
17. Install the oil pan in position and install the retaining bolts. Tighten to 90 inch lbs.
18. Lower the engine and install the engine mount through bolts. Connect the front driveshaft at the drive pinion.
19. Install the starter and brace. Pull the differential back into position and install the retaining bolts.
20. Install the steering gear and idler arm assembly mounting bolts.

21. Install the driveshaft shield and the flywheel cover.

22. Install the catalytic converter hanger and connect the exhaust pipe at the manifold.

23. Reconnect the transmission cooler lines to the clips at the flywheel housing.

24. Install the crossmember and reposition the brake lines. Lower the vehicle.

25. Install the dipstick. Refill the crankcase with oil. Install the upper fan shroud.

26. Install the power steering fluid reservoir. Connect the negative battery cable.

Lumina APV, Silhouette and Trans Sport

1. Disconnect the negative battery cable. Remove the accessory drive belt.
2. Raise and safely support the vehicle.
3. Remove the crankshaft damper and pulley.
4. Drain the engine oil. Remove the flywheel shields.
5. Remove the starter. Support the engine with a suitable jack.
6. Remove the engine mounting bolts.
7. Raise the engine slightly.
8. Remove the oil pan bolts and the oil pan.

To install:

9. Install a new oil pan gasket and install the oil pan. Tighten M8 oil pan bolts to 19 ft. lbs. (25 Nm) and the M6 oil pan bolts to 7 ft. lbs. (10 Nm).
10. Lower the engine and install the engine mounting bolts.
11. Install the starter and flywheel shields.
12. Install the crankshaft damper and pulley.
13. Lower the vehicle and install the accessory drive belt.
14. Refill the crankcase and connect the negative battery cable.

Oil Pump

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Raise and safely support the vehicle.
3. Drain the engine oil. Remove the oil pan.
4. Remove the oil pump retaining bolt and lower the pump from the block.
5. Remove the pump shaft.
6. Install the pump in position on the block with the retainer facing the rear of the block.

Oil pump mounting—2.8L, 3.1L and 4.3L engines

7. Install the pump retaining bolt and tighten to 30 ft. lbs. (41 Nm).
8. Install the oil pan.
9. Lower the vehicle. Refill the crankcase with oil.
10. Connect the negative battery cable.

Rear Main Oil Seal

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Raise and safely support the vehicle.
3. Remove the transmission from the vehicle.
4. Remove the flywheel (and clutch on manual transmission equipped vehicles).
5. Remove the oil seal by prying it out with a suitable tool.
6. Coat the seal lips with oil and install it on a suitable seal installer tool.
7. Using the tool, install it in the block. Make sure it is fully seated.
8. Install the flywheel. Install the transmission.
9. Lower the vehicle. Connect the negative battery cable.

One piece rear main seal installation

cable. As required, on 4 speed transmission equipped vehicles, remove the upper starter mounting screw.

2. Shift the transmission into neutral and remove the shift lever boot. Raise and support the vehicle safely. Drain the fluid.

3. Remove the shift lever assembly. If equipped, remove the parking brake lever and controls. Remove the drive-shaft. If equipped, drain and remove the transfer case.

4. Disconnect the speedometer cable at the transmission. Disconnect all electrical wires, as required.

5. Disconnect and remove exhaust components, as required. Properly support the transmission assembly. Remove the clutch slave cylinder from its mounting.

6. Remove the transmission assembly retaining bolts. Remove the transmission crossmember retaining bolts. Remove the transmission mount retaining bolts. Remove the crossmember from the vehicle.

7. As required, on 4 speed transmission equipped vehicles, remove the lower starter bolt and starter assembly. Properly support the clutch release bearing. Remove the engine-to-transmission bolts.

8. As required, on vehicles equipped with 4 speed transmission, remove the left body mounting bolts and loosen the radiator support screw. Raise and support the left side of the body.

9. Properly support the engine assembly. Carefully remove the transmission assembly from the vehicle.

10. Installation is the reverse of the removal procedure. Fill the transmission with the proper grade and type fluid. As adjust linkages, as required.

CLUTCH

Clutch Assembly

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Raise and support the vehicle safely. Remove the transmission. As required, remove the flywheel cover.

2. Remove the slave cylinder retaining bolts. Remove the slave cylinder from its mounting.

3. Remove the bell housing retaining bolts. Remove the bell housing from the vehicle.

4. Slide the clutch fork from the ball stud. Inspect the ball stud and replace as required.

5. Install the clutch removal tool and support the clutch assembly. Matchmark the clutch and pressure plate for reassembly.

6. Loosen the clutch plate retaining bolts slowly and evenly one at a time until all pressure is released from the pressure plate assembly.

7. Remove the clutch, pressure plate and removal tool from the vehicle. Check the flywheel for damage, repair or replace, as required.

8. Installation is the reverse of the removal procedure. Adjust the clutch, as required. Bleed the hydraulic clutch system.

Clutch Master Cylinder

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Remove the under dash hush panel. Remove the lower steering column cover, as required. Remove the left side air conditioning duct work.

2. Disconnect the pushrod from the clutch pedal. Disconnect the clutch master cylinder retaining nuts.

3. Disconnect and plug the reservoir hose at the clutch master cylinder assembly.

4. Disconnect and plug the fluid line to the slave cylinder at the clutch master cylinder assembly.

5. Remove the clutch master cylinder from the vehicle.

6. Installation is the reverse of the

MANUAL TRANSMISSION

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

Transmission Assembly

REMOVAL & INSTALLATION

1. Disconnect the negative battery

Transmission Assembly

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Remove the air cleaner assembly. Disconnect the throttle valve cable and the throttle linkage.

2. Raise and support the vehicle safely.

3. Drain the transmission fluid. Disconnect the shift linkage. On some vehicles equipped with the 2.5L engine, it will be necessary to remove the upper starter bolt.

4. Remove the driveshaft. If equipped with a transfer case, disconnect the front driveshaft.

5. Disconnect and remove all required exhaust system components. Support the transmission using the proper equipment.

6. Remove the crossmember retaining bolts. Remove the transmission mount retaining bolts. Remove the crossmember from the vehicle.

7. Remove the transmission dipstick tube. Disconnect the speedometer cable. If equipped, disconnect the vacuum modulator line.

8. Disconnect all electrical connections from the transmission assembly. Disconnect and plug the fluid cooler lines.

9. If equipped, remove the transfer case assembly. Remove the damper and support, as required. Remove the flywheel housing cover.

10. Properly support the engine assembly. Removing the transmission to engine retaining bolts. Carefully remove the automatic transmission from the vehicle.

To install:

11. Install the transmission in position in the vehicle. Make sure the converter is properly seated.

12. Install the engine-to-transmission bolts and tighten to 50 ft. lbs. (68 Nm).

13. Install the converter housing cover. Install the damper and support.

14. Connect all electrical leads to the transmission and connect the speedometer cable.

15. Install the dipstick tube. Install the crossmember and install the transmission mount retaining bolts.

16. Connect all exhaust system components. Install the front driveshaft on 4WD vehicles.

17. Connect the shift linkage and install the skid plate, if equipped. Lower the vehicle.

18. Connect the TV cable and throttle linkage.

19. Install the air cleaner assembly. Connect the negative battery cable.

Clutch master cylinder mounting

Clutch slave cylinder mounting

removal procedure. Bleed the hydraulic clutch system.

Clutch Slave Cylinder

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Raise and support the vehicle safely. Disconnect and plug the fluid line at the slave cylinder.

3. Remove the slave cylinder retaining bolts. Remove the slave cylinder from the vehicle.

4. Installation is the reverse of the removal procedure. Bleed the system, as required.

BLEEDING THE HYDRAULIC CLUTCH SYSTEM

1. Fill the clutch master cylinder with the proper grade and type fluid. Raise and support the vehicle safely.

2. Remove the slave cylinder retaining bolts. Hold the cylinder at about a 45 degree angle with the bleeder at the highest point.

3. Fully depress the clutch pedal and open the bleeder screw. Repeat until all air is expelled from the system.

4. Be sure that the fluid level remains full in the clutch master cylinder throughout the bleeding procedure.

AUTOMATIC TRANSMISSION

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

20. Check the operation of the transmission.

SHIFT LINKAGE ADJUSTMENT

1. As required, raise and support the vehicle safely.
2. Loosen the linkage rod retaining nut. Note the position of any washers, spacers and insulators. Position the transmission selector lever in the N position.
3. Do not use the indicator to determine the N position. Check the transmission shift lever bracket to determine that the transmission is in the N position.
4. Hold the selector rod and tighten the swivel to 17 ft. lbs. Position the selector lever in the P detent.
5. Check the adjustment. The selector lever must go into all positions. The engine must only start in the P or N position. Align the selector indicator, as required.

TV CABLE ADJUSTMENT

1. As required, remove the air cleaner assembly.
2. Depress and hold down the metal readjust tab at the engine end of the throttle valve cable.
3. Move the slider until it stops against the fitting. Release the readjustment tab.
4. Rotate the throttle lever to its full travel position. The slider must move toward the lever when the lever is rotated to its full travel position.
5. Check for proper operation. When the engine is cold, the cable may appear to be functioning properly, check the cable when the engine is hot.
6. Road test the vehicle.

AUTOMATIC TRANSAXLE

For further information on transmissions/transaxles, please refer to "Chilton's Guide to Transmission Repair".

Transaxle Assembly

The automatic transaxle in the Lumina APV, Silhouette and Transport APV, can only be removed by removing the engine and transaxle/sub-frame as an assembly.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
 2. Drain the cooling system. Disconnect the air flow tube from the air cleaner.
 3. Disconnect the electrical connector from the ECM and push it through to the engine compartment. Disconnect the harness from the clips on the body and lay it across the engine.
 4. Disconnect the engine harness at the bulkhead connector. Disconnect the throttle and TV cables.
 5. Disconnect the fuel lines. Disconnect the transaxle shift linkage.
 6. Disconnect the cooler lines at the radiator. Disconnect the radiator and heater hoses.
 7. Remove the air conditioning compressor from the bracket and support it out of the way. Remove the upper engine support strut.
 8. Raise and safely support the vehicle. Remove the front wheel and tire assemblies.
 9. Remove the stabilizer bar. Disconnect the tie rod ends and the lower control arm ball joints.
 10. Disconnect the halfshafts and support them out of the way. Disconnect the steering shaft pinch bolt.
 11. Remove the starter.
 12. Disconnect the exhaust pipe at the manifold. Support the engine and sub-frame with a suitable jack.
 13. Remove the sub-frame bolts and lower the engine/transaxle and subframe from the vehicle.
- To install:**
14. Raise the engine assembly into position and install the subframe bolts. Tighten to 35 ft. lbs.
 15. Connect the exhaust pipe at the rear manifold. Install the starter.
 16. Connect the steering shaft and install the pinch bolt. Connect the halfshafts to the transaxle.

17. Connect the lower control arm ball joints to the steering knuckles.
18. Install the stabilizer bar. Install the upper engine strut.
19. Install the wheel and tire assemblies. Lower the vehicle. Install the radiator and heater hoses.
20. Install the shift linkage. Connect the fuel lines and the throttle and TV cables.
21. Connect the harness to bulkhead connector. Connect the ECM harness to the ECM.
22. Connect the air cleaner hose and the radiator upper support.
23. Fill the cooling system. Install the air conditioning compressor.
24. Connect the negative battery cable.

TV CABLE ADJUSTMENT

1. As required, remove the air cleaner assembly.
2. Depress and hold down the metal readjust tab at the engine end of the throttle valve cable.
3. Move the slider until it stops against the fitting. Release the readjustment tab.
4. Rotate the throttle lever to its full travel position. The slider must move toward the lever when the lever is rotated to its full travel position.
5. Check for proper operation. When the engine is cold, the cable may appear to be functioning properly, check the cable when the engine is hot.
6. Road test the vehicle.

NEUTRAL SAFETY SWITCH ADJUSTMENT

1. Place the transaxle in the N position.
2. Loosen the switch attaching screws.

3. Rotate the switch on the shifter assembly to align the service hole in the switch with the hole in the carrier.

4. Insert a $\frac{3}{32}$ in. gauge pin into the hole then tighten the mounting bolts.

5. Remove the gauge pin and check the operation of the switch.

6. The vehicle should only start in N or P.

TRANSFER CASE

Transfer Case Assembly

REMOVAL & INSTALLATION

Pick-Up, Blazer, Jimmy, Astro and Safari

1. Disconnect the negative battery cable. Shift the transfer case into the 4HI position.

2. Raise and support the vehicle safely. If equipped, remove the skid plate. Drain the fluid from the transfer case.

3. Matchmark the transfer case front output shaft yoke and driveshaft for reassembly. Disconnect the driveshaft from the transfer case.

4. Matchmark the rear axle yoke and the driveshaft for reassembly. Remove the driveshaft.

5. Disconnect the speedometer cable. Disconnect the vacuum harness and all electrical connections at the transfer case. Remove the catalytic converter hanger bolts at the converter assembly.

6. Raise the transmission and transfer case assembly. Remove the transmission mount retaining bolts. Remove the mount and the catalytic converter hanger. Lower the transmission and transfer case assembly.

7. Properly support the transfer case assembly. Remove the transfer case retaining bolts.

8. On vehicles equipped with automatic transmission, it will be necessary to remove the shift lever bracket mounting bolts from the transfer case adapter in order to remove the upper left transfer case retaining bolt.

9. Separate the transfer case from its mounting and remove it from the vehicle.

To install:

10. Install a new gasket to the transmission. Install the transfer case into the vehicle.

11. Tighten the transfer case mounting bolts to 23 ft. lbs. (31 Nm).

12. Install the shift lever bracket

bolts. Support the transmission, raise the transmission slightly.

13. Install the converter mounting bracket. Install the rear transmission mounting bolts.

14. Connect the transfer case linkage. Connect the speedometer cable.

15. Install the driveshafts. Install the skid plate if equipped.

16. Fill the transfer case to the correct level.

17. Lower the vehicle. Connect the negative battery cable.

LINKAGE ADJUSTMENT

1. Loosen the selector lever retaining bolt. Loosen the shifter pivot bolt.

2. Shift the transfer case into the 4HI position. Remove the console assembly. Raise the shifter boot out of the way.

3. Install a $\frac{5}{16}$ in. gauge pin through the shifter and into the bracket. Install a service bolt at the transfer case shift lever. This will lock the transfer case in the 4HI position.

4. Tighten the selector lever retaining bolt 25–35 ft. lbs. Tighten the shifter pivot bolt 88–103 ft. lbs.

5. Remove the service bolt. Remove the gauge pin. Install removed parts.

6. Check for proper operation.

DRIVE AXLE

Halfshaft

REMOVAL & INSTALLATION

Pick-Up, Blazer, Jimmy, Astro and Safari

1. Raise and support the vehicle safely. Remove the tire and wheel assemblies.

2. Remove the brake calipers and flex hose at their retaining brackets.

3. Using the proper tools, remove the tie rods at the steering knuckles.

4. Remove the lower shock absorber

retaining bolts and move the shock absorbers out of the way. As required, remove the skid plate.

5. Remove the halfshaft to axle tube bolts. Remove the halfshaft cotter pin, nut and washer.

6. Move the inner part of the halfshaft forward. Support it away from the frame. Using a suitable tool, remove the shaft from the hub and bearing assembly.

7. Remove the halfshaft from the vehicle.

To install:

8. Install the halfshaft into position. Push it into the hub.

9. Install the shaft retaining nut and washer. Tighten the halfshaft retaining nut to 160–200 ft. lbs. (220–270 Nm).

10. Install the cotter pin in the nut. Install the halfshaft-to-axle tube bolts and tighten to 60 ft. lbs. (80 Nm).

11. Install the lower shock absorber bolts. Connect the tie rods to the steering knuckle.

12. Install the brake calipers and hoses. Install the skid plate, if equipped.

13. Install the wheel and tire assemblies. Lower the vehicle

Lumina APV, Silhouette and Trans Sport

1. Raise and safely support the vehicle.

2. Remove the tire and wheel assemblies.

3. Remove the halfshaft retaining nut and washer.

4. Remove the brake caliper from the rotor and support it aside.

5. Remove the brake rotor from the hub.

6. Disconnect the stabilizer shaft from the control arm and disconnect the ball joint from the steering knuckle.

7. Remove the halfshaft from the transaxle using a suitable tool with a slide hammer attachment.

8. Remove the halfshaft from the hub and bearing assembly.

Front drive axle assembly—4WD vehicles

To install:

9. Install the halfshaft into the hub and bearing assembly.
10. Connect the lower ball joint to the steering knuckle.
11. Connect the stabilizer shaft to the control arm. Install the rotor.
12. Install the brake caliper. Install a new halfshaft nut and tighten the nut to 185 ft. lbs. (260 Nm).
13. Seat the halfshaft into the trans-axle, by pushing it in firmly. Check that the shaft is seated by pulling on it.
14. Install the wheel and tire assemblies.
15. Lower the vehicle.

Driveshaft and U-Joints

REMOVAL & INSTALLATION

Front 1 Piece—Except Astro and Safari

1. Raise and support the vehicle safely.
2. If equipped, remove the skid plate.
3. Matchmark the rear yoke of the driveshaft to the transfer case. Matchmark the front of the driveshaft to the differential housing.
4. Remove the bolts and retainers from the rear of the driveshaft. Remove the driveshaft from the vehicle.
5. Installation is the reverse of the removal procedure. Tighten the bolts to 15 ft. lbs. (20 Nm).

Front 1 Piece—Astro and Safari

1. Raise and support the vehicle safely.
2. Matchmark the rear of the driveshaft to the transfer case. Matchmark the front of the driveshaft to the differential housing.
4. Remove the bolts from the rear flange of the driveshaft. Remove the bolts from the front flange of the driveshaft. Lower the driveshaft and remove it from the vehicle.
5. Installation is the reverse of the removal procedure. Tighten the front flange bolts to 53 ft. lbs. (72 Nm) and the rear flange bolts to 92 ft. lbs. (125 Nm).

Rear 1 Piece

1. Raise and support the vehicle safely.
2. If equipped, remove the skid plate.
3. Matchmark the front yoke of the driveshaft to the transmission. Matchmark the rear of the driveshaft to the differential housing.
4. Remove the bolts and retainers from the rear of the driveshaft. Re-

move the driveshaft from the vehicle.

5. Installation is the reverse of the removal procedure. Tighten the bolts to 15 ft. lbs. (20 Nm).

Rear 2 Piece

1. Raise and support the vehicle safely.
2. As required, remove the skid plate.
3. Matchmark the front yoke of the driveshaft to the transmission. Matchmark the rear of the driveshaft to the differential housing.
4. Remove the center bearing bolts and washers. Remove the center bearing.
5. Remove the front driveshaft. Remove the rear driveshaft bolts and retainers. Remove the rear driveshaft.
6. Installation is the reverse of the removal procedure. When installing the center bearing, be sure to align it 90 degrees to the driveshaft center lines. Tighten the center bearing bolts to 25 ft. lbs. (34 Nm). and the driveshaft bolts to 15 ft. lbs. (20 Nm).

Rear Axle Shaft, Bearing and Seal

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely. Remove the tire and wheel assemblies. Drain the lubricant.
2. Remove the carrier cover retaining bolts. Remove the carrier cover.
3. Remove the rear axle pinion shaft lock screw and the rear axle pinion shaft. Discard the lock screw.
4. Push the flanged end of the axle shaft toward the center of the vehicle. Remove the C-lock clip from the button end of the shaft.
5. Remove the axle shaft from the housing. Be careful not to damage the oil seal. The bearing can be removed from the axle using an arbor press.

To install:

6. Slide the axle into position and

install the C-lock clip, use care not to damage the oil seal.

7. Install the pinion shaft through the case and pinion.
8. Install a new pinion shaft lock bolt, tighten it to 25 ft. lbs. (34 Nm).
9. Install the carrier cover, using a new gasket. Tighten the cover bolts to 20 ft. lbs. (27 Nm).
10. Fill the differential to within $\frac{3}{8}$ in. of the filler opening.
11. Install the brake drum. Install the wheel and tire assembly.

Front Wheel Hub, Knuckle and Bearing

REMOVAL & INSTALLATION

Pick-Up, Blazer, Jimmy, Astro and Safari

2WD VEHICLES

1. Raise and safely support the vehicle.
2. Remove the wheel and tire assemblies.
3. Remove the brake caliper and remove the brake rotor. Use care not to drop the bearings from the rotor.
4. Remove the splash shield attaching bolts and remove the splash shield from the knuckle.
5. Remove the tie rod end from the knuckle. Remove the ball studs from the knuckle.
6. Remove the steering knuckle from the lower ball stud and the knuckle from the vehicle.

To install:

7. Install the upper and lower ball joint to the knuckle.
8. Attach the splash shield to the knuckle and tighten the bolts to 10 ft. lbs. (14 Nm).
9. Connect the tie rod end to the knuckle.
10. Install the rotor and bearings onto the spindle. Adjust the bearing.
11. Install the caliper. Install the wheel and tire assembly.

1. Cap
2. Cotter pin
3. Nut
4. Washer
5. Outer bearing
6. Outer cup
7. Bolt
8. Rotor
9. Inner cup
10. Inner bearing
11. Seal
12. Bolts
13. Caliper
14. Knuckle
15. Gasket
16. Shield

Rotor, knuckle and bearing assembly—2WD vehicles except Lumina APV, Silhouette and Transport

12. Lower the vehicle. Check the front end alignment.

4WD VEHICLES

1. Raise and safely support the vehicle.

2. Remove the wheel and tire assembly.

3. Remove the brake caliper and support it aside.

4. Remove the brake rotor. Remove the halfshaft retaining nut.

5. Disconnect the tie rod end from the knuckle.

6. Remove the hub and bearing assembly mounting bolts and remove the assembly from the steering knuckle.

7. Remove the splash shield from the knuckle. Remove the ball joints from the knuckle.

8. Remove the knuckle from the ball joints and remove the spacer from the knuckle.

To install:

9. Install the spacer on the knuckle. Install the knuckle in position on the ball joints.

10. Install the ball joint nuts and cotter pins. Install the splash shield to the knuckle.

11. Install the hub and bearing assembly to the knuckle. Tighten the hub mounting bolts to 86 ft. lbs. (116 Nm). Install the halfshaft retaining nut.

12. Connect the tie rod to the knuckle. Install the brake rotor and the brake caliper.

13. Install the wheel and tire assembly. Lower the vehicle.

14. Check the front end alignment.

Lumina APV, Silhouette and Trans Sport

1. Raise and safely support the vehicle.

2. Remove the wheel and tire assembly.

- | | |
|---------------------|-------------------|
| 1. Hub and bearing | 5. Hub nut |
| 2. Steering knuckle | 6. Seal |
| 3. Shield | 7. Retaining bolt |
| 4. Washer | 8. O-ring |

Front hub and bearing assembly—
Lumina APV, Silhouette and Trans Sport

3. Remove the brake caliper and support it aside.

4. Remove the brake rotor. Remove the halfshaft retaining nut.

5. Disconnect the tie rod end from the knuckle.

6. Remove the hub and bearing assembly mounting bolts and remove the assembly from the steering knuckle.

7. Remove the strut mounting bolts from the knuckle. Remove the splash shield from the knuckle. Remove the ball joint from the knuckle.

8. Remove the knuckle from the ball joint and remove the knuckle from the vehicle. Pull it off of the halfshaft.

To install:

9. Install the knuckle in position on the ball joint. Slide the knuckle onto the halfshaft.

10. Install the ball joint nut and cotter pin. Install the splash shield to the knuckle.

11. Install the hub and bearing assembly to the knuckle. Tighten the hub mounting bolts to 86 ft. lbs. (116 Nm). Install the halfshaft retaining nut.

12. Connect the tie rod to the knuckle. Install the brake rotor and the brake caliper.

13. Install the wheel and tire assembly. Lower the vehicle.

14. Check the front end alignment.

Pinion Seal

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely. Matchmark the driveshaft and the pinion flange.

2. Disconnect the driveshaft from the rear differential. Support the driveshaft out of the way.

3. Mark the position of the pinion flange, pinion shaft and nut. Remove the pinion flange nut and washer.

4. Remove the pinion flange. Position a drain pan under the assembly to catch any excess lubricant.

5. Using the proper tool, remove the seal from its mounting.

6. Installation is the reverse of the removal procedure. Refill the differential to the correct level.

Differential Carrier

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely. Allow the rear axle assembly to hang freely. Remove the tire and wheel assemblies. Drain the lubricant.

2. Remove the differential cover. Remove the brake drum. Remove the axle shafts.

3. Mark one side of the carrier and matching cap for reassembly in the same position. Remove the bearing caps.

4. Using a spreader tool and a dial indicator gauge, spread the carrier assembly to a maximum of 0.015 in.

5. Remove the dial indicator tool. Use a prybar and remove the differential case from the carrier.

6. Record the dimension and location of the side bearing shims. Remove the spreader tool.

7. Installation is the reverse of the removal procedure.

Axle Housing

REMOVAL & INSTALLATION

Front

1. Raise and support the vehicle safely. Remove the wheel and tire assemblies.

2. Remove the bolt securing the steering stabilizer to the frame. Remove the idle arm retaining bolts.

3. Push the steering linkage toward the front of the vehicle. Remove the axle vent hose from the carrier fitting.

4. Disconnect the right halfshaft from the carrier. Disconnect the left hand halfshaft from the carrier by removing the retaining bolts. Keep the shaft from turning by inserting a drift through the opening in the top of the brake caliper into a corresponding vane of the brake rotor.

5. Disconnect the front driveshaft. Properly support the carrier assembly. Remove the carrier to frame retaining bolts.

6. Remove the differential carrier assembly from the vehicle.

7. Installation is the reverse of the removal procedure.

Rear

1. Raise and support the vehicle safely. Remove the tire and wheel assemblies. Properly support the rear axle assembly.

2. Disconnect the shock absorbers from the anchor plate. Matchmark the driveshaft and the pinion flange. Remove the driveshaft and support it aside.

3. Remove the brake line junction block from the axle housing. Disconnect and cap the brake lines at the junction block.

4. Remove the U bolts and anchor plates. Lower the axle assembly and remove the lower spring shackle bolts.

5. Disconnect the brake lines from the axle housing clips. Remove the backing plates.

6. Disconnect the lower control

arms from the axle housing. Remove the axle housing from the vehicle.

7. Installation is the reverse of the removal procedure. Fill and bleed the brake system.

STEERING

Steering Wheel

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the horn pad retaining screws. Remove the horn pad and disconnect the electrical lead.

3. Matchmark the steering wheel and the shaft.

4. Remove the steering wheel retaining nut.

5. Remove the steering wheel, using a suitable puller.

6. Installation is the reverse of removal. Align the matchmarks made during removal and tighten the steering wheel retaining nut to 30 ft. lbs. (40 Nm).

Manual Steering Gear

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Raise and support the vehicle safely. Position the wheels in the straight position. Be sure that the steering wheel is in the right position.

2. If equipped, remove the steering gear coupling shield. Remove the steering gear coupling bolt. On some vehicles it may be necessary to separate the coupling at the 2 flange bolts.

Steering wheel removal

Steering gear mounting — Pick-Up, Blazer, Jimmy, Astro and Safari

3. Matchmark the pitman arm to the steering gear. Remove the pitman arm retaining nut and washer. Using the proper tool, separate the pitman arm from the steering gear assembly.

4. Remove the steering gear retaining bolts. Remove the steering gear from the vehicle.

To install:

5. Install the steering gear in position in the vehicle.

6. Install the mounting bolts. Tighten the mounting bolts to 55 ft. lbs.

7. Connect the steering gear coupling at the flange bolts.

8. Connect the pitman arm to the steering gear. Tighten the pitman arm retaining bolt to 185 ft. lbs. (250 Nm).

9. Install the coupling shield. Lower the vehicle

10. Connect the negative battery cable.

ADJUSTMENT

1. Raise and safely support the vehicle.

2. Remove the coupling shield. Remove the pitman arm nut and washer.

3. Matchmark the pitman arm to the pitman shaft.

4. Remove the pitman arm, using a suitable puller.

5. Loosen the adjuster nut on the steering gear, then back out the adjuster 1/4 turn.

6. Lower the vehicle, keeping it just above the ground.

7. Remove the horn pad. Check the thrust bearing preload as follows:

a. Tighten the adjuster plug until the proper preload is achieved, 5–8 inch lbs. (0.6–1.0 Nm).

b. Tighten the adjuster nut to 85 ft. lbs.

c. Turn the steering wheel to check the adjustment. The gear should turn smoothly with no stops, from lock to lock.

8. To check the overcenter preload:

a. Turn the steering wheel from lock to lock counting the total number of turns.

b. Turn the wheel back to exactly the 1/2 way point.

c. Turn the over center adjuster screw clockwise, to take out all of the lash between the ball nut and the pitman shaft sector teeth and jam nut.

d. Tighten the jam nut to 22 ft. lbs. (30 Nm).

e. Check the torque at the steering wheel, taking the highest reading as the wheel is turned.

f. Tighten the adjuster plug to 4–10 inch lbs. (0.5–1.2 Nm).

To install:

9. Install the pitman arm onto the pitman shaft, aligning the matchmarks made during disassembly.

10. Install the pitman arm washer and nut. Install the coupling shield.

11. Lower the vehicle completely and install the horn pad.

12. Connect the negative battery cable.

Power Steering Gear

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Raise and support the vehicle safely. Position the wheels in the straight position.

2. Disconnect and cap the fluid lines.

3. If equipped, remove the steering gear coupling shield. Remove the steering gear coupling bolt. On some vehicles it may be necessary to separate the coupling at the 2 flange bolts.

4. Matchmark the pitman arm to the steering gear. Remove the pitman arm retaining nut and washer. Using the proper tool, separate the pitman arm from the steering gear assembly.

5. Remove the steering gear retaining bolts. Remove the steering gear from the vehicle.

To install:

6. Install the steering gear in position in the vehicle.

7. Install the mounting bolts. Tighten the mounting bolts to 55 ft. lbs.

8. Connect the steering gear coupling at the flange bolts.

9. Connect the pitman arm to the steering gear. Tighten the pitman arm retaining bolt to 185 ft. lbs. (250 Nm).

10. Connect the fluid lines. Install the coupling shield. Lower the vehicle.

11. Connect the negative battery cable. Fill and bleed the power steering system.

WORM BEARING PRELOAD ADJUSTMENT

1. With the steering gear removed from the vehicle, remove the adjuster plug nut.

2. Turn the adjuster plug in until it bottoms. Tighten the adjuster plug to 20 ft. lbs. (27 Nm).

3. Place an index mark on the housing, even with one of the holes in the adjuster plug.

4. Measure 13mm counterclockwise from the index mark and put a second mark on the housing.

5. Rotate the adjuster plug counterclockwise, until the hole in the plug is aligned with the second mark.

6. Install the adjuster plug nut (be sure the adjuster does not turn with the nut).

Power Steering Rack and Pinion

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the air cleaner assembly.

3. Remove the dust boot from the steering gear.

4. Remove the intermediate shaft lower pinch bolt and disconnect the intermediate shaft from the lower stub shaft.

5. Remove the fluid line retaining clips at the pump and disconnect the lines.

6. Raise and safely support the vehicle.

7. Remove the wheel and tire assemblies. Disconnect the tie rod ends at the steering knuckle.

8. Remove the remaining brackets and clips at the crossmember. Support the body safely with the appropriate equipment, to allow lowering of the subframe.

9. Remove the rear subframe mounting bolts and carefully lower the rear of the subframe approximately 5 in.

10. Remove the rack and pinion mounting bolts and remove the rack through the left wheel opening.

To install:

11. Install the rack and pinion through the left wheel opening.

12. Install the rack and pinion mounting nuts, tighten to 70 ft. lbs. (95 Nm).

13. Raise the subframe assembly and install the rear mounting bolts.

14. Remove any supports and install the brackets and clips to the crossmember.

15. Install the wheel and tire assemblies. Lower the vehicle.

16. Connect the fluid lines at the pump and tighten to 18 ft. lbs. (25 Nm).

17. Install the line retaining clips. Connect the intermediate shaft to the stub shaft.

18. Install the dust boot over the steering gear.

19. Install the air cleaner assembly and connect the negative battery cable.

20. Fill and bleed the steering system.

Power Steering Pump

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Disconnect and cap the power steering pump hoses. Remove the accessory drive belt.

2. Remove the power steering pump pulley using a suitable puller tool or equivalent.

3. Remove the pump mounting bolts. Remove the pump from the vehicle.

4. Installation is the reverse of the removal procedure. Tighten the pump

mounting bolts to 20 ft. lbs (27 Nm) on the 2.5L engine, 36 ft. lbs. (50 Nm) on the 2.8L, 3.1L and 4.3L engine. Bleed the power steering system.

SYSTEM BLEEDING

1. Fill the fluid reservoir to the proper level.

2. Start the engine and let it run for at least 2 minutes. Turn the engine off.

3. Add fluid if necessary, then run the engine again. Repeat this until the fluid level remains constant.

4. Raise the front of the vehicle slightly, until the front wheels are just off the ground.

5. Start the engine and slowly turn the steering wheel from lock to lock, until the wheel contacts the stop.

6. Add fluid if necessary. Lower the vehicle to the ground.

7. Start the engine and again move the wheels side to side. Check the fluid level.

Tie Rod Ends

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely. Remove the tire and wheel assemblies.

2. Remove the cotter pins and nuts. Using the proper removal tool, separate the outer tie rod from the steering knuckle.

3. Disconnect the inner tie rod from the relay rod using the proper tool. Remove the tie rod ends from the adjuster tubes.

4. Installation is the reverse of the removal procedure. Tighten the inner tie rod ball stud nut to 35 ft. lbs. (47 Nm). Tighten the outer tie rod ball stud to the steering knuckle to 35 ft. lbs. (47 Nm). The number of threads on both the inner and outer tie rod ends must be equal within 3 threads.

5. Adjust the front end alignment, as required.

BRAKES

For all brake system repair and service procedures not detailed below, please refer to "Brakes" in the Unit Repair section.

Master Cylinder

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Disconnect the electrical connections from the master cylinder. Disconnect and plug the fluid lines.

NOTE: On Lumina APV, Silhouette and Trans Sport, the master cylinder reservoir can be removed to ease master cylinder removal.

3. Remove the master cylinder to power booster retaining bolts. Remove the RWAL control module assembly, if equipped with anti-lock brakes.

3. Remove the master cylinder from the vehicle. Remove the vacuum booster pushrod.

4. Install the master cylinder in position on the booster. Connect the booster pushrod.

5. Install the master cylinder retaining bolts and tighten to 20 ft. lbs. (27 Nm).

6. Connect the fluid lines to the master cylinder. Connect the RWAL control unit, if equipped with anti-lock brakes, to the bracket.

7. Connect the negative battery cable. Refill the master cylinder and bleed the brake system.

Combination Valve

REMOVAL & INSTALLATION

Pick-Up, Blazer, Jimmy, Astro and Safari

The combination valve is mounted on the master cylinder bracket. On vehicles with anti-lock brakes, the combination valve is replaced with a dump/isolation valve. It is removed in the same manner.

1. Disconnect the negative battery cable.

2. Disconnect the brake lines from the combination valve.

3. Remove the mounting bolts and remove the valve from the bracket.

4. Installation is the reverse of the removal procedure. Bleed the brake system.

Proportioning Valve

REMOVAL & INSTALLATION

Lumina APV, Silhouette and Trans Sport

1. Disconnect the negative battery cable.

2. Remove the electrical connector from the master cylinder.

3. Drain and remove the master cylinder reservoir.

4. Remove the proportioning valve caps from the master cylinder.

5. Remove the O-rings, springs and

the valve pistons. Use care not to scratch the valves in any way.

6. Remove the valve seals from the valve pistons.

To install:

7. Install new seals on the valve pistons. Lubricate the seals and the pistons with silicon grease.

8. Install the valve pistons and O-rings into the master cylinder.

9. Install the valve cap assemblies and tighten to 20 ft. lbs. (27 Nm).

10. Install the reservoir assembly. Connect the electrical leads.

11. Connect the negative battery cable. Bleed the brake system.

Power Brake Booster REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Do not disconnect the master cylinder fluid lines, unless there is a clearance problem. Remove the master cylinder and position it to the side.

2. Remove the vacuum booster pushrod. Disconnect the vacuum hose from the booster assembly.

3. From inside the vehicle, remove the mounting studs which secure the vacuum booster to the fire wall.

4. Pull the booster away from the cowl and remove it from the vehicle.

5. Installation is the reverse of the removal procedure. Be sure to properly install the vacuum booster pushrod. Bleed the system.

Brake Caliper

REMOVAL & INSTALLATION

1. Remove $\frac{2}{3}$ of the brake fluid from the master cylinder reservoir.

1. Bolt boot
2. Mounting bolt and sleeve
3. Bushing
5. Outboard shoe and lining
6. Wear sensor
7. Inboard shoe and lining
8. Boot
9. Piston
10. Piston seal
11. Bleeder valve
12. Caliper housing

Brake caliper—exploded view

2. Raise and support the vehicle safely. Remove the tire and wheel assembly.

3. Disconnect and plug the caliper fluid line. Remove the bolts retaining the caliper to the rotor. Remove the caliper from the rotor.

NOTE: If the caliper is being removed for brake pad replacement, the fluid line do not need to be disconnected.

4. Remove the disc brake pads from the caliper. Remove the disc brake pad retaining clips from inside the caliper.

To install:

5. Fill both of the cavities in the caliper housing between the bushings with silicon grease. Install the pads in the caliper.

6. Install the caliper in position over the rotor and install the mounting bolts. Tighten the mounting bolts to 38 ft. lbs. (51 Nm).

7. Connect the fluid lines to the caliper, if disconnected, and tighten to 33 ft. lbs. (45 Nm).

8. Install the wheel and tire assembly.

9. Lower the vehicle and refill the master cylinder to the correct level. Bleed the brake system if the fluid lines were disconnected from the caliper.

Disc Brake Pads

REMOVAL & INSTALLATION

1. Remove $\frac{2}{3}$ of the brake fluid from the master cylinder.

2. Raise and safely support the vehicle.

3. Remove the brake caliper.

4. Remove the inboard pad and retaining spring from the caliper.
5. Remove the outboard pad and retaining spring from the caliper.
6. Remove the sleeves and bushings.

To install:

7. Lubricate the sleeves and bushing with silicon lubricant and install them in the caliper.
8. Clip the retaining sprig onto the inboard pad and install the pad in the caliper.
9. Install the outboard pad into the caliper.
10. Install the caliper in position over the rotor and install the mounting bolts. Bend the tabs, on the brake pads, over the caliper.
11. Install the wheel and tire assemblies.
12. Lower the vehicle and refill the master cylinder to the correct level.

Brake Rotor

REMOVAL & INSTALLATION

Pick-Up, Blazer, Jimmy, Astro and Safari

2WD VEHICLES

1. Remove $\frac{2}{3}$ of the brake fluid from the master cylinder.
2. Raise and support the vehicle safely. Remove the tire and wheel assembly.
3. Remove the bolts retaining the caliper to the rotor. Remove the caliper from the rotor and position it to the side. Do not allow the caliper to hang unsupported.
4. Remove the dust cap, cotter pin, spindle nut, washer and outer wheel bearings.
5. Remove the rotor from the vehicle. On Astro and Safari with 4 wheel anti-lock brakes, remove the wheel speed sensor from behind the rotor.
5. Installation is the reverse of the removal procedure. Adjust the wheel bearings, as required.
6. Bleed the system. Start the vehicle and depress the brake pedal slowly, a few times, to seat the disc brakes on the rotor.

4WD VEHICLES

1. Remove $\frac{2}{3}$ of the brake fluid from the master cylinder.
 2. Raise and safely support the vehicle.
 3. Remove the wheel and tire assemblies.
 4. Remove the brake caliper from the rotor and support it aside. Do not disconnect the brake lines.
 5. Remove the rotor from the hub.
- To install:**
6. Install the rotor on the hub. Install the brake caliper.

7. Install the wheel and tire assemblies.

8. Lower the vehicle and refill the master cylinder.

Lumina APV, Silhouette and Trans Sport

1. Remove $\frac{2}{3}$ of the brake fluid from the master cylinder. Raise and safely support the vehicle.
 2. Remove the wheel and tire assemblies.
 3. Remove the brake caliper from the rotor and support it aside. Do not disconnect the brake lines.
 4. Remove the rotor from the hub.
- To install:**
5. Install the rotor on the hub. Install the brake caliper.
 6. Install the wheel and tire assemblies.
 7. Lower the vehicle and refill the master cylinder.

Brake Drums

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.
2. Remove the wheel and tire assembly.
3. Remove the brake drum from the vehicle. If the drum will not pull off of the axle, use a rubber mallet and tap it around the edge.
4. Install the drum on the axle and install the wheel and tire assembly.
5. Lower the vehicle.

Brake Shoes

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.
2. Remove the wheel and tire assembly.
3. Remove the brake drum.
4. Remove the return springs from the brake shoes. Remove the shoe guide.
5. Remove the hold-down springs and pins. Remove the actuator lever and pivot.
6. Remove the lever return spring. Remove the actuator link.
7. Remove the parking brake strut and spring.
8. Remove the brake shoes and the adjuster assembly.

To install:

9. Lubricate the shoe pads and the adjuster with lithium grease.
10. Install the adjusting screw and spring assembly.
11. Install the shoe assembly onto the backing plate.
12. Install the parking brake lever, strut and strut spring.
13. Install the actuator lever and lever pivot. Install the actuator link.
14. Install the lever spring, the hold-down pins and springs.
15. Install the shoe guide. Install the return springs and install the brake drum in position.
16. Install the wheel and tire assemblies. Check the adjustment of the

Drum brake assembly — exploded view

brakes. The brakes should drag just slightly.

17. If the wheel will not turn loosen the adjuster slightly.

Wheel Cylinder

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.

2. Remove the wheel and tire assemblies.

3. Remove the brake drum and remove the brake shoes.

4. Disconnect the brake fluid line from the wheel cylinder.

5. Remove the wheel cylinder retaining bolt.

6. Remove the wheel cylinder from the backing plate.

To install:

7. Install the wheel cylinder in position on the backing plate.

8. Install the retaining bolt. Connect the brake line to the wheel cylinder.

9. Install the brake linings and the brake drum.

10. Install the wheel and tire assembly. Lower the vehicle.

11. Bleed the brake system.

Parking Brake Cable

REMOVAL & INSTALLATION

Rear

1. Raise and support the vehicle safely. Remove the tire and wheel assembly. Remove the brake drum.

2. Loosen the equalizer and disconnect the cable at the center retainer.

3. Compress the plastic retainer fingers and remove the retainer from the frame bracket.

4. Remove the rear brake shoe assembly. Disconnect the parking brake cable. Remove the cable from the frame and from the brake backing plate.

5. Installation is the reverse of the removal procedure. Adjust the rear brakes, as required. Adjust the parking brake.

Front

1. Raise and support the vehicle safely. Loosen the adjuster nut and disconnect the front cable from the connector.

2. Compress the retainer fingers and loosen the assembly at the frame. Remove the supports.

3. Lower the vehicle. As required, remove dash trim panels to gain access to the parking brake pedal assembly.

4. Disconnect the cable from the

Parking brake cable routing—Pick-Up, Blazer, Jimmy, Astro and Safari

parking brake pedal, compress the retainer fingers. Remove the cable from the vehicle.

5. Installation is the reverse of the removal procedure. Adjust the parking brake.

ADJUSTMENT

1. Raise and support the vehicle safely. Loosen the equalizer nut. Some vehicles may require the removal of the cable guide on the equalizer.

2. Set the parking brake pedal 2 clicks (2WD vehicles) and 3 clicks (4WD vehicles).

3. Tighten the equalizer nut until the rear wheels will not rotate without excessive force in the forward motion.

4. Back off the equalizer nut until there is light drag when the wheels are rotated in the forward motion.

5. If removed, install the cable guide. Release the parking brake.

6. Rotate the rear wheels in the forward motion. There should be no brake drag.

FRONT SUSPENSION

Shock Absorbers

REMOVAL & INSTALLATION

1. Remove the top shock mounting nut and grommet.

2. Raise and safely support the vehicle.

3. Remove the wheel and tire assembly.

4. Remove the lower shock mounting bolts and remove the shock absorber.

5. Installation is the reverse of the removal procedure. Tighten the upper shock mounting nut on 2WD vehicles to 8 ft. lbs. (11 Nm) and the lower bolts to 20 ft. lbs. (27 Nm). On 4WD vehicles tighten the mounting bolts to 54 ft. lbs. (73 Nm).

Strut assembly mounting—Lumina APV, Silhouette and Trans Sport

MacPherson Strut

REMOVAL & INSTALLATION

Lumina APV, Silhouette and Trans Sport

1. Remove the 3 nuts that retain the top of the strut assembly.
2. Raise and safely support the vehicle.
3. Remove the wheel and tire assembly. Remove the brake line bracket from the strut mount.
4. Remove the lower strut mounting bolts.
5. Remove the strut from the vehicle.
6. Installation is the reverse of the removal procedure. Tighten the strut lower bolts to 140 ft. lbs. (190 Nm) and the upper mounting nuts to 18 ft. lbs. (25 Nm).

Coil Springs

REMOVAL & INSTALLATION

Pick-Up, Blazer, Jimmy, Astro and Safari

2WD VEHICLES

1. Raise and support the vehicle safely. Remove the wheel and tire assembly. Remove the shock absorber lower retaining bolts.
2. Push the shock absorber through the control arm and into the spring.
3. With the vehicle supported so that the control arms hang free, install tool J-23028 or equivalent. Secure the tool using a suitable jack. Remove the stabilizer bar from the control arm.
4. Remove the stabilizer to lower control arm attachment. Raise the jack and remove the tension on the lower control arm bolts.

5. Install a safety chain around the spring and through the lower control arm. Remove the lower control arm rear bolt, then remove the other retaining bolt.

6. Lower the jack and allow the lower control arm to hang free. Remove the spring assembly from the vehicle.

7. Installation is the reverse of the removal procedure. When positioning the spring in the lower control arm, be sure that the spring insulator is in the proper position before lifting the control arm in place.

8. Check the front end alignment when complete.

Torsion Bars and Support

REMOVAL & INSTALLATION

Pick-Up, Blazer, Jimmy, Astro and Safari

4WD VEHICLES

1. Raise and safely support the vehicle. Remove the wheel and tire assemblies.

2. Remove the torsion bar adjusting bolt using tool J-36202 or equivalent. Count the number of tool turns required to remove the bolt.

3. Remove the torsion bar support retainer plate and insulator.

4. Remove the torsion bar by sliding it forward into the control arm and lowering it from the vehicle.

5. Remove the torsion bar support from the vehicle. Remove the adjusting arm and the adjusting arm bolt.

To install:

6. Install the adjusting arm to the support and loosely install the adjusting bolt.

7. Install the support to the frame and the insulator to the frame end.

8. Install the retainer to the support. Install the retainer mounting bolts and tighten to 26 ft. lbs. (35 Nm).

9. Tighten the center retainer bolt to 25 ft. lbs. (34 Nm).

10. Install the torsion bar to the lower control arm and raise and slide the torsion bar into the adjusting arm. The torsion bar should have 6mm clearance at the support.

11. Attach tool J-36202 to the support and tighten it against the adjusting arm the recorded number of turns.

12. Install the adjusting bolt and turn it in until it contacts the adjusting arm. Remove the tool.

13. Install the wheel and tire assemblies. Lower the vehicle.

Upper Ball Joint

INSPECTION

1. Raise and safely support the vehicle slightly.

2. Wipe the ball joint clean and check the seal for cuts or tears.

3. Check the wheel bearings for proper adjustment.

4. Position a dial indicator against the outside point of the wheel. Rock the wheel in and out.

5. Check the reading on the dial indicator. The reading should be no more than 3.18 mm.

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely. Properly support the lower control arm.

NOTE: The control arm must be supported so that the spring and the control arm remain intact.

2. Remove the tire and wheel assembly. As required, remove the brake caliper and position it to the side.

3. Remove the cotter pin and the upper ball joint retaining bolt. Using the proper tool separate the upper joint from its mounting. Support the knuckle assembly so that its weight will not damage the brake hose.

4. Remove the rivets from the ball joint assembly, using a drill with a 1/8 in. bit. Remove the ball joint from the upper control arm.

5. Installation is the reverse of the removal procedure. Be sure to use the nuts and bolts that are supplied with the replacement ball joint assembly. Tighten the replacement bolts to 17 ft. lbs. (23 Nm). Check and adjust the front end alignment, as required.

Torsion bar spring mounting—4WD Pick-Up, Blazer, Jimmy, Astro and Safari

Lower Ball Joint

INSPECTION

1. Raise and safely support the vehicle.
2. The ball joint wear is indicated by the position of the grease fitting on the bottom of the joint.
3. The round portion of the grease nipple must protrude from the bottom of the joint. If the nipple is flush with or inside of the joint, it must be replaced.

REMOVAL & INSTALLATION

1. Raise and support the vehicle safely. Properly support the lower control arm.

NOTE: The control arm must be supported so that the spring and the control arm remain intact.

2. Remove the tire and wheel assembly. As required, remove the brake caliper and position it to the side.

3. Remove the cotter pin and the lower ball joint retaining bolt. Using the proper tool separate the ball joint from its mounting. Support the knuckle assembly so that its weight will not damage the brake hose.

4. Remove the rivets from the ball joint assembly, using a drill with a $\frac{1}{8}$ in. bit. Remove the ball joint from the control arm.

5. Installation is the reverse of the removal procedure. Be sure to use the nuts and bolts that are supplied with the replacement ball joint assembly. Tighten the replacement bolts to 17 ft. lbs. (23 Nm). Check and adjust the front end alignment, as required.

Front suspension components—2WD Pick-Up, Blazer, Jimmy, Astro and Safari

5. Installation is the reverse of the removal procedure. Tighten the upper control arm nuts to 65 ft. lbs. (88 Nm). Check and adjust the front end alignment, as required.

Lumina APV, Silhouette and Trans Sport

1. Raise and safely support the vehicle so that the suspension hangs freely.

2. Remove the wheel and tire assemblies.

3. Remove the stabilizer shaft-to-control arm mounting bolt. Remove the lower ball joint pinch bolt.

4. Separate the steering knuckle from the lower ball joint.

5. Remove the lower control arm mounting bolts and remove the control arm from the vehicle.

To install:

6. Install the control arm in position on the vehicle frame. Do not tighten the control arm bolts at this time.

7. Install the stabilizer shaft to the control arm, do not tighten the bolts at this time.

8. Connect the steering knuckle to the control arm using a new pinch bolt. Tighten to 33 ft. lbs. (45 Nm). Lower the vehicle so that the weight is supported by the control arms.

9. Tighten the control arm bolts to 61 ft. lbs. (83 Nm). Tighten the stabilizer shaft bolts to 32 ft. lbs. (43 Nm).

Upper Control Arms

REMOVAL & INSTALLATION

1. Note and record the amount of shims used at the control arm retaining bolts. These shims must be installed in the same location as removed. Remove the nuts and the shims.

2. Raise and support the vehicle safely. Properly support the lower control arm. The control arm must be supported so that the spring and the control arm remain intact.

3. Remove the wheel and tire assembly. Loosen the upper ball joint from the steering knuckle, using the proper tool. Support the hub assembly.

4. Remove the upper control arm retaining bolts. Remove the upper control arm from the vehicle.

Lower Control Arms

REMOVAL & INSTALLATION

Pick-Up, Blazer, Jimmy, Astro and Safari

2WD VEHICLES

1. Raise and support the vehicle safely.

2. Remove the wheel and tire assemblies. Properly support the lower control arm assembly.

3. Remove the coil spring.

4. Remove the lower ball joint cotter pin and retaining nut.

5. Using the proper tool, separate the lower ball joint from the steering knuckle.

6. Remove the lower control arm from the vehicle.

7. Installation is the reverse of the removal procedure. Check and adjust front alignment, as required.

10. Install the wheel and tire assemblies. Lower the vehicle completely.

Stabilizer Shaft

REMOVAL & INSTALLATION

1. Raise and safely support the vehicle.
2. Remove the wheel and tire assembly.
3. Remove the left and right side stabilizer mounting bolts. Keep the sides separate for installation.
4. Remove the center stabilizer insulators and lower the stabilizer from the vehicle.
5. Install the stabilizer in position in the vehicle. Tighten the left and right mounting bolts to 24 ft. lbs. and the center bushing supports to 35 ft. lbs.
6. Install the wheel and tire assemblies and lower the vehicle.

Stabilizer bar mounting—Pick-Up, Blazer, Jimmy, Astro and Safari

Front Wheel Bearings

REMOVAL & INSTALLATION

2WD Pick-Up, Blazer, Jimmy, Astro and Safari

1. Raise and support the vehicle safely. Remove the tire and wheel assembly.
2. Remove the brake caliper and position it to the side. Remove the dust cover, cotter pin, washer and spindle nut.
3. Remove the outer wheel bearing assembly. Remove the brake rotor. Remove the inner wheel bearing assembly.
4. Installation is the reverse of the removal procedure. When installing new bearings, be sure to install new bearing races inside the rotor.
5. Pack new bearings with the proper grade and type wheel bearing grease. Adjust the wheel bearings.

ADJUSTMENT

1. Raise and safely support the vehicle.
2. Remove the brake caliper and the dust cap from the wheel hub.
3. Remove the cotter pin from the castle nut.
4. Tighten the castle nut to 12 ft. lbs. (16 Nm) while turning the rotor forward.
5. Loosen the castle nut, then tighten it, by hand to a just loose position.
6. Back the nut off slightly, until the hole in the spindle aligns with a slot in the nut. Do not back the nut off more than 1/2 of a flat.

7. Install a new cotter pin. Measure the rotor endplay at the castle nut, it should not exceed 0.0005 in. (0.13mm).
8. Install the bearing dust cover and install the wheel and tire assembly.
9. Lower the vehicle.

REAR SUSPENSION

Shock Absorbers

REMOVAL & INSTALLATION

Pick-Up, Blazer, Jimmy, Astro and Safari

1. Raise and support the vehicle safely.
2. Properly support the rear axle assembly.
3. Remove the upper shock absorber retaining bolt.
4. Remove the lower shock absorber bolt.
5. Remove the shock absorber from the vehicle.
6. Install the shock in position and install the mounting bolts.
7. Tighten the top mounting bolts to 17 ft. lbs. (23 Nm) and the lower mounting bolts to 47 ft. lbs. (64 Nm).
8. Lower the vehicle.

Lumina APV, Silhouette and Trans Sport

1. Open the lift gate and open the trim cover.

2. Remove the upper shock mounting nut and grommet.

3. Raise and safely support the vehicle. Properly support the rear axle assembly.

4. If equipped with electronic level control suspension, remove the air line from the shock absorber. Allow the air to bleed off.

5. Remove the lower mounting bolt and remove the shock from the vehicle.

6. Install the shock in position and install the lower mounting bolt. Tighten to 44 ft. lbs. (59 Nm). Connect the air line to the shock, if equipped.

7. Lower the vehicle and install the upper shock retaining nut, tighten it to 16 ft. lbs. (22 Nm). Install the trim cover.

Coil Springs

REMOVAL & Installation

Lumina APV, Silhouette and Trans Sport

1. Raise and safely support the vehicle.
2. Safely support the rear axle assembly.
3. Remove the right and left brake line-to-axle attaching screws. Allow the brake lines to hang freely.
4. Disconnect the track bar-to-axle attaching bolt.
5. Disconnect the lower shock absorber mounting bolts.
6. Slowly lower the rear axle and remove the springs and insulators.
7. Installation is the reverse of the removal procedure. Make sure the springs are fully seated in the pads.

Leaf Springs

REMOVAL & INSTALLATION

Pick-Up, Blazer, Jimmy, Astro and Safari

1. Raise and support the vehicle safely. Properly support the rear axle assembly to relieve tension on the springs.
2. Remove the shock absorbers. Remove the U bolt nuts, washers, anchor plates and the U bolts.
3. Remove the shackle to frame bolt, washers and nut. Remove the spring assembly to front bracket nut, washers and bolt.
4. Remove the spring assembly from the vehicle. As required, separate the spring from the shackle.
5. Installation is the reverse of the removal procedure. Tighten the U bolts to 85 ft. lbs. (115 Nm) in 2 gradual steps. Tighten the front and rear shackle nuts to 92 ft. lbs. (125 Nm).

Rear Wheel Hub and Bearing Assembly

REMOVAL & INSTALLATION

Lumina APV, Silhouette and Trans Sport

1. Raise and safely support the vehicle.
2. Remove the wheel and tire assemblies.
3. Remove the brake drum.
4. Remove the hub and bearing assembly mounting bolts and remove it from the vehicle. Support the brake assembly with a wire.
5. Installation is the reverse of the removal procedure. Tighten the hub assembly mounting bolts to 45 ft. lbs. (60 Nm).

Track Bar

REMOVAL & INSTALLATION

Lumina APV, Silhouette and Trans Sport

1. Raise and safely support the vehicle.
2. Remove the track bar mounting bolts from the body and the axle.
3. Lower the track bar from the vehicle.
4. Install the track bar at the axle, loosely install the bolt.
5. Connect the other end of the track bar at the frame.
6. Tighten the bolt at the axle to 44 ft. lbs. (60 Nm). and the track bar-to-frame bolt to 35 ft. lbs. (47 Nm).
7. Lower the vehicle.

Rear track bar mounting – Lumina APV, Silhouette and Trans Sport

Rear axle assembly mounting – Lumina APV, Silhouette and Trans Sport

Rear Axle Assembly

REMOVAL & INSTALLATION

Lumina APV, Silhouette and Trans Sport

1. Raise and safely support the vehicle.
2. Properly support the rear axle assembly.
3. Remove the wheel and tire assemblies. Remove the brake drums.
4. Disconnect the parking brake cable from the brake system.
5. Disconnect the brake line brackets from the axle assembly.

6. Disconnect the shock absorbers from the axle.

7. Disconnect the track bar bolt at the rear axle.

8. Lower the rear axle slightly and remove the coil springs and insulator.

9. Remove the hub and bearing assemblies, support the backing plate and brake assemblies with wire from the vehicle.

NOTE: Do not allow the backing plates to hang by the brake lines.

10. Remove the control arm to frame bracket attaching bolts and lower the axle assembly from the vehicle.

6 GENERAL MOTORS MID SIZE ASTRO/SAFARI • BLAZER/JIMMY • LUMINA APV

To install:

11. Raise the axle assembly to the vehicle and install the control arm bolts. Torque control arm bracket bolts to 84 ft. lbs. (115 Nm). Torque the control arm to bracket pivot bolts to 28 ft. lbs. (38 Nm).

12. Install the backing plate, hub and

bearing assembly. Use care not to kink the brake lines.

13. Install the brake line brackets to the axle assembly. Connect the parking brake cable to the brake assembly.

14. Position the coil springs and insulators on the axle and raise the axle.

15. Connect the shock absorber lower bolts to the axle.

16. Connect the track bar to the rear axle.

17. Install the brake drums. Install the wheel and tire assemblies.

18. Lower the vehicle.

VEHICLE IDENTIFICATION CHART

It is important for servicing and ordering parts to be certain of the vehicle and engine identification. The VIN (vehicle identification number) is a 17 digit number visible through the windshield on the driver's side of the dash and contains the vehicle and engine identification codes. The tenth digit indicates model year and the fourth digit indicates engine code. It can be interpreted as follows:

Engine Code					
Code	Cu. In.	Liters	Cyl.	Fuel Sys.	Eng. Mfg.
B	126	2.1	4	Diesel	Renault
U	150	2.5	4	1bbl	AMC
H	150	2.5	4	TBI	AMC
W	173	2.8	6	2bbl	Chevrolet
M	243	4.0	6	MFI	Chrysler
C	258	4.2	6	2bbl	AMC
N	360	5.9	8	2bbl	AMC

Model Year

① Aisin Warner Transmission—7.4 pts.

② 1986-88 Cherokee, Comanche, Wrangler and Wagoneer had an optional 20 gallon fuel tank.

FIRING ORDERS

NOTE: To avoid confusion, always replace spark plug wires one at a time.

2.5L 4 cylinder
Firing order: 1-3-4-2
Distributor rotation: clockwise

4.0L and 4.2L 6 cylinder
Firing order: 1-5-3-6-2-4
Distributor rotation: clockwise

5.9L V8
Firing order: 1-8-4-3-6-5-7-2
Distributor rotation: clockwise

2.8L V6
Firing order: 1-2-3-4-5-6
Distributor rotation: clockwise

ENGINE ELECTRICAL

NOTE: Disconnecting the battery cable on some vehicles may interfere with the functions of the on board computer systems and may require the computer to undergo a relearning process, once the negative battery cable is disconnected.

Distributor

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the electric cooling fan and shroud assembly, if equipped.
3. Scribe a mark on the distributor housing, below the left side of the No. 1 spark plug wire post on the distributor cap.
4. Remove the distributor cap. Turn the engine until the rotor points in the direction of the scribed mark.
5. Turn the engine until the timing mark on the damper aligns with the 0 on the timing scale.
6. Align the trailing edge of the rotor blade with the mark scribed on the distributor housing.
7. Remove the distributor hold down bolt and clamp. Remove the distributor.

To install:

8. If the engine has been turned while the distributor was removed, or if the marks were not drawn, it will be necessary to initially time the engine.
9. It is necessary to place the No. 1 cylinder in the firing position to correctly install the distributor.
10. Remove the No. 1 cylinder spark plug. Turn the engine until the piston

in No. 1 cylinder is moving up on the compression stroke. This can be determined by placing a thumb over the spark plug hole and feeling the air being forced out of the cylinder.

11. Install the distributor, when the distributor shaft has reached the bottom of the hole, move the rotor back and forth slightly until the drive gears of the distributor and cam mesh and until the distributor assembly slides down into place.

12. Install the distributor hold down bolt and tighten to 9.5-14 ft. lbs. (13-19 Nm).

13. Install the cooling fan and shroud, if removed. Connect the negative battery cable.

Ignition Timing

ADJUSTMENT

NOTE: The ignition timing for the 4.0L engine is controlled by the ECU and is not adjustable.

2.5L, 2.8L, 4.2L and 5.9L Engines

1. Locate the timing marks on the crankshaft pulley and the front of the timing case cover.
2. Clean off the timing marks.
3. Use chalk or white paint to color the mark on the scale that will indicate the correct timing, when aligned with the mark on the pulley or the pointer.
4. Attach a tachometer to the engine.
5. Attach a timing light to the engine.
6. Disconnect and plug the vacuum lines to the distributor. Loosen the distributor lock bolt just enough so that the distributor can be turned with a little resistance.
7. Place the transmission in **P** and turn **OFF** all accessories.

Distributor rotor alignment for installation

Timing mark location - 4.2L engine

8. Start the engine and check the idle, if necessary adjust it to the correct specification.

9. With the timing light aimed at the pulley and the marks on the engine, turn the distributor in the direction of rotor rotation to retard the spark, and in the opposite direction of rotor rotation to advance the spark.

Timing mark location—5.9L engine

CRANKSHAFT VIBRATION DAMPER TIMING MARK

Timing mark location—4.0L engine

Align the marks on the pulley and the engine with the flashes of the timing light.

10. Tighten the hold-down bolt and recheck the timing.

Alternator

For further information on the charging system, please refer to "Charging and Starting" in the Unit Repair section.

BELT TENSION ADJUSTMENT

With V-Belts

The belt tension should be checked using the gauge method. The gauge should be placed in the section of belt being checked. The correct specifica-

Accessory drive belt routing—with V-belts, except 5.9L

Accessory drive belt routing—with serpentine belt

Accessory drive belt routing—5.9L engine with V-belts

tion for a new V-belt is 120–160 ft. lbs. (533–711 Nm) and the correct tension for a used V-belt is 90–115 ft. lbs. (400–511 Nm).

To adjust the belt tension:

1. On vehicles equipped with the 2.1L, 2.5L, 2.8L and 4.0L engines, loosen the power steering pump mounting bolts. On vehicles equipped with the 5.9L and 4.2L engines, loosen the alternator mounting bolts.

2. Pry the alternator (or power steering pump) away from the engine to tension the belt.

3. Tighten the mounting bolts to 20 ft. lbs. (27 Nm).

With Serpentine Belt

The belt tension should be checked using the gauge method. The gauge should be placed in the section of belt being checked. The correct specification for a new serpentine belt is 180–200 ft. lbs (800–900 Nm) and the correct tension for a used serpentine belt is 140–160 ft. lbs. (623–712 Nm).

To adjust the belt tension:

1. On vehicles equipped with the 2.5L and 4.0L engines, loosen the power steering pump mounting bolts. On vehicles equipped with the 4.2L and engines, loosen the alternator mounting bolts.

2. Tighten the adjusting bolt to increase the belt tension and loosen it to release the belt tension.

3. Tighten the mounting bolts to 20 ft. lbs. (27 Nm).

REMOVAL & INSTALLATION

Grand Wagoneer, J10 Pick-Up, J20 Pick-Up, CJ-7 and Wrangler

1. Disconnect the negative battery cable.

2. Loosen the pivot bolt and remove the accessory drive belt.

3. Remove the wire terminals attached to the rear of the alternator.

4. Loosen the bolt holding the adjusting bar and the pivot bolt at the opposite side of the alternator.

5. Remove the adjusting bar and pivot bolts and remove the alternator from the engine.

To install:

6. Attach the alternator to the mounting bracket and tighten the bolts finger tight.

7. Install the accessory drive belt.

8. Adjust the belt tension to specification.

9. Tighten the mounting bolts and connect the electrical leads.

10. Connect the negative battery cable.

Cherokee, Comanche and Wagoneer

1. Disconnect the negative battery cable.

2. Loosen the pivot bolt and remove the accessory drive belt.

3. Raise and safely support the vehicle.

4. Disconnect the electrical connector at the rear of the alternator.

5. Remove the alternator mounting bolts.

6. Remove the alternator from below the vehicle.

To install:

7. Attach the alternator to the mounting bracket and tighten the bolts to 28 ft. lbs. (38 Nm).

8. Connect the electrical leads and lower the vehicle.

9. Install the accessory drive belt.

10. Adjust the belt tension to specification.

11. Connect the negative battery cable.

Starter

For further information on the charging system, please refer to "Charging and Starting" in the Unit Repair section.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Raise and safely support the vehicle.

3. Disconnect the electrical leads from the starter.

4. Remove the starter mounting bolts and remove the starter from the vehicle.

To install:

5. Install the starter in position.

1. End housing bushing
2. Drive end housing
3. Spacer
4. Pad
5. Solenoid plate
6. Solenoid
7. Pinion shaft yoke
8. Support plate
9. Support plate bushing
10. Field winding and pole shoe sets

11. Pole shoe screw
12. Armature housing
13. Grommet
14. Brush set

15. Brush spring

19. Through bolts
20. Armature brake assembly
21. Armature
22. Starter drive pinion
23. Drive pinion stop
24. Shift yoke pivot pins
25. Shift yoke axle

Exploded view of the Paris-Rhone starter

6. Tighten the mounting bolts to 33 ft. lbs. (45 Nm).
7. Connect the electrical leads and lower the vehicle.

Diesel Glow Plugs

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Disconnect the wire from the glow plug.
3. Unscrew the glow plug from the cylinder head.
4. Installation is the reverse of removal. Use a small amount of anti-seize compound on the glow plug threads. Torque the glow plug to 20 ft. lbs.

TESTING

1. Remove the electrical lead from the glow plug.
2. Using a test light, connect the spring clip to the battery positive terminal. Touch the probe to each of the glow plugs.
3. If the light comes on, the glow plug is functioning. If the light does not come on, the glow plug is not working properly.

CHASSIS ELECTRICAL

Heater Blower Motor

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Remove the coolant overflow bottle.
 2. If equipped with anti-lock brakes, remove the anti-lock brake pump and bracket and position it out of the way.
 3. Remove the brake hose retaining bracket screw.
 4. Unplug the blower motor wiring connector.
 5. Remove the blower motor mounting screws and lift out the motor.
- To install:**
6. Install the blower motor into position and connect the electrical leads.
 7. Connect the brake hose retaining bracket.
 8. Install the anti-lock brake pump and bracket.
 9. Install the coolant bottle and connect the negative battery cable.

Windshield Wiper Motor

REMOVAL & INSTALLATION

CJ7 and Wrangler

1. Disconnect the negative battery cable. Remove the necessary hard or soft top components from the windshield frame.
2. Remove the left and right windshield holddown knobs and fold the windshield forward.
3. Remove the left access hole cover. Disconnect the drive link from the left wiper pivot. Disconnect the wiper motor harness from the switch.
4. Remove the wiper motor retaining screws. Remove the wiper motor from the vehicle.
5. Installation is the reverse of the removal procedure.

Grand Wagoneer, J10 Pick-Up and J20 Pick-Up

1. Disconnect the negative battery cable.
2. Remove the screws attaching the motor adapter plate to the dash panel.
3. Separate the wiper wiring harness connector at the wiper motor.
4. Pull the motor and the linkage out of the opening to expose the drive link to crank stud retaining clip.
5. Raise up the lock tab of the clip and slide the clip off of the stud.
6. Remove the wiper motor from the vehicle.
7. Installation is the reverse of the removal procedure.

Wagoneer, Cherokee and Comanche

1. Disconnect the negative battery cable.
2. Remove the wiper arm assemblies. Remove the cowl and trim panel.
3. Disconnect the washer hose. Remove the cowl mounting bracket attaching bolts and the pivot pin attaching screws.
4. Disconnect the wiring harness and remove the assembly. The motor is protected by a rubber case, care should be used as not to damage this protective coat.
5. Installation is the reverse of the removal procedure.

Windshield Wiper Switch

REMOVAL & INSTALLATION

Dash Mounted

1. Disconnect the negative battery cable. Remove the switch knob.

2. On CJ7 and Wrangler equipped with air conditioning, remove the retaining screws attaching the evaporator assembly to the instrument panel. Lower the evaporator assembly.

3. Remove the nut from the switch assembly. Push the switch rearward.

4. Disconnect the switch electrical connectors. Remove the switch from the vehicle.

5. Installation is the reverse of the removal procedure.

Instrument Cluster

REMOVAL & INSTALLATION

CJ7

1. Disconnect the negative battery cable.
2. Disconnect the speedometer cable from the back of the speedometer.
3. Remove the instrument cluster attaching screws and pull the cluster forward.
4. Disconnect the instrument cluster electrical connectors. Remove the cluster from the vehicle.
5. Installation is the reverse of the removal procedure.

Wrangler

1. Disconnect the negative battery cable.
2. Remove the dash panel trim plate.
3. Remove the speedometer assembly retaining screws.
4. Pull the speedometer forward. Disconnect the electrical connectors, as required. Disconnect the speedometer cable.
5. Remove the speedometer from the vehicle.
6. Installation is the reverse of the removal procedure.

Grand Wagoneer, J10 Pick-Up and J20 Pick-Up

1. Disconnect the negative battery. Remove the cluster retaining screws.
2. Disconnect the speedometer cable.
3. Disconnect the cluster terminal pin plug. Disconnect the four terminal connector.
4. Mark the electrical connectors and hoses, disconnect them and the blend door air cable.
5. Remove the heater control panel lamps. Disconnect the heater temperature control wire from the lever. Remove the cluster.
6. Installation is the reverse of the removal procedure.

1. Tell tale display
2. Lens
3. Gauge
4. Coolant temperature gauge
5. Fuel gauge
6. Tachometer
7. Tachometer module
8. Speedometer
9. Engine oil pressure gauge
10. Voltmeter/diesel boost gauge
11. Mounting bezel
12. PC overlay

Instrument cluster assembly—Comanche, Cherokee and Wagoneer

Wagoneer, Cherokee and Comanche

1. Disconnect the negative battery cable.
2. Remove the instrument panel bezel screws and lift off the bezel. The bezel unsnaps.
3. Remove the cigarette lighter housing screws.
4. Remove the rocker switch housing screws.
5. Remove the cluster screws.
6. Disconnect the speedometer cable, pull the cluster out slowly and disconnect the electrical connectors at the cluster back. Remove the cluster.
7. Installation is the reverse of the removal procedure.

Speedometer

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the instrument cluster.
3. Remove the 2 attaching screws from the rear of the cluster.

4. Remove the screw from the front of the speedometer and pull it from the cluster. Pull the speedometer out of the circuit board carefully.
5. Install the speedometer in the reverse order of the removal procedure.

Radio

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.
2. Remove the instrument panel bezel.
3. Remove the radio attaching screws.
4. Disconnect the radio from the instrument panel wiring harness.
5. Installation is the reverse of removal.

Headlight Switch

REMOVAL & INSTALLATION

Pullout Type Switch

1. Disconnect the negative battery cable.

2. Pull the light switch control knob out as far as it will go. As required, remove the instrument panel trim plate.

3. From under the dash depress the headlight switch shaft retainer button. Pull the shaft along with the knob from the headlight switch assembly.

4. Remove the headlight switch retaining nut. Disconnect the electrical connector from the switch.

5. Remove the headlight switch from the vehicle.

6. Installation is the reverse of the removal procedure.

Rocker Type Switch

1. Disconnect the negative battery cable.

2. Remove the instrument cluster shroud.

3. Remove the 2 screws retaining the switch and remove the switch from the instrument panel.

4. Installation is the reverse of the removal procedure.

Dimmer Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. On Comanche, Cherokee and Wagoneer, Remove the lower instrument panel trim cover.

3. On CJ7 and Wrangler, remove the 5 shroud screws and slide the shroud towards the steering wheel and apply slight upward pressure. Remove the shroud.

4. On the Wrangler, remove the evaporator housing mounting bolts and lower the housing.

5. On all models, disconnect the dimmer switch connector and remove the switch mounting screws. Remove the switch from the vehicle.

6. Installation is the reverse of the removal procedure.

7. To adjust the switch, depress the assembly slightly and insert a $\frac{3}{32}$ in. drill bit into the switch gauge adjusting hole. Move the switch toward the steering wheel. Once the slack is removed from the actuator rod tighten the switch retaining screws. Remove the drill bit.

8. Check the switch for proper operation.

Turn Signal Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the column-to-dash bezel. Loosen the toe plate screws.

3. With tilt columns, place the column in the non-tilt position. Remove the steering wheel.

4. Remove the lock plate cover.

5. Compress the lock plate and unseat the steering shaft snapping. Remove the compressor and snapping.

6. Remove the lock plate, canceling cam and upper bearing preload spring.

7. Place the turn signal lever in the right turn position and remove the lever.

8. Remove the hazard warning knob. Press the knob inward and turn counterclockwise to remove it.

9. Remove the wiring harness protectors. Disconnect the wiring harness connectors.

10. Remove the turn signal switch attaching screws and lift out the switch.

To install:

11. Install the turn signal switch and attaching screws. Torque the screws to 35 inch lbs.

12. Connect the wiring harness connectors. Install the wiring harness protectors.

13. With the turn signal switch in the middle, install the hazard warning knob. Press the knob inward and turn clockwise to install it.

14. Install the lever. Torque the attaching screws to 35 inch lbs.

15. Install the upper bearing preload spring, canceling cam and lock plate.

16. Using the lock plate compressor, install the snapping and lock plate cover.

17. Install the steering wheel. Loosen the toe plate screws. Install the column-to-dash bezel.

18. Connect the negative battery cable.

Combination Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Disconnect the electrical harness connector from its mounting on the lower part of the steering column.

3. Remove the horn pad. Remove the steering wheel. Remove the lock plate cover.

4. Using a lock plate tool, compress the lock plate and remove the snapping.

5. Remove the lock plate tool, lock plate, canceling cam and upper bearing preload spring.

6. Position the combination lever in the right turn position. Remove the combination lever retaining screws.

7. Carefully pull the combination lever assembly upward and out of the steering column.

To install:

8. Install the combination lever into the steering column.

9. Using the appropriate tool, install the lock plate, canceling cam and upper bearing preload spring.

10. Install the lock plate cover and install the steering wheel.

11. Install the horn pad and connect the electrical leads at the bottom of the steering column.

12. Connect the negative battery cable.

Ignition Lock

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the turn signal switch.

3. Remove the wiper switch harness and any additional harnesses from the column.

4. Insert the key and turn it to the ON position.

5. Remove the key warning buzzer and clip.

6. Remove the lock cylinder retaining screw and pull the lock cylinder out of the column housing.

To install:

7. Before installation, insert the key into the cylinder. Hold the cylinder sleeve so it won't turn and rotate the

key clockwise until it stops. This retracts the cylinder actuator.

8. Align the lock cylinder tab with the housing keyway.

9. Push the cylinder into the housing until it bottoms.

10. Install the cylinder retaining screw and torque it to 40 inch lbs.

11. Turn the key to ON.

12. Install the key warning buzzer switch and clip.

13. When installing the ignition switch, engage the actuator rod in the bottom of the switch. Install the switch on the column and tighten the screws.

14. Adjust the ignition switch as follows:

a. Insert the key and turn the lock cylinder to the **OFF/UNLOCK** position.

b. Loosen the switch mounting screws.

c. Move the switch down the column to eliminate any play and tighten the screws to 35 inch lbs.

d. Connect the wiring to the switch.

15. Engage the actuator rod in the dimmer switch and install the switch on the column.

16. Install the turn signal switch and attaching screws. Torque the screws to 35 inch lbs.

17. Connect the wiring harness connectors.

18. With the turn signal switch in the **N** position, install the hazard warning knob. Press the knob inward and turn clockwise to install it.

19. Install the lever. Torque the attaching screws to 35 inch lbs.

20. Install the upper bearing preload spring. Install the canceling cam. Install the lock plate.

21. Using the compressor, install the snapping. Install the lock plate cover and install the steering wheel.

29. Loosen the toe plate screws. Install the column-to-dash bezel.

31. Connect the negative battery cable.

Ignition Switch

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Position the key lock in the **OFF/LOCK** position.

3. Remove the lower trim panel, as required. Remove the ignition switch retaining screws.

4. Disconnect the ignition switch from the remote rod. Disconnect the electrical connectors from the switch assembly.

5. Remove the ignition switch from the vehicle.

To install:

6. With the actuator rod disconnected, position the switch to its mounting.

7. If the vehicle is equipped with a standard steering column, move the slider of the switch to the extreme left (ACC) position. The left side of the ignition switch is toward the steering wheel.

8. If the vehicle is equipped with a tilt steering column move the slider of the switch to the extreme right (ACC) position. The right side of the ignition switch is downward from the steering wheel.

9. Position the actuator rod in the slider hole. Install the switch to the steering column. Be sure not to move the slider out of the detent.

10. Hold the ignition key in the ACC detent position and push the switch assembly down the steering column in order to remove the slack in the actuator rod.

11. Connect the switch electrical connectors. Check the switch for proper operation. Install the trim panel, as required.

12. Connect the negative battery cable.

Typical fuse panel—Comanche, Cherokee and Wagoneer

Stoplight Switch

REMOVAL & INSTALLATION

CJ7, Wrangler, Cherokee, Comanche and Wagoneer

NOTE: The stoplight switch is not adjustable.

1. Disconnect the negative battery cable.

2. Disconnect the wires from the switch, mounted at the brake pedal pushrod.

3. Remove the pushrod bolt and remove the switch from the pushrod. Note the position of the spacers for installation.

To install:

4. Install the bushings and spacers on the new switch.

5. Position the switch on the pushrod. Secure the pushrod to the pedal with the bolt and locknuts.

6. Tighten the inner nut to 25 ft. lbs. (34 Nm) and the outer nut to 75 inch lbs. (8.5 Nm).

7. Connect the switch wires and check the operation of the switch.

8. Connect the negative battery cable.

Grand Wagoneer, J10 Pick-Up and J20 Pick-Up

1. Disconnect the negative battery cable.

2. Disconnect the wires from the

switch, mounted in the brake pedal bracket.

3. Unscrew the switch from the plastic retainer.

4. Install the new switch in position and adjust it by pulling the brake pedal back until a click is heard.

5. Connect the wires and connect the negative battery cable.

6. Check the operation of the switch and readjust if needed.

Fuses and Circuit Breakers

LOCATION

A fuse panel is used to house the fuses and circuit breakers protecting the various components of the electrical system in the vehicle. The fuse panel is located under the instrument panel on the drivers side of the vehicle.

ENGINE COOLING

Radiator

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Place a drain pan under the radiator and drain the radiator.

3. Remove the radiator upper and lower hoses.

4. Remove the alignment dowel E-clip from the lower radiator mounting bracket.

5. Disconnect the overflow tube from the radiator. Remove the fan shroud mounting bolts and pull the fan shroud back to the engine.

6. If equipped, disconnect the transmission cooler lines.

7. Remove the top radiator mounting bolts and remove the grille mounting screws. Remove the grille, if required.

8. If equipped, remove the condensor to radiator mounting bolts and pull the radiator out of the vehicle.

To install:

9. Slide the radiator into position behind the condensor, if equipped. Align the dowel pin with the bottom mounting bracket and install the E-clip.

10. Tighten the condensor-to-radiator bolts to 55 inch lbs. (6.2 Nm).

11. Install the grille. Install and tighten the radiator mounting bolts.

12. Connect the transmission cooler lines, if equipped. Install the fan shroud.

13. Connect the radiator hoses. Connect the negative battery cable.

14. Fill the cooling system to the correct level.

Heater and defroster assembly—typical Cherokee and Wagoneer

CJ7 and Wrangler

1. Disconnect the negative battery cable. Drain the radiator.

2. Disconnect the heater hoses. Disconnect the damper door control cables. Disconnect the blower motor wire.

3. Disconnect the defroster duct. Remove the heater core housing retaining nuts from inside the engine compartment.

4. Remove the heater core housing assembly from the vehicle.

5. Remove the heater core from the housing.

6. Installation is the reverse of the removal procedure.

Water Pump

REMOVAL & INSTALLATION

2.1L Engine

1. Disconnect the negative battery cable. Drain the engine coolant.

2. Remove the coolant hose from the water pump.

3. Remove the drive belts.

4. Remove the fan and hub assembly.

5. It is not necessary to remove the timing belt tensioner. Use a long strap and clip in order to retain the timing belt tensioner plunger in place.

6. Remove the water pump retaining bolts. Remove the water pump assembly from the vehicle.

To install:

7. Clean the mating surfaces of all gasket material.

8. Do not use sealer on the new gasket. Position the gasket and pump on the engine and install the bolts. Torque the bolts to 15 ft. lbs.

9. Check the timing belt tension.

10. Install the fan and hub.

11. Install the drive belts.

12. Install the coolant hoses.

13. Fill the cooling system.

14. Connect the negative battery cable.

2.5L, 4.0L and 4.2L

NOTE: Some 2.5L engines with air conditioning are equipped with a serpentine drive belt and have a reverse rotating water pump coupled with a viscous fan drive assembly. The components are identified by the words **REVERSE** stamped on the cover of the viscous drive and on the inner side of the fan. The word **REV** is also cast into the body of the water pump.

1. Disconnect the negative battery cable. Drain the cooling system.

2. Disconnect the hoses at the pump.

3. Remove the drive belts.

4. Remove the power steering pump bracket.

5. Remove the fan and shroud.

6. Unbolt and remove the pump.

To install:

7. Clean the mating surfaces thoroughly.

8. Using a new gasket, install the pump and torque the bolts to 13 ft. lbs.

9. Reconnect the hoses at the pump and install accessory drive belt.

10. Install the power steering pump bracket. Install the fan and shroud.

11. Adjust the belt tension and fill the cooling system to the correct level.

12. Connect the negative battery cable.

2.8L and 5.9L Engines

1. Disconnect the negative battery cable. Drain the cooling system.

2. Disconnect the upper radiator hoses at the radiator.

3. Loosen the accessory drive belts. Separate the fan shroud from the radiator and remove the fan assembly from the water pump.

4. Remove the water pump pulley. Remove the fan shroud.

5. Remove the alternator front mounting bracket. If equipped with air conditioning, remove the compressor bolts and pivot the compressor out of the way. Do not disconnect the compressor lines.

6. If equipped with power steering remove the stud/nut retaining the bracket and pivot the power steering/air pump assembly forward.

7. Disconnect the heater hose and bypass hose at the water pump. Disconnect the lower radiator hose at the water pump.

8. Remove the water pump mounting bolts and remove the pump from the engine.

To install:

9. Clean the gasket mating surfaces.

10. Install the water pump and gasket in position. Tighten the water pump-to-timing case bolts to 48 inch lbs. (5 Nm) and the water pump-to-block bolts to 28 ft. lbs. (38 Nm).

11. Install the power steering pump, air pump and bracket assembly.

12. Connect the heater hose, bypass hose and lower radiator hose. Pivot the air conditioning compressor into position.

13. Install the alternator front mounting brackets. Position the shroud against the engine and install the fan assembly.

14. Install the shroud to the radiator and install the accessory drive belts.

15. Connect the upper radiator hose. Connect the negative battery cable.

16. Fill the cooling system to the correct level and bleed the system.

Thermostat

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Remove the necessary hoses from the thermostat housing. Remove the 2 attaching screws and lift the housing from the engine.

2. Remove the thermostat and the gasket.

3. To install, place the thermostat in the housing with the spring inside the engine.

4. Install a new gasket with a small amount of sealing compound applied to both sides. Install the water outlet and tighten the attaching bolts to 30 ft. lbs. 5. Refill the cooling system.

Cooling System Bleeding

After working on the cooling system, even to replace the thermostat, it must be bled. Air trapped in the system will prevent proper filling and leave the radiator coolant level low, causing a risk of overheating.

1. To bleed the system, start with the system cool, the radiator cap off and the radiator filled to about an inch below the filler neck.

2. Start the engine and run it at slightly above normal idle speed. This will insure adequate circulation. If air bubbles appear and the coolant level drops, fill the system with an anti-freeze/water mixture to bring the level back to the proper level.

3. Run the engine this way until the thermostat opens. When this happens, coolant will move abruptly across the top of the radiator and the temperature of the radiator will suddenly rise.

4. At this point, air is often expelled and the level may drop quite a bit.

Keep refilling the system until the level is near the top of the radiator and remains constant.

5. If the vehicle has an overflow tank, fill the radiator right up to the filler neck. Replace the radiator filler cap.

GASOLINE FUEL SYSTEM

Fuel System Service Precaution

When working with the fuel system certain precautions should be taken; always work in a well ventilated area, keep a dry chemical (Class B) fire extinguisher near the work area. Always disconnect the negative battery cable and do not make any repairs to the fuel system until all the necessary steps for repair have been reviewed.

Relieving Fuel System Pressure

Fuel injection systems operate under high pressure, this makes it necessary to first relieve the system of pressure before servicing. The pressurized fuel when released may ignite or cause personal injury. The following outlined steps may be used for most fuel systems:

1. Disconnect the negative battery cable.

2. Remove the fuel tank filler cap.

3. Remove the cap from the pressure test port on the fuel rail in the engine compartment.

NOTE: Don't allow fuel to spray or spill on the engine or exhaust manifold. Place heavy shop towels under the pressure port to absorb any escaping fuel.

4. Using a suitable pressure gauge equipped with a pressure bleed valve, connect it to the test port valve to relieve fuel system pressure.

Fuel Filter

REMOVAL & INSTALLATION

Carbureted Engine

The fuel filter is located in the carburetor, at the inlet line.

1. Disconnect the negative battery cable.

2. Remove the fuel inlet line from carburetor.

3. Remove the large nut from the

inlet port, use care not to loose the spring behind the nut.

4. Remove and clean or replace the filter.

5. Installation is the reverse of the removal procedure.

Fuel Injected Engine

The fuel filter for the fuel injected engines is located at the rear of the vehicle, on the drivers side frame rail.

1. Disconnect the battery ground cable.

2. Remove the fuel tank filler cap.

3. Relieve the fuel system pressure.

4. Raise and support the rear of the vehicle safely.

5. Remove the hoses and clamps from the filter.

6. Remove the filter strap bolt and remove the filter.

NOTE: The filter is marked for installation. IN goes towards the fuel tank; OUT towards the engine.

7. Place the new filter on the frame rail and tighten the strap bolt to 106 inch lbs.

8. Install and securely clamp the hoses.

Mechanical Fuel Pump

PRESSURE TESTING

1. Disconnect the fuel inlet line at the carburetor.

2. Install a T-fitting on the open end of the fuel line and refit the line to the carburetor.

3. Plug a pressure gauge into the remaining opening of the T-fitting. The hose leading to the pressure gauge should not be any longer than 6 in. On pumps with a fuel return line, the line must be plugged.

4. Start the engine and allow it to idle. Fuel pressure readings should be as follows:

a. 4 and 6 cylinder engines — 4.00–5.00 psi @ idle

b. 8 cylinder engine — 6.00–7.50 psi @ idle

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Remove all the necessary components in order to gain access to the fuel pump. Disconnect the fuel lines.

2. Remove the attaching bolts that hold the fuel pump to the engine and lift the fuel pump off of the engine.

3. Before installing the fuel pump, make sure that all of the mating surfaces are clean.

To install:

4. Cement a new gasket to the mating surface of the fuel pump.

Electric fuel pumps—fuel injected vehicles

5. Position the fuel pump on the cylinder block so that the cam lever of the pump rests on the camshaft.

6. Secure the pump to the engine with the retaining bolts and lock washers.

7. Connect the fuel lines to the fuel pump.

Electric Fuel Pump

The fuel pump for fuel injected vehicles is located in the fuel tank attached to the fuel gauge sending unit.

PRESSURE TESTING

Throttle Body Injection

1. Remove the fuel pressure test port plug from the throttle body.

2. Install a pressure test fitting in the port.

3. Connect an 0–30 psi. gauge to the fitting.

4. Start the engine and allow it to idle.

5. The pressure gauge should read 14–15 psi. If the pressure is not in this range, adjust the pressure regulator to obtain the correct reading.

6. To adjust the pressure regulator, turn the screw at the bottom of the regulator in to increase the pressure and out to reduce the pressure.

Multi-Port Fuel Injection

1. Connect an 0–60 psi fuel pressure gauge to the test port pressure fitting on the fuel rail.

2. Remove the vacuum line from the fuel pressure regulator.

3. Start the engine and note the gauge reading.

4. The fuel pressure should be approximately 39 psi.

5. Reconnect the vacuum line to the pressure regulator, the fuel pressure should be approximately 31 psi.

6. If the fuel pressure is not approximately 8–10 psi higher with the vacuum line removed, check the line for kinks or pinches.

7. If the fuel pressure is below, momentarily pinch shut the hose section of the fuel line. If the pressure remains low, inspect the fuel supply system for blockage.

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable.

2. Remove the fuel tank filler cap.

3. Drain the fuel from the fuel tank.

4. Raise and safely support the rear of the vehicle.

5. Remove the fuel inlet and outlet hoses from the sending unit.

6. Remove the sending unit wires.

7. Using a brass punch and hammer, remove the sending unit retaining lock ring by tapping it counterclockwise.

8. Remove the sending unit, which incorporates the electric fuel pump, along with the O-ring seal from the fuel tank. Discard the O-ring.

9. Remove and discard the pump inlet filter.

10. Disconnect the fuel pump terminal wires.

11. Remove the pump outlet hose and clamp.

12. Remove the pump top mounting bracket nut and remove the pump.

To install:

13. Install a new inlet filter on the pump.

14. Assemble the pump and bracket. Connect the hose and wiring.

15. Install the unit and new O-ring in the tank. The rubber stopper on the end of the fuel return tube must be inserted into the cup in the fuel tank reservoir.

16. Install the lock ring. Carefully tap it into place until it seats against the stop on the tank.

17. Connect the hoses.

18. Connect the wiring.

19. Lower the vehicle, refill the fuel tank, run the engine and check for leaks.

Carburetor

REMOVAL & INSTALLATION

1. Disconnect the negative battery cable. Remove the air cleaner assembly.

2. Remove the necessary components in order to gain access to the carburetor retaining bolts. Disconnect and plug the fuel line. Disconnect all electrical connectors, as required.

3. Disconnect the accelerator linkage. Disconnect the automatic transmission linkage, as required.

4. Remove the carburetor retaining bolts. Remove the carburetor from the vehicle.

5. Installation is the reverse of the removal procedure. Be sure to use a new carburetor base gasket.

IDLE SPEED ADJUSTMENT

2.5L Engine with YFA Carburetor, TRC (Anti-Diesel) and CEC System

The TRC (anti-diesel) adjustment screw is statically set at $\frac{3}{4}$ of turn from the throttle valve closed position during the factory assembly and does not normally require readjustment. Should this adjustment be required, turn the adjustment screw counterclockwise to the throttle plate closed position and then turn the screw clockwise $\frac{3}{4}$ turn.

To adjust the solevac actuator, proceed as follows;

1. Connect a tachometer to the ignition coil tach wire connector.

2. Place the transmission in the N position and depress the parking brake.

3. Start the engine and allow it to reach normal operating temperature.

4. Connect an external vacuum

source to the solevac vacuum actuator and apply 10–15 in. Hg. Plug the engine vacuum hose.

5. Adjust the vacuum actuator to specification.

6. Remove the vacuum source from the vacuum actuator and retain the plug in the vacuum hose from the engine.

7. Adjust the curb idle speed to specification.

8. Stop the engine and connect the engine vacuum hose to the vacuum actuator.

9. Remove the tachometer from the engine.

2.8L Engine with 2SE Carburetor

1. Connect a tachometer to the ignition coil negative terminal or to the pigtail wire connector above the heater blower motor.

2. Disconnect and plug the vacuum hose at the distributor vacuum advance.

3. If necessary, adjust the ignition timing with the engine speed at or below specifications.

4. Reconnect the vacuum hose to the distributor vacuum advance unit.

5. Disconnect the deceleration valve hose and canister purge hose. Plug the hose and remove the air cleaner assembly.

6. If equipped with air conditioning, turn the control switch to the ON position and open the throttle momentarily to insure the solenoid armature is fully extended. Adjust the solenoid idle speed adjusting screw to obtain the specified engine curb idle speed rpm. Turn the air condition control switch to the OFF position.

7. If not equipped with air conditioning, adjust the engine idle speed rpm with the solenoid idle speed adjusting screw. Disconnect the solenoid wire and adjust the curb idle.

8. Install the air cleaner assembly. Connect all hoses and other connections.

2.8L Engine with E2SE Carburetor

NOTE: Some 1986 California models with the 2.8L engine, are equipped with a 2200 hour engine timer. The timer activates a solenoid to control operation of the carburetor secondary vacuum brake after 2200 hours of vehicle operation. The timer is not a serviceable component and must not be disassembled. In the event of a timer malfunction, the complete engine wiring harness must be replaced

1. Connect a tachometer to the igni-

tion system. Start the engine and operate to normal operating temperature.

2. Turn OFF all accessories. Position manual transmission vehicles in N and automatic transmission vehicles in D with the parking brake locked and the wheels chocked.

3. Adjust the curb idle speed adjusting screw to obtain the specified rpm.

4. Disconnect the vacuum hose from the idle kick actuator and connect an outside vacuum source to the actuator. Apply 15 in. Hg of vacuum to the actuator.

5. Adjust the actuator hex head adjustment screw to 1200 rpm with the selector lever in the N position.

6. Stop the engine, remove the tachometer and vacuum pump. Install the vacuum hose to the actuator.

4.2L Engine with BBD Carburetor and CEC System

1. Run the engine until normal operating temperature is reached. Connect a tachometer to the ignition coil negative terminal. The carburetor choke and intake manifold heater must be OFF. This occurs when the engine coolant heats to approximately 160°F.

2. Remove the vacuum hose to the solevac vacuum actuator unit. Plug the vacuum hose. Disconnect the holding solenoid wire connector.

3. Adjust the curb idle speed screw to specification.

4. Apply a direct source of vacuum to the vacuum actuator, using a hand vacuum pump or its equivalent. When the solevac throttle positioner is fully extended, turn the vacuum actuator adjustment screw on the throttler lever until the specified engine rpm is obtained. Disconnect the vacuum source from the vacuum actuator.

5. With a jumper wire, apply battery voltage to energize the holding solenoid. The holding wire connector can be installed and either the rear window defroster or the air conditioner (with the compressor clutch wire disconnected) can be turned on to energize the holding solenoid.

6. Hold the throttle open manually to allow the throttle positioner to fully extend. Without the vacuum actuator, the throttle must be opened manually to allow the solevac throttle positioner to fully extend.

7. If the holding solenoid idle speed is not within specifications, adjust the idle using the ¼ in. hex head adjustment screw on the end of the solevac unit.

8. Disconnect the jumper wire from the solevac solenoid wire connector, if used. Connect the wire connector to the solevac unit, if not connected. Install the original vacuum hose to the vacuum actuator.

9. Remove the tachometer and if disconnected, connect the compressor clutch wire.

5.9L Engine with 2150 Carburetor

NOTE: If the vehicle is equipped with automatic transmission, lock the parking brake, block the wheels and place the selector lever in DRIVE before adjusting the idle speed.

1. Connect a tachometer to the ignition coil negative terminal.

2. Start the engine and allow it to reach normal operating temperature.

3. Turn the hex head adjustment screw on the solenoid carriage to obtain the correct engine speed.

4. Disconnect the solenoid wire connector and adjust the curb idle speed screw to specification.

5. Reconnect the solenoid wire connector and stop the engine.

6. If equipped with a dashpot, position the throttle at the curb idle position and depress the dashpot stem.

7. Measure the clearance between the stem and the throttle lever. A clearance of 0.032 in. should exist.

8. Adjust the clearance as required by loosening the locknut and turning the dashpot until the correct clearance is obtained. Tighten the dashpot locknut.

IDLE MIXTURE ADJUSTMENT

2.5L Engine with YFA Carburetor and CEC System

The idle mixture is preset at the time of manufacture and should normally not require readjustment. To prevent easy access to the idle mixture screw, a tamper resistant plug is set into the carburetor assembly to cover the screw. Should adjustment be required due to system diagnosis, contamination, replacement of components or tampering, the following procedure may be used to bring the adjustment into compliance with specifications.

1. Connect a tachometer to the tach terminal of the ignition coil wire connector and a dwell meter to the mixture solenoid test terminals in the diagnosis connector (D2–14 and D2–7) and adjust the dwell meter to the 6 cylinder scale.

2. If the idle mixture screw tamper resistant plug has not been removed, the carburetor must be removed from the engine for access to the plug. With the carburetor off the engine, invert the carburetor and place it in a suitable holding device. Remove the plug by drilling a ⅛ in. hole in the center,

installing a self tapping screw and pulling the plug from the carburetor.

3. Reinstall the carburetor on the engine, connect all lines and wires.

4. Place the transmission in the N position and apply the parking brake.

5. Disconnect and plug the canister purge vacuum hose at the charcoal canister.

6. Start the engine and operate at fast idle speed to bring the engine and coolant to normal operating temperature, thus allowing the CEC (feedback) system to operate in the closed loop mode of operation.

7. Return the engine to idle speed and adjust the carburetor for an idle speed of 700 rpm for automatic transmission vehicles in D and 750 rpm in N for manual transmission vehicles.

8. Adjust the idle mixture screw to obtain an average dwell reading of between 25-35 degrees, with 30 degrees preferred.

9. If the dwell is too low, turn the idle mixture screw counterclockwise. If the dwell is too high, turn the idle mixture screw clockwise. Allow time for the system to react and stabilize after each movement of the adjusting screw. The feedback system is very sensitive to adjustments.

10. Observe the final dwell indication with the adjusting tool removed. If the specified dwell cannot be obtained by adjustment, inspect the carburetor idle circuits for air leaks, restrictions and etc. Do any necessary repairs.

11. When the adjustment is complete, connect the canister purge hose and adjust the idle speed to specifications.

12. Stop the engine and remove the tachometer and dwell meter. Plug the idle mixture adjusting screw openings. Install the gasket and the air cleaner assembly on the carburetor.

2.8L Engine with E2SE Carburetor (Feedback Type)

1. Remove the carburetor from the engine and remove the tamper resistant plug in order to gain access to the idle mixture adjusting screw.

2. Modify special Kent Moore tool J-29030-B or its equivalent, by grinding $\frac{1}{8}$ in. off the rear and $\frac{1}{4}$ in. off the front of the tool. Place the modified tool onto the idle mixture adjusting screw.

3. Turn the idle mixture screw in until it is lightly seated and back out 4 turns. If the seal in the air horn concealing the idle air bleed has been removed, replace the air horn. If the seal is still in place, do not remove the seal.

4. Remove the vent stack screen assembly to gain access to the lean mixture screw.

5. Turn the lean mixture screw in

until lightly bottomed and then back out $2\frac{1}{2}$ turns. Some resistance should be felt. If not, remove the screw and inspect for the presence of the spring.

6. Install the carburetor on the engine with the modified tool installed on the mixture adjusting screw. Do not install the air cleaner and gasket.

7. Disconnect the bowl vent line at the carburetor, disconnect the EGR valve hose and the canister purge hose at the carburetor. Cap the carburetor ports.

8. Refer to the vehicle emission control information label diagram, located under the vehicle hood, and locate the hose from port D on the carburetor to the temperature sensor and the secondary vacuum break thermal vacuum switch.

9. Disconnect the hose at the temperature sensor on the air cleanser and plug the hose.

10. Connect a dwell meter positive probe to the mixture control solenoid dwell test wire with a green connection.

11. Connect the negative probe to ground and set the meter at the 6 cylinder scale position.

12. Connect a tachometer to the ignition system, set the parking brake and chock the wheels.

13. Place the transmission in P for automatic or N for manual.

14. Start and operate the engine until normal operating temperature is reached and the electronic engine control system is in the closed loop mode of operation.

15. Operate the engine at 3000 rpm and adjust the lean mixture screw slowly in small increments, allowing time for the dwell to stabilize after turning the screw to obtain an average dwell of 35 degrees.

16. If the dwell is too low, back the screw out and if too high, turn the screw in. If unable to adjust to specifications, inspect the main metering system for leaks, restriction, etc.

17. Return the engine to idle speed. Allow the engine to stabilize before the dwell is recorded.

NOTE: The mixture control solenoid dwell is an indication of the ratio of ON to OFF time. The dwell of the mixture control solenoid is used to determine the calibration and is sensitive to changes in the fuel mixture caused by heat, air leaks, etc. While the engine is idling, it is normal for the dwell to increase and decrease fairly constant over a relatively narrow range, such as 5 degrees. However, it may occasionally vary as much as 10-15 degrees momentarily because of temporary mixture changes. The

dwell specified is the average of the most consistent variations. The engine must be allowed to stabilize its self for a few minutes after returning the engine to idle in order to obtain a correct average.

18. Adjust the idle mixture screw with the modified tool J-29030-A or its equivalent, to obtain an average dwell of 25 degrees. If the dwell is too high, turn the screw in and if the dwell is too low, back the screw out. Allow time for the dwell to stabilize after each adjustment, because the adjustment is very sensitive. If unable to adjust to specifications, check for idle system air or vacuum leaks and restrictions.

19. Disconnect the mixture control solenoid and check for and engine speed change of at least 50 rpm. If the rpm does not change enough, inspect the idle air bleed circuit for restrictions, leaks, etc.

20. Increase the engine speed to 3000 rpm and operate for a few minutes. Note the dwell which should be varying with an average indications of 35 degrees.

21. If the average dwell is not at 25 degrees, adjust the lean mixture screw.

22. After adjusting the lean mixture screw, adjust the idle mixture screw to obtain 25 degrees dwell.

23. If at an average dwell of 25 degrees, remove the carburetor from the engine, remove the modified tool J-29030-A or equivalent from the idle mixture screw and seal the access hole.

24. Install the carburetor, connect all disconnected components and install the vent screen. Verify the idle speed is within specifications.

4.2L Engine with BBD Carburetor and CEC System

The idle mixture adjustment should only be performed if the adjustment screws were removed during a carburetor overhaul procedure. When the carburetor is mounted to the engine, it must be removed to gain access to the dowel pin locations, whose removal must be accomplished before any adjustment of the mixture screws can be made.

1. Connect a tachometer to the engine. Run the engine until normal operating temperature is reached.

2. Set the parking brake firmly and chock the wheels. Position the gear selector in the N for manual transmission and in D for automatic transmission. Adjust the idle speed.

3. Adjust the idle mixture screws clockwise (lean) until a loss of engine rpm is noted. Idle drop specification is

50 rpm for both automatic and manual transmission.

4. Turn the idle mixture screws counterclockwise (rich) until the highest engine rpm indication is obtained.

NOTE: Do not turn the screws any further than the point at which the highest engine rpm is first obtained. This is referred to as best lean mixture. The engine idle speed will increase above the curb idle speed by an amount that corresponds approximately to the idle drop specifications listed on the Emission Information Label.

5. Turn the mixture screws clockwise (lean) to obtain the specified drop in engine rpm. Turn both mixture screws in small, equal amounts until the specified idle drop is achieved.

6. If the final engine rpm differs more than 30 rpm plus or minus from the original curb idle rpm, adjust the curb idle speed to specifications and repeat the mixture adjustment procedure.
